ENGINEERING & BUILDING RECORD

AND THE SANITARY ENGINEER

DEVOTED TO ENGINEERING ARCHITECTURE

A JOURNAL for the ARCHITECT, ENGINEER, MECHANIC and MUNICIPAL OFFICER

CONDUCTED BY HENRY C MEYER.

INDEX TO VOLUME XVI. 29693

JUNE 4, TO NOVEMBER 26, 1887.

82 & 84 Fulton Street, New York.

London Office, 92 & 93 Fleet Street.

SPECIAL ILLUSTRATIONS.

Arranged according to the names of Owners and Architects.

	PAGE
Anderson, R. R., architect of the New University Buildings, Edinburgh.....	234
Anthony's, E. W., residence at Longwood.....	578
Babb, Cook & Willard, architects of the Turner Building at Newburg, 178; of Hanan & Son's factory.....	290
Bent's, Mrs., residence at Longwood, Mass., hall in Brewer's, C. De H., manufactory building.....	430
Brown, A. Page, architect of McCormick Theological Seminary dormitory, 150; of the Thornwall Orphanage.....	675
Camden, N. J., house at.....	403
College of Physicians and Surgeons.....	739
Cowden's, Mrs., residence at Far Rockaway.....	707
Denver Club House.....	94
Edgar's William, residence at Newport.....	374
Edinburg University Buildings.....	234
Eyre, Wilson, architect of house at Camden.....	403
Gray & Page, architects of the Metropolitan Club, Washington.....	122
Hanan's & Son's shoe factory.....	290
Hartwell & Richardson, architects of Mr. Norton's residence at Allston.....	262
Hotel d'Almy, Blois, France.....	458
Hotel Pourtales, Paris.....	642
Jackson, T. J., architect of the staircase in the Examination Schools, Oxford.....	66
Jamaica Plain, Mass., old colonial house at.....	515
Long & Kees, architects of the Minneapolis Lumber Exchange.....	346
Lumber Exchange at Minneapolis.....	346
McCormick Theological Seminary in Chicago.....	150
McKim, Mead & White, architects of the Y. M. C. A. building at Newburg, 178; of Tiffany residence, 318, of Mr. Edgar's residence, 374; of Mrs. Cowden's residence.....	707
Marshall, Henry R., architect of a manufactory.....	430
Metropolitan Club, Washington, D. C.....	122
Newcomb, E. A. P., architect of Mrs. Bent's residence, 206; of Mr. Anthony's residence.....	578
New University Buildings at Edinburgh.....	234
Norton's, C. W., residence at Allston.....	262
Oxford Examination Schools staircase.....	66
Peabody & Stearns, architects of the Sloane residence.....	547
St. Etienne-du-Mont, Paris.....	610
Sloane's, W. D., residence at Lenox, Mass.....	547
Smith, W. Wheeler, architect of College of Physicians and Surgeons.....	730
Thornwall Orphanage at Clinton, S. C.....	675
Tiffany House in New York City, mantel in, 38; hallway in.....	318
Tiffany, Louis C., designer of the mantel in the Tiffany house.....	38
Turner Building at Newburg.....	178
Varian & Sterner, architects of the Denver Club.....	94
Washington, D. C., residence on M Street.....	487
Waste weir outlet of the Kangra Tank, Ahmedabad, India.....	10
Y. M. C. A. Building at Newburg, N. Y.....	178

VIGNETTES.

Arranged according to the names of Owners and Architects.

	PAGE
Andrews & Jacques, architects of Mr. Ropes' residence at York Harbor.....	150
Cottage at Rockaway, L. I.....	122
Balderson, Charles, architect of Mr. Stambach's residence.....	415
Bates, W. A., architect of the Wentworth stables.....	346
Birdseye's, I. W., residence at Bridgeport.....	10
Carriere & Hastings, architects of the Presbyterian Church at Oceanic.....	706, 707
Cook's, E. N., residence at Buffalo.....	234
Cope & Stewardson, architects of Mr. Hemphill's residence at Como.....	66
Cottage at Rockaway, L. I.....	122
Davis, E. W., residence at Narragansett Pier.....	642
Dexter's, George, residence at Longwood.....	38
Emerson, W. R., architect of a residence at Worcester.....	578
Ficken, H. E., architect of a windmill.....	66
Gardner's Cottage.....	610
Glen Ridge, N. J., Club House.....	458
Green & Wicks, architects of Mr. Cook's residence, 234; of Mr. Sawyer's residence.....	374
Harney, George E., architect of house at Morristown, N. J.....	290
Hazlett, W. C., architect of Glen Ridge club-house.....	458
Hemphill's, A. J., residence at Como, N. J.....	66
Lamb & Rich, architects of Mr. Schenck's residence.....	94
Laxey Water Wheel, Isle of Man.....	206
McKim, Mead & White, architects of a gardener's cottage.....	610
Metal screen.....	738, 739
Morristown, N. J., house at.....	290
Northrop, Joseph W., architect of Mr. I. W. Birdseye's residence.....	10
Pearson, George T., architect of a residence near Philadelphia.....	262
Philadelphia, a residence near.....	262
Presbyterian Church at Oceanic.....	707
Price, Bruce, architect of Mr. Davis's residence.....	642
Residence near Philadelphia.....	262
Robertson, R. H., architect of Mr. Van Ingen's residence at Washington, Conn.....	178
Ropes', John C., residence at York Harbor, Me.....	150
Sawyer's, G. P., residence at Buffalo.....	374
Schenck's, F., residence at Lawrence, L. I.....	94
Stambach's, S. P., Haverford College, Pa.....	414, 415
Stevens, John Calvin, residence at Portland.....	430
Tiffany Glass Company, designers of a metal screen.....	738, 739
Tobey, S. E., architect of Mr. Dexter's house at Longwood.....	38
Van Ingen's, E. H., residence at Washington, Conn.....	178
Wentworth Hall Stables.....	346
Windmills.....	66, 67
Woodruff, Edward L., architect of a windmill.....	66
Worcester, residence at.....	578

SCALE DRAWINGS AND DETAILS.

	PAGE
Chase House, Annapolis.....	318, 319
"Chatham" at Fredericksburg, mantels in.....	486
Craddock Estate, Medford, Mass.....	262, 263
Emmerton's, G. R., residence, garden entrance of.....	234, 235
House at Dorchester, Mass.....	402, 403
Little, Arthur, architect of Mr. Emmerton's residence at Salem.....	234
Mantel in the house of Dr. Johnson at Germantown.....	10, 11
Old Colonial Details from Fredericksburg and Annapolis.....	674, 675
Old Market Tower.....	546, 547
Ornamental iron work.....	579
Store in Philadelphia.....	94, 95
A	
Abattoirs in the United States.....	742
Action, Eng., sewage purification.....	438
Adler, D., on the requirements of a large opera house.....	746
Adulteration of food and the New York World.....	37
Adulteration of food, national legislation on.....	675
Advertising in technical journals in England, objectionable methods of.....	203
Aeration for purifying water.....	434
Air of factories, methods to moisten, 242; of sewers.....	487
Air brakes, Westinghouse, tests of.....	747
Air inlets.....	154
Air vent for steam radiators.....	492
Albany, N. Y., water supply in 1886.....	155
Allen, Charles, on sewage disposal.....	180
Allen's, C. A., report on Worcester sewerage.....	121
Ambulance railway train.....	713
America's cup and yacht models.....	515
American Association for the Advancement of Science.....	214, 297, 326
American Exhibition in London.....	9, 10
American Gas Light Association, proceedings, 214; meeting.....	524, 587
American Institute of Architects, 410, 466, 556; meeting of.....	610, 611
American Institute of Electrical Engineers.....	126
American Institute of Mining Engineers.....	130, 206
American Public Health Association meeting, 17, 584; and quarantine.....	705
American Pupils' prize at the Ecole des Beaux Arts.....	374, 375
American Railway Master Mechanics' Association.....	130
American Society of Civil Engineers meeting, 18, 46, 73, 121, 179, 214, 410, 466, 524, 583, 642, 651, 716; convention at Kaaterskill Hotel, 121, 149, 151, 156, 179, 180; report on Studentships.....	651
American Society of Mechanical Engineers' meeting.....	17, 43, 270, 715
American Water Works Association.....	125, 208
Angle bars of iron and steel in naval construction.....	157
Anglo American Brush Electric Light Company.....	747

	PAGE
Announcement of change of name.....	513
Apparatus for heating water at the wash bowl.....	324
Apprentices plumbers', certificates for.....	270
Apprenticeship question.....	295
Aqueduct bonds of Newark, 177; Arcueil, lining with lead, 641; Croton. (See Croton Aqueduct.)	
Archæological Institute of America.....	675
Architects in relation to building contracts, 93; of Western New York organize, 648; Western Association.....	294
(For architects' associations generally, see under name of association.)	
Architects' National Association proposed.....	684
Architectural League. (See New York Architectural League.)	
Architectural and engineering practice compared.....	647
Architectural Competitions. (See Competitions.)	
Architecture, study of, 14, 206; of London streets, 124; in the Reign of Queen Victoria, 236; of schools, books on, 437; mud, in Persia, 487; of railway stations, 513; amateur, for New York City building.....	707
Arcueil Aqueduct, lining with lead.....	641
Arkansas Society of Engineers and Architects.....	717
Armory roof, Buffalo, N. Y.....	614
Armories in New York City.....	458
Arthur Kill Bridge.....	125
Artesian wells in Iowa, 488; depths of.....	620
Arts and their application to common life.....	267
Ash pit contents, how to dispose of.....	153
Asphalt and concrete for street pavements, 266, 292, 376	
Association of Municipal and Sanitary Engineers and Surveyors, examination of candidates.....	69
Association of Sanitary Inspectors (English).....	150
Atlanta, Ga., Board of Health and bad wells, 318; reservoir wall bursts.....	438
Atmosphere, micro-organisms in.....	98
Augusta, Me., sewerage.....	520
Austrian telephone system, 707; bridge construction regulations.....	747
Automatic regulator for steam and hot water apparatus, etc.....	269
B	
Babcock & Wilcox on the Plant Milling Co.'s boiler explosion.....	555
Bacillus of typhoid fever.....	577
Baird, Prof. Spencer F.....	345
Baird, James B., on street sweeping machines.....	555
Balloon frames.....	68
Balloon with steam engine.....	610
Banner, T., drain tester.....	295
Bartlett, Hayward & Co. on switch valves.....	436
Basic slag as manure.....	94
Basin, apparatus for warming water at.....	324
Bath cells, walls of, and materials to protect.....	651, 654
Bath house of the Hospital St. Antoine, Paris.....	179
Bath room in residence of E. H. Wales.....	554
Baths proposed for Memphis, Tenn.....	274

PAGE	PAGE	PAGE	PAGE	
Baths in soldiers' barracks, how to warm..... 492	Building Inspector of Cincinnati, attempt to de- ceive..... 555	Competition for hotel at Redondo Beach, Cal..... 383	Electric cables, lead pipe for protecting, and joints of..... 463	
Beach, G. E., on storage reservoirs..... 210	Building inspection and the fall of the Harlem school..... 578, 584	for Milwaukee school..... 470	Electric light Act (English) effects of, 260; and power plants in the United States, 438; at Vienna, regulations for, 126; bill in Parliament, 325; circuits, regulations concerning in Bel- gium, 71; company in London, 747; Edison, in Germany, 214; for carriages, Low's, 290; for railway cars, 748; in Housatonic tunnel, 73; in Japan, 100; in Munich, 214; in omnibuses, etc., 430; in Vienna opera house, 438, 465; in Paris theatres, required by law, 465; in New York City, 515; in English post office, 588; lamps, cause of blackening of, 325; lamps, Thompson's, 556; National Association, 297; pupils of the Anglo-American Brush Co., 178	
Belgian regulations for electric light circuits..... 71	Building intelligence, 21, 48, 76, 88, 108, 110, 132, 160, 188, 169, 228, 245, 256, 276, 284, 301, 304, 379, 332, 357, 360, 368, 388, 473, 474, 424, 441, 452, 469, 480, 498, 528, 540, 560, 592, 624, 646, 688, 720, 752	at Gettysburg..... 439	Electric motor for street cars in Philadelphia, 154; in New York, 154; in Jersey City, 265; in Wheeling, W. Va..... 347	
Bell and Freret, Messrs., in the office of the Super- vising Architect..... 298	Building law, New York City..... 609	for Madison Square Garden..... 439	Electric power boat in France..... 651	
Bennington, Vt., monument..... 18	Building materials, machine for testing..... 17, 73	for railway depot at Hartford..... 439	Electric Subway bill for New York City, 130; ce- ment and iron pipe in, 233; regulations of Board of Electrical Control of New York City..... 2	
Berlin circus building..... 648	Building, permit for, in Minneapolis..... 347	for Allegheny, Pa., school..... 439	Electric water tank indicator, 580; whistle..... 684	
Berlin, testing water supply of..... 679	Buildings, sanitary registration of in London..... 15	for drainage at New Orleans..... 439	Electric wires, regulations for in New York City, 241; in the United Kingdom..... 126	
Bertillon, Dr., on the sanitary condition of cities..... 373, cf. 523	Burnham, D. H., on a new National Association of Architects..... 684	for Kanran City, Mo., church..... 404	Elevated railroad for Kings County. (See Kings County elevated railroad)..... 515	
Bienne and Macolin Railway..... 048	Burial of sewage and refuse..... 345	for Hamilton, Ont., building..... 495	Elevator car indicator, 72; fall of an in New York City, 352; in Equitable building..... 585, 649	
Billings, W. R., on details of water works construc- tion..... 462, 551, 582, 708	Burnley, Eng., crushing and sifting machines..... 489	for New York schools..... 495	Emercy, C. E., on the comparative value of steam and hot water for the transmission of heat and power..... 41	
Birmingham, Ala., gas, water and other improve- ments at..... 45	Burris, S. C., on machinery for making sewer pipe..... 745	for Rio Grande River..... 495	Engineer brigade reunion..... 410	
Birmingham, Eng., compressed air for power, 430; traction cable..... 643	Bury, Eng., cavalry shed roof..... 403	for railroad surveys..... 495	Engineering and architectural practice compared..... 647	
Blast furnace slag for pavements, 547; for cement..... 678	Butler, John on cost of solder..... 657	for Jersey City Hall of Records..... 525	Engineering advice wanted, 101; work in Bombay, 349; competition (see Competitions); education in..... 577	
Blasting, large charges for, in England..... 38	By passes in plumbing work..... 324	for New York City Hall, etc., 557, 654, 707	Engineers of municipalities, leaves of absence for, 65, 205, 211	
Blessing's water filter and purifier..... 213		for Brantford, Ont., House of In- dustry..... 557	Engineers' club for New York City, proposed..... 438	
Blue printing, Cleave's method of..... 46		for school house plans, New York..... 557	English plumbing practice..... 380, 435, 401, 585	
Boa captured in a sewer..... 494		for Fort Wayne City Hall..... 621	Equitable Life Insurance Company's building, do- mestic engineering in, 221, 553, 585, 618, 649, 680, 701, 720, 727, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000	Explosives of high power, composition of..... 742
Board for examination of candidates for medical officers of the army..... 170		for Los Angeles, Cal., hotel..... 621		
Boards of health, value of..... 547		for Hartford Railway depot..... 654		
Bogart, John, and the office of State Engineer..... 577, 685		for New York City Municipal build- ing..... 654, 707		
Boilers in residence of H. C. Fahnestock, 16; de- fective circulation of, 45; horizontal, method of making connections with, 72; circulation in the rectory of an uptown church, 154; in dio- cesan house, 295; how to keep supply cistern from freezing, 297; inspection in England, 715; fitting of, in England, 360, 435, 491, 586; two, how to arrange circulation for, 523; gal- vanized, and their effect on the water supply, 555; heating by steam, 587; noise in..... 620		for Madison Square Garden..... 654		
Bombay engineering works..... 349		for Milwaukee schools..... 686		
Books on water supply, 382; on school architec- ture..... 523		for Bristol, Tenn., hotel..... 686

DIRECTORY OF ADVERTISERS

IN

THE ENGINEERING AND BUILDING RECORD.

DECEMBER, 1886, TO DECEMBER, 1887.

AGENCIES—Purchasing and Forwarding.
Robert Evans, 92 Fleet Street, London, Eng.

ARCHITECTS.
Glenn Brown, 607 Louisiana Avenue, Washington, D. C.
Charles E. Illsley, C. E., 506 Olive Street, St. Louis, Mo.

ASBESTOS MATERIALS.
Chalmers-Spence Co., foot of East 8th Street, New York.
H. W. Johns Mfg. Co., 87 Maiden Lane, New York.

AIR COMPRESSORS.
Rand Drill Co., 23 Park Place, New York.

ART PRODUCTS.
Grady & McKeever, 719 Sixth Avenue, New York.

ASPHYXIATOR—Drain Tester.
John Watts & Co., Bristol, England.

BANKERS.
Brown Bros., 59 Wall Street, New York.

BOILERS—Steam.
Abendroth & Root Mfg. Co., 28 Cliff Street, New York.
Babcock & Wilcox Co., 30 Cortlandt Street, New York;
Glasgow.

BRASS GOODS.
E. M. Franklin Mfg. Co., 47 Clymer Street, Brooklyn.

BRICK.
Chicago Anderson Pressed Brick Co., 157 La Salle St., Chicago
Hydraulic Pressed Brick Co., 304 N. Eighth St., St. Louis.
Peerless Brick Co., 1003 Walnut Street, Philadelphia.
Pitcher & Creager, Baltimore, Md.

BRICK MACHINES.
P. L. Sword & Son, Cleveland, Ohio.

BRIDGES, ROOFS, ETC.
Columbia Iron & Steel Co., Pittsburg, Pa.
Pittsburg Bridge Co., Pittsburg, Pa.
Rochester Bridge & Iron Works, Rochester, N. Y.
Union Bridge Co., 1 Broadway, New York.

BUILDERS' HARDWARE.
Chas. H. Hinds, 418 W. Twenty-seventh Street, New York.
A. G. Newman, 1180 Broadway, New York.
W. R. Ostrander, 21 Ann Street, New York.
Mortimer Sullivan, 258 W. 125th Street.
Van Wagoner & Williams, 82 Beekman Street, New York.

BLASTING.
Rendrock Powder Co., 23 Park Place, New York.

CARPENTERS.
Frank N. Moore, 14 Stone Street, New York.

CELLAR DRAINER.
Clarence M. Kemp (Climax), Baltimore, Md.

COLORS—Mortar.
Samuel H. French & Co., Philadelphia, Pa.
Walpole Dye and Chemical Works, 44 Oliver Street, Boston.

CEMENT.
Belloni & Co., 41 South Street, New York.
Howard Fleming, 23 Liberty Street, New York.
Erskine Fisher, 18 Broadway, New York.
Lesley & Trinkle, 210 South 3d Street, Philadelphia.
Meacham & Wright, 98 Market Street, Chicago.
F. O. Norton, 92 Broadway, New York.
New York & Rosendale Cement Co., 229 Broadway, N. Y.

CARPETS AND UPHOLSTERY.
W. & J. Sloane, Broadway and 19th Street, New York.

DECORATORS—Interior.
Edwin Ford, Boylston Street, Boston.
John Gibson, 123 South 11th Street, Philadelphia.
Hodges & Rafalsky, 1193 Broadway, New York.
George A. Schastey & Co., 53d St. and B'way, New York.

DREDGING PLANT.
Osgood Dredging Co., Albany, N. Y.
Union Dredging Co., 34 Pine Street, New York.

DRAUGHTSMEN'S SUPPLIES.
T. Alteneder, 355 North 10th Street, Philadelphia.
F. W. Devoe & Co., Fulton and William Sts., New York.
G. S. Woolman, 116 Fulton Street, New York.

EARTH CLOSETS.
Heap's Patent Earth-Closet Co., Muskegon, Mich.

ELECTRO-PLATING.
Cook & Totten, 23 Jacob Street, New York.

ELEVATORS.
L. S. Graves & Son, 41 Cortlandt Street, New York.
Moore & Wyman, 37 Foundry Street, Boston.
Otis Bros. & Co., Potter Building, New York.

ELECTRIC-LIGHT PLANT.
Brush Electric-Light Co., Cleveland, Ohio
Jackson & Morgan, 16 Exchange Place, New York City.

ENGINES—Holsting.
Edward A. Kendall & Son, Cambridgeport, Mass.
Lidgerwood Mfg. Co., 96 Liberty Street, New York.
J. S. Mundy, Newark, N. J.
Alexander Traud, Newark, N. J.

ENGRAVING—Photo.
American Photo-Engraving Co., 13 Vandewater St., N. Y.
Moss Engraving Co., 535 Pearl Street, New York.

ENGINEERS.
William J. Baldwin, M. E., 82 Fulton Street, New York.
Carroll Phillips Bassett, C. E., Broad and Market Streets,
Newark, N. J.
Dana C. Barber, S. E., P. O. Box 225, Washington, D. C.
Mason L. Brown, C. E., 17 Telegraph Bldg., Detroit, Mich.
Frank Brewer, C. E., 44 Broadway, New York.
F. A. Calkins, 84 Fulton Street, New York.
F. Collingwood, C. E., 82 Filton Street, New York.
Theodore Cooper, C. E., 35 Broadway, New York.
Allan D. Conover, C. E., Madison, Wis.
J. J. R. Croes, C. E., 13 William Street, New York.
Crafts & Forbes, C. E., 101 Milk Street, Boston.
G. W. G. Ferris & Co., Pittsburg, Pa.
T. Waln-Morgan Draper, C. E., 145 Broadway, New York.
Chester B. Davis, C. E., 75 Calumet Bldg., Chicago.
Wm. Paul Gerhard, C. E., 39 Union Square, New York.
Rudolph Hering, C. and S. E., City Hall, Chicago.
J. B. Johnson, C. E., St. Louis, Mo.
A. H. Martine, C. E., Knoxville, Tenn.
Robert Moore, 325 Chestnut Street, St. Louis, Mo.
Frederick N. Owen, C. E. and S. E., 13 William Street,
New York.

Charles McMillan, C. E., Princeton, N. J.
Alan Macdougall, City Engineer's Office, Toronto, Can.
John Naegleley, 97 Fourth Ave., Pittsburg, Pa.
Edward S. Philbrick, C. E., 12 West Street, Boston, Mass.
Rosewater & Christie, Hyd. and M. E., Omaha, Neb.
William Rumble, 22 Cortlandt Street, New York.
C. C. Schneider, 35 Broadway, New York.
Shunk & Bryson, C. E., 1 Broadway, New York.
Charles H. Swan, C. E., 25 Wabon Street, Boston, Mass.
Stevenson Towle, C. E., 115 Broadway, New York.
Albert L. Webster, C. E., 107 Drexel Bldg., New York.
White & Raeder, C. E., 74 Wall Street, New York.

ENGINEERS AND CONTRACTORS.
Samuel R. Bullock & Co., 11 Wall Street, New York.
Charles H. Eglee, Flushing, N. Y.
James Gamble, 68 Wall Street, New York.
Moffett, Hodgkins & Clarke, Watertown.
John W. Rutherford, 145 Broadway, New York.
William H. White, 32 Pine Street, New York.
Oscar Darling, 44 Broadway, New York.
Peter Milne, 200 Broadway, New York.

EXHIBITIONS.
St. Petersburg (A. Warschawsky, American Agent, 14 Dey
Street, New York.)

FANS—Ventilating.
Exhaust Ventilator Co., 45 Fulton Street, New York.
Hope Ventilator Co., Kansas City, Mo.
Huyett & Smith Mfg. Co., Detroit, Mich.

FILTERS.
Albany Steam Trap Co. (Duplex Filter), Albany, N. Y.
Crocker Filtering Co., 16 Exchange Place, New York.
Hyatt Pure Water System, Tribune Building, New York.
National Water Purifying Co., 145 Broadway, New York.
Wainwright Mfg. Co., 65 Oliver Street, Boston, Mass.

FIRE-PROOF MATERIALS.
Pioneer Fire-Proof Construction Co., Clark and 16th Street,
Chicago.
Raritan Hollow and Porous Brick Co., 115 Broadway, N. Y.

FURNACES.
Abendroth Bros., 109-111 Beekman Street, New York.
Barstow Stove Co., Beekman and Water Streets, New York.
Richardson & Boynton, 234 Water Street, New York.

FURNITURE—Office.
T. G. Sellew, 111 Fulton Street, New York.

FURNISHING GOODS—Gents'.
Arnold, Constable & Co., Broadway and 19th St., New York.

FOOD PRODUCTS.
Thurber, Whyland & Co., W. Broadway and Chambers Street,
New York.
Liebig & Co. (Meat Extract).

FORGES.
Buffalo Forge Co., Buffalo, N. Y.

GLASS.
Pittsburg Plate Glass Co., Creighton, Pa.
Tiffany Glass Co., 333 Fourth Avenue.
A. H. Wallis, 2127 Lucas Avenue, St. Louis, Mo.
Washburn Glass Co., 401 N. 2d Street, St. Louis, Mo.
Edwin Ford, Boston, Mass.
C. H. Postel & Co., 1314 Ridge Avenue, Philadelphia.

GRATES.
Edwin A. Jackson, 50 Beekman Street, New York.

GAS FIXTURES.
Mitchell, Vance & Co., 836-838 Broadway, New York.

GAS MACHINES.
Combination Gas Machine Co., Detroit, Mich.
Gilbert & Barker Mfg Co., 74 Maiden Lane, New York.
Tirrill Gas Machine Co., 39 Dey Street, New York.

GAS ENGINES.
Schleicher, Schumm & Co. (Gas Engines), Philadelphia, Pa.

GAS PUMPING ENGINES.
Delamater Iron Works, foot W. 13th Street, New York.
Hill & Welsh, 36 Pearl Street, New York.
Rider Engine Co., 37 Dey Street, New York.
A. C. Manning & Co., 18 Vesey Street, New York.

GAS STOVES.
Goodwin Gas Stove & Meter Co., 1012 Filbert Street, Phila-
delphia, Pa.

HOTELS.
Schweizerhof, Lucerne, Switzerland.

HEATING APPARATUS—Steam and Hot Water.
Edwin P. Bates, 592 Water Street, Syracuse, N. Y.
Barron & McKendrick, 100 Walker Street, New York.
Bartlett, Hayward & Co., Baltimore, Md.
Robert Coddington, (Williams System), 44 Broadway, N. Y.
Combination Co., Norwich, Conn.
Denny Bros., 34 Park Place, New York.
Duplex Steam Heater Co., 10 Barclay Street, New York.
Thos. Gifford & Co. (Park's Steam Heater), New Bedford,
Mass.

Gillis & Geoghegan, 116 Wooster Street, New York.
Globe Steam Heater, North Wales, Pa.
E. E. Gold & Co., Frankfort and Cliff Streets, New York.
Gorton & Lidgerwood Co. (Gorton Boiler), 96 Liberty Street
New York.

Gurney Hot Water Heater Co., 237 Franklin Street, Boston.
Herendeen Manufacturing Co. (Furman Boiler), Geneva, N. Y.
John J. Hogan, 87 Centre Street, New York.
Orlando Kelsey, 510 Arch Street, Philadelphia.
Hitchings & Co., 233 Mercer Street, New York.
Le Bosquet Bros., 75 Union Street, Boston.
J. C. McNeil Co. (Akron Boiler), Akron, O.
McEwan Steam Heating Co., Detroit, Mich.
D. F. Morgan (Auburn Boiler), Akron, O.
M. Mahony, 5th Street, Troy, N. Y.
New York Central Iron Works (Dunning Boiler), Geneva, N. Y.
E. F. Osborne, St. Paul, Minn.

Pierce, Butler & Pierce Manufacturing Co. (Florida Boiler),
Syracuse, N. Y.
H. B. Smith Co., 137 Centre Street, New York.
John A. Scollay, 74 & 76 Myrtle Avenue, Brooklyn.
St. Louis Steam Heating and Ventilating Co., 901 N. Main
Street, St. Louis.

Thos. W. Weathered, 46 Marion Street, New York.
Weston Engine Co. (Bronson Boiler), Painted Post, N. Y.

HEAT REGULATING APPARATUS.
National Electric Service Co., Equitable Bldg., New York.

IRON WORK—Structural and Ornamental.
J. B. & J. M. Cornell, 139 Centre Street, New York.
Cheney & Hewlett, 201 Broadway, New York.
J. G. & T. Diamond, 209 W. 33d Street, New York.
Hecla Bronze and Iron Works, 216-218 W. 23d St., New York.
Jackson Archt. Iron Works, 315 E. 28th Street, New York.
Manly & Cooper Manufacturing Co., Philadelphia.
National Wire and Iron Co., Detroit, Mich.
Pennsylvania Construction Co., 132 First Ave., Pittsburg, Pa.

INSTRUMENTS—Engineers' and Surveyors'.
T. Alteneder, 355 N. 10th Street, Philadelphia.
G. S. Woolman, 116 Fulton Street, New York.

INSTRUCTION—Technical.
Institute of Technology, Boston.
School of Mines, Columbia College, New York.
Stevens Institute, Hoboken, N. J.

INSURANCE.

Berkshire Life Insurance Co., 271 Broadway, New York.
Mutual Life Insurance Co., New York.
New York Life Insurance Co., 364 Broadway, New York.
Fire Assurance Association of London.
A. P. M. Roome, 178 Broadway, New York.

LAUNDRY MACHINERY.

Troy Laundry Machinery Co., Troy, N. Y.

MARBLE.

Batterson, See & Eisele, 431 Eleventh Avenue, New York.
Endolithic Marble Co., 337 E. 27th Street, New York.
A. L. Fauchere & Co., 431 Eleventh Avenue, New York.
Green Serpentine Marble Co., 1430 S. Penn Square, Philadelphia.

MOTORS—Water.

Amherst Hydraulic Motor Co., Holyoke, Mass.
Geo. J. Robert & Co., Dayton, O.

MACHINISTS.

Myers & Lee, 17 Huron Street, Cleveland, O.

PHOTOGRAPHIC OUTFITS.

Loeber Bros., 121 Nassau Street, New York.

PHOTOGRAPHS.

Soule Photo Co., 338 Washington Street, Boston.
J. W. Taylor, 157 La Salle Street, Chicago.

PUBLICATIONS AND PUBLISHERS.

H. C. Baird & Co., 880 Walnut Street, Philadelphia.
"Birmingham Age," Birmingham, Ala.
Century Company, 33 E. 17th Street, New York.
Harper & Bros., Franklin Square, New York.
D. Van Nostrand, 35 Murray Street, New York.
E. & F. N. Spon, 35 Murray Street, New York.

PIPE—Lead and Sheet.

Salem Lead Co., Salem, Mass.

PAINTS.

F. W. Devoe & Co., Fulton and William Sts., New York.

PAINTERS AND DECORATORS.

Wm. H. Oliver & Co., 62-64 University Place, N. Y. City.

PIPE AND BOILER COVERINGS.

Chalmers-Spence Co., Foot of East Eighth St., New York.
Fossil Meal Co., 48 Cedar Street, New York.
H. W. Johns Mfg. Co., 87 Maiden Lane, New York.
Shields & Brown Co., 143 Worth Street, New York.
U. S. Mineral Wool Co., 22 Cortlandt Street, New York.

PIPE CUTTING MACHINES, TOOLS, ETC.

Forbes & Curtis, Bridgeport, Conn.
Jarecki Mfg. Co., Erie, Pa.
Pancoast & Maule, Philadelphia, Pa.

PAVING—Asphalt.

Barber Asp. Pav. Co., 280 Broadway, New York.
Neuchatel Asphalt Co., 265 Broadway, New York.
E. H. Wooten, 53 Cedar Street, New York.
Warren-Scharf Asphalt Pavement Co., 114 John St., N. Y.

PATENTS—Solicitors.

F. B. Brock, Washington, D. C.
Brown Bros., 28 School Street, Boston, Mass.
H. Connett, 5-7 Beekman Street, New York.

PENS.

Iverson, Blakeman, Taylor & Co., 753-755 Broadway, N. Y.

PIPES—Cast Iron, for Water and Gas.

Cincinnati and Newport Iron and Pipe Co., Newport, Ky.
Chattanooga Foundry and Pipe Works, Chattanooga, Tenn.
Detroit Pipe and Foundry Co., Newberry and McMillan Building, Detroit, Mich.

M. J. Drummond, 95 Liberty Street, New York.
Emaus Pipe Foundry, Emaus, Lehigh Co., Pa.
Gloucester Iron Works, 6 N. Seventh St., Philadelphia, Pa.
Dennis Long & Co., Louisville, Ky.
Mellert Foundry and Machine Co. (Ltd.), Reading, Pa.
Pancoast & Rogers, 28 Platt Street, New York.
Sayre Pipe Foundry Co., Sayre, Pa.
South Pittsburg Pipe Works, Pittsburg, Tenn.
Wells Rustless Iron Co., 7-9 Cliff Street, New York.
Warren Foundry and Machine Co., 160 Broadway, N. Y.
R. D. Wood & Co., Philadelphia, Pa.

PIPE—Wrought Iron.

Pancoast & Rogers, Agents Reading Iron Co., 28 Platt St., New York.

PUMPING MACHINERY—Steam.

A. Aller, Liberty Street, below Church, New York.
A. S. Cameron, foot of E. 23d Street, New York.
Davidson Steam-Pump Co., 77 Liberty Street, New York.
Deane Steam-Pump Co., 92-94 Liberty Street, New York.
Delamater Iron Works, foot of W. 13th Street, New York.
Hall Steam-Pump Co., 91 Liberty Street, New York.
Holly Mfg. Co., 44 Broadway, New York.
Holmes & Blanchard, 37 Charlestown Street, Boston.
Knowles Steam-Pump Co., and George F. Blake Co., 93 Liberty Street, New York.
Pulsometer Steam-Pump Co., 83 John Street, New York.
Smith, Vaile & Co., Dayton, O.
Valley Machine Co., Easthampton, Mass.
Volker & Felthousen Mfg. Co., Buffalo, N. Y.
Henry R. Worthington, 86 Liberty Street, New York.

PLUMBERS' TOOLS.

C. S. Osborne, Newark, N. J.

PLUMBERS' MATERIALS, SANITARY SPECIALTIES, Etc.

E. Aspinall, 98-100 Beekman Street, New York.
C. A. Blessing, Montgomery Avenue and Randolph Street, Philadelphia, Pa.
Clark Bros. (Hot-Water Regulator), 218 S. 12th St., Phila.
Connolly Mfg. Co., 351-353 Adam Street, Brooklyn.
W. S. Cooper Brass Works, 259 N. Broad Street, Phila.
Dalton & Ingersoll, 17-19 Union Street, Boston, Mass.
Doulton & Co., Albert Embankment, Lambeth, London, England.
Enterprise Pottery Co., Trenton, N. J.
E. M. Franklin Mfg. Co., 47-53 Clymer Street, Brooklyn.
Thomas Gibson Co., Cincinnati, O.
Haines, Jones & Cadbury, Philadelphia, Pa.
Henry Huber & Co., 81 Beekman Street, New York.
Iron Clad Mfg. Co., 22 Cliff Street, New York.
Edward Johns, Armitage, near Rugeley, Staffordshire, Eng.
Kilbourne & Jacobs Mfg. Co., Columbus, O.
Thomas Maddock & Sons, 273 Pearl Street, New York.
Meyer-Sniffen Co. (Limited), 46-48 Cliff Street, New York.
J. L. Mott Iron Works, 88-90 Beekman Street, New York.
Myers Sanitary Depot, 66 Centre Street, New York.
Reynolds & Co., 25 Centre Street, New York.
Ronalds & Co., 54 Cliff Street, New York.
Rufford & Co., Stourbridge, Eng.
Sands Bros., 6 Reade Street, New York.
Sanitas Manufacturing Co., 4 Pemberton Square, Boston.
Stambach & Love, 52 N. 7th Street, Philadelphia.
Standard Manufacturing Co., Pittsburg, Pa.
E. Stebbins Mfg. Co., Springfield, Mass.
Henry Steeger, 143-145 E. 31st Street, New York.
Sharpless, Watts & Co., 1522 Chestnut Street, Philadelphia.
John Trageser, 447-457 W. 26th Street, New York.
United Brass Co., Fulton, cor. Gold, New York.
Louis Waefelaer Co. (Ltd.), 54 Beekman Street, New York.
Charles H. Winn & Co., Holborn Viaduct, E.C., London, Eng.

PLUMBERS.

Oliver Barrett, 74 W. 4th Street, New York.
Paul S. Bolger, 318 Madison Avenue, New York.
Hardness Boyd, 505 Madison Avenue, New York.
M. J. Corboy, 69 Washington Street, Chicago, Ill.
William F. Conran, 307 Pearl Street, New York.
George H. Dunn, 97 Worth Street, New York.
Thomas Hindley & Son, 794 Sixth Avenue, New York.
Leonard D. Hosford, 66 Beekman Street, New York.
Hughes & Stephenson, 745 Craig Street, Montreal, Can.
Henry Hussey & Co., 89 Kingston Street, Boston.
Moody & Bracken, 951 Sixth Avenue, New York.
John Renahan, 163 E. 35th Street, New York.
Smith & Connors, Cleveland, O.
John Toumey, 124 Park Avenue, New York.
Tucker & Titus, 14 Brattle Square, Boston.

RADIATORS.

F. B. Bannan, Pottsville, Pa.
A. A. Griffing Iron Co., Communipaw Avenue, Jersey City.
Detroit Steam Radiator Co., Detroit, Mich.
Nason Mfg. Co., 71 Beekman Street, New York.
J. H. Reed & Co., Lima, O.
Rutzler & Blake, 176 Centre Street, New York.
H. B. Smith Co., 137 Centre Street, New York.
Wainwright Mfg. Co., 65-67 Oliver Street, Boston.

RAIN-WATER SEPARATOR.

C. G. Roberts, Haslemere, Surrey, England.

REGISTERS.

Tuttle & Bailey Mfg. Co., 83 Beekman Street, New York.

REGULATORS—Pressure Reducing Valve.

Clark Bros. (Hot Water), 218 S. 12th Street, Philadelphia.
Curtis Regulator Co., 40 Beverly Street, Boston.
Mason Regulator Co., Boston, Mass.
Timothy Kieley, 7-11 West 13th Street, New York.

RUBBER GOODS—Hose, Belting, Etc.

New York Belting and Packing Co., 15 Park Row, New York.

ROCK DRILLS AND CUTTING PLANT.

T. A. Jackson, 388 Eleventh Avenue, New York.
Rand Drill Co., 23 Park Place, New York.

ROOFING MATERIALS.

John Farquhar's Sons 20-22 East Street, Boston, Mass.
Jones & Perrett, 106-108 Liberty Street, New York.
Merchant & Co. (Roofing-Plates), Philadelphia.

RANGES.

Abendroth Bros., 108 Beekman Street, New York.
Barstow Stove Co., cor. Beekman and Water Sts., New York.
D. Moneuse, 128 South Fifth Avenue, New York.
Richardson & Boynton, 234 Water Street, New York.

SEWERAGE SYSTEM—Shone's Pneumatic.

Hughes & Lancaster, Chester, Eng.; 72 Commerce Building, Chicago.

STEAM AND GAS SPECIALTIES.

The Ashcroft Manufacturing Co., 111 Liberty St., New York.
Consolidated Safety-Valve Co., 111 Liberty St., New York.
Crane Bros. Mfg. Co., Chicago, Ill.
Crosby Steam Gauge and Valve Co., 95 Oliver St., Boston.
Kelly & Jones, 75 John Street, New York.
Timothy Kieley, 7 West 13th Street, New York.
Thomas L. McKeen, McKeesport, Pa.
Pancoast & Maule, 243 South Third Street, Philadelphia.
Rutzler & Blake, 176 Centre Street, New York.
Walworth Mfg. Co., 16 Oliver Street, Boston.

STEAMSHIPS.

Cunard Steamship Co., 4 Bowling Green, New York.

SHUTTERS—Iron and Wood.

Dodd Manufacturing Co., 19 Park Place, New York.
Clark, Bunnell & Co., 162-164 W. 27th Street, New York.

SASH WEIGHTS—Lead.

J. N. Raymond, 55-57 Lake Street, Chicago, Ill.

SKYLIGHTS.

Geo. Hayes & Son, 71 Eighth Avenue, New York.
Knisley & Miller, 129-131 S. Clinton Street.

SMELTING FURNACES.

The Hartsfield Portable Smelting Furnace Co., Newport, Ky.

STONES—Building.

Chris Binder & Sons, East Blue Hill, Me.
M. H. St. John, 265 Broadway, New York City.

STOVES.

Omega Stove and Grate Co., 89 Euclid Avenue, Cleveland, O.

SINKS.

Kilbourne & Jacobs Mfg. Co., Columbus, O.

SEWER PIPE—Drain and Culvert.

American Sewer Pipe Co., Akron, O.
Blackmer & Post, 325 Chestnut Street, St. Louis.
Calumet Fire-Clay Co., Calumet, O.
Empire Fire Clay Co., Empire, O.
Jackson Bros., Albany, N. Y.
Pennsylvania Manufacturing, Mining, and Supply Co., 1004-1008 Penn Avenue, Pittsburg, Pa.
H. A. Warner, New Haven, Conn.

TRAPS—Sewer Gas.

James Barrett, 207 Tremont Street, Boston.
B. P. Bower, Cleveland, O.
N. Barry & Son, Muscatine, Iowa.
F. E. Cudell, 204 Superior Street, Cleveland, O.
DuBois Mfg. Co., 245 Ninth Avenue, New York.
Erie City Foundry, Erie, Pa.
New York Sanitary Mfg. Co., 273 Pearl Street, New York.

TESTING MACHINES—Cement.

Riehle Bros., 50 South Fourth Street, Philadelphia, Pa.

TILES.

American Encaustic Tiling Co., 116 W. 23d Street, N. Y.
A. Booth, 11 East Nineteenth Street, New York City.
Miller & Coates, 279 Pearl Street, New York.

TERRA COTTA.

Boston Architectural Terra Cotta Works, 384-390 First Street, Boston.
Pennsylvania Manufacturing, Mining and Supply Co., 1004-1008 Penn Avenue, Pittsburg, Pa.
Trenton Terra Cotta Co., Trenton, N. J.

TRENCH EXCAVATING MACHINES.

H. A. Carson, 21 Hamilton Street, Boston.

VARNISHES.

John L. Armitage, Newark, N. J.

VENTILATORS.

E. Van Noorden, 380 Harrison Avenue Boston, Mass.

WARMING APPARATUS.

E. P. Bates, 59 W. Water Street, Syracuse, N. Y.

VALVES—Water, Gas, and Steam.

Chapman Valve Co., Indian Orchard, Mass.
Consolidated Safety-Valve Co., 111 Liberty St, New York.
D'Este & Co., Boston.
Frontier Iron and Brass Works, Detroit, Mich.
Galvin Brass and Iron Works, Detroit, Mich.
Hay & Prentice, Chicago.
Holland & Thompson, Troy, N. Y.
Ludlow Valve Mfg. Co., Troy, New York.
Mason Regulator, 22 Central Street, Boston.
T. R. McMann & Bro., 56-60 Gold Street, New York.
H. Patterson, Albany, N. Y.
Peet Valve Co., 163 Albany Street, Boston.

WATER-METERS.

National Meter Co. ("Crown"), 252 Broadway, New York.
S. A. Strang ("Deacon"), 30 Pine Street, New York.
Water-Waste Prevention Co. ("Thomson"), 143 Nassau Street, New York.
H. R. Worthington ("Worthington"), 86 Liberty Street, New York.

WINDMILLS.

A. J. Corcoran, 76 John Street, New York.

WIRE CLOTH.

Clinton Wire Cloth Co., 59 Beekman Street, New York.
New Jersey Wire Cloth Co.
Taylor & Dean, 205 Market Street, Pittsburg.

WATER AND GAS WORKS BUILDERS.

Water and Gas Works Construction Co., 48 Wood Street, Pittsburg, Pa.
Turner, Clark & Rawson, 50 State Street, Boston.

WATER-WORKS MACHINERY.

Pond Engineering Co., St. Louis, Mo.

WOOD STAINS.

Berry Bros. (Oil Finish), Detroit, Mich.
Samuel Cabot, 70 Kilby Street, Boston.
Walpole Dye and Chemical Works, Boston.
Dexter Bros., 55 Broad Street, Boston.

WOOD-WORK—Interior, Cabinet, etc.

George A. Schastey & Co., 53d Street and Broadway, N. Y.
Springfield Wood-Working Co., 5 East 17th Street, N. Y.

VOLUME FIFTEEN.

(December, 1886—June, 1887.)

This handsome volume is a complete illustrated record of subjects coming within the scope of this journal—Engineering, Architecture, Construction, Sanitation, and related subjects in which municipal problems are a prominent feature. It is a very complete record of weekly events, and also contains a number of special articles of permanent value to all who are interested in the subjects treated.

Among the more notable topics and articles are—

Full-page Architectural Illustrations—

The Memorial Hall of the School at Lawrenceville, N. J., Peabody & Stearns, architects.
Residence at Saratoga, A. Page Brown, architect.
Residence at Narragansett Pier, Douglas Smyth, architect.
A Welsh Shooting-Box and Village, to be submerged on completion of the Vyrnwy Dam.
A residence at Manchester, Mass., Arthur Little, architect.
Commercial Buildings in Philadelphia and Washington, James P. Sims and Hornblower & Marshall, architects.
Views in Old Edinburgh, from the International Exhibition of 1886.
A residence in Philadelphia, T. Roney Williamson, architect.
A Fire-Place in a New York residence, McKim, Mead & White, architects.
A residence in St. Paul, Minn., Gilbert & Taylor, architects.
Depots at Waban and Woodland, Mass., H. H. Richardson, architect.
A hotel in Florida, Frederick B. White, architect.
A house in the English lake region.
Entrance to the Memorial Hall of the School at Lawrenceville, N. J., Peabody & Stearns, architects.
Memorial Bridge to General Grant over the Potomac River, Captain Thomas W. Symons, U. S. Engineers, and Smithmeyer & Pelz, architects.
Home for the Relief of the Destitute Blind in New York City, F. Charles Merry, architect.
A residence in Jamaica Plains, Mass., E. M. Wheelwright, architect.
Stations on the Boston and Albany Railroad, H. H. Richardson, architect.
A residence in Newport, R. I., George B. Post, architect.
Residences in Boston, Rotch & Tilden, architects.
A residence in Cohasset, Mass., W. R. Emerson, architect.
A Commercial Building in New York City, John H. Duncan, architect.
A residence in Beverly, Mass., H. H. Richardson, architect.
A residence in Hackridge, England, R. Creed, architect.
A residence in Newport, R. I., McKim, Mead & White, architects.
A Railway Depot at Mott Haven, N. Y., R. H. Robertson and A. J. Manning, architects.
Church of St. James the Less, Falls of the Schuylkill, Pa.

Also Drawings to Scale of Details of—

An Old Doorway in Boston.
The Pineapple House in Salem.
An Old Colonial Entrance in Charleston, S. C.
A Store Front in New York City.
Doorways of Houses in Fredericksburg and Annapolis, Md.
A Doorway of a Commercial Building in Boston.
Mantels in a Residence in Baltimore.
A Doorway in a Residence in Baltimore.
Details from a House in Dorchester, Mass.
Architectural Iron-Work in Philadelphia.
In addition to the above full-page illustrations there is in each issue at least one Vignette of Buildings of Moderate Cost, selected for architectural merit within a modest limit of expenditure.

Reading matter of special architectural value is—

The discussion by architects of the requirements of preparatory education desirable to fit students of architecture for their profession.
Discussions of the terms of competitions for plans of the Boston Public Library, the Cincinnati City Hall, and other notable buildings.
Cottage Hospital Construction and Management, By Mr. Henry C. Burdett, of London, author of Cottage Hospitals, etc.
Critique of the Exhibition of Architectural Drawings at the Salmagundi Exhibition.
Terms of the competition for plans of the Kansas City, Mo., Building Exchange; a valuable reprint.
There is also much information for architects in the articles on the engineering of building construction and on heating and ventilation, some of which are noticed below.

Engineering—

Among the specially prepared articles, fully illustrated, we notice these:

The series on Builders' and Contractors' Engineering and Plant, which are illustrated articles in detail, of the construction of the Equitable Building and St. Patrick's Cathedral in New York City; of the Raising of the old U. S. Court House in Boston; of the Dredging Scows and Machinery used on several Government Works; of the Hoisting and other Machinery used on the Elevated Railroad of Brooklyn; of the Machinery used in the construction of the Suburban Elevated Railroad, of New York.

Building Construction and Details, describing the practice in the eastern and western parts of the United States and of Europe; of interest both to the engineer and architect.

The Engineering at the Lawrenceville School. Including description in detail, with illustrations of the drainage, sewerage, water-supply, heating and ventilation and plumbing of the work.

Recent Water-Works Construction in the United States. A series of illustrated articles descriptive of works now building or just completed.

The New Croton Aqueduct for New York City is described as it progresses in articles of great value to the engineer.

There are many descriptions, discussions, and notes of interesting water-works undertakings in America and Europe. These are generally illustrated, and, with the reviews of reports of water-works officers, make up a valuable history of current undertakings.

Modern Sewer Construction and Sewage Disposal. A series of papers by Edward S. Philbrick, Mem. Am. Soc. C. E., on the modern theory and practice of sewer work.

Recent Sewer Construction contains a number of illustrated articles descriptive of the most important sewer work, such as that at Newark, N. J., now in progress.

Pavements and Street Railroads is a series of papers on the construction and maintenance of roadways.

In the Natural-Gas Supply of Pittsburg and Vicinity is given a very fully illustrated account of the mechanical means used in applying natural-gas to manufacturing and domestic purposes.

In addition to the serials, there are many articles on General Engineering, Water-Works, Sewerage, Pavements, and other topics of interest to Engineers, Contractors, and Builders.

Domestic Engineering—

This department relates more particularly to topics connected with the welfare of the individual. Under it there are, in this volume, descriptions of the heating by steam and hot water of notable buildings in the United States and Canada, such as the building for the State, War, and Navy Departments at Washington, the High School at Honesdale, Pa., the Post-Office at Woodstock, N. B., and others.

Descriptions of plumbing.
A series of articles on the theory and practice of Hot-Water Heating, by "Thermus."

A discussion of the practicability of heating railway cars by means which will not incur the risk of burning passengers in case of collision, with descriptions of several new systems.

Editorials and notes on the preservation of health, by purity of water-supply, proper sewerage, and similar means.

Reviews of reports of boards of health, and books on sanitary topics.

Contracting Intelligence—

This department is a very complete record, week by week, of projected works in water-supply, sewerage, gas, railroad construction, etc., of great value to the engineer, contractor, builder, and merchant. Returns of projected buildings are also made by special correspondents from all parts of the United States for each issue.

The Proposals give the earliest information of projected works from the Governmental departments, municipal bureaus, and private undertakings.

Bound in cloth, with index, \$3.00. Postage, 40 cents. THE ENGINEERING AND BUILDING RECORD, 82 & 84 Fulton Street, New York. Obtainable at London Office, 92 & 93 Fleet Street, for 15s.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16.
NUMBER 1.

PUBLISHED EVERY SATURDAY.

NEW YORK, JUNE 4, 1887.

LONDON, JUNE 18, 1887.

SINGLE COPIES, TEN CENTS.
Subscription, \$4.00 per year in advance, post paid. IN AMERICA
SINGLE COPIES, SIXPENCE.
Subscription, 20s. per annum in advance, post paid. IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

THEATRE FIRES.

THE destruction by fire of the Theatre Comique, Paris, and the attendant loss of life make timely the publication of statistics of destruction of theatres by fire in 1886, which the *Gesundheits-Ingenieur* quotes from the *Deutsche Bauzeitung*. "The Fire Commissioner, G. Gilardone, in Hagenau, writes, that the theatre fires of the past year are again less numerous than in the preceding year, since they amount to only six, if one case occurring in the last days of the year 1885 is included, as is necessary for comparison with corresponding records.

1. On December 7, 1885, the auditorium of the German Theatre at Moscow burned down; stage, boxes, and some rooms besides were preserved.

2. January 2, 1886. Complete destruction of White's Theatre in Detroit, Michigan.

3. March 12, 1886. Burning of the city theatre (Stadttheater) in Lemberg, which, however, was confined to the stage.

4. May, 5, 1886. Complete destruction of the Theatre in Derby, England, after the same had been opened only about six weeks.

5. July 29, 1886. Complete destruction of the theatre in Tinnervally, British India—probably only a very light wooden building.

6. Complete destruction of the "Teatro dei Filodrammatici" in Ravenna, originating in a private lodging located in the building. Here also the structure was a light one. The day and hour of the accident are not precisely stated. Two more cases—one in Spain, one in Algiers, only indefinitely reported—are apparently of such unimportance that they may remain out of consideration. Interest is attached to accidents Nos. 1 and 4, since they give evidence of the very remarkable danger under which new theatres stand.

The accident No. 3 is interesting, since they succeeded in confining to its place of beginning a fire originating in a very dangerous locality.

Gilardone's statistics show finally the interesting fact of the continual decrease in the number of theatre fires since the year of the Vienna Ringtheater fire. Since then the following have occurred: 1882, 25 theatre fires; 1883, 22; 1884, 10; 1885, 8; 1886, 6.

It is unimportant if these figures be quite exact or not; they give, nevertheless, a striking proof of the significant influence exercised by the special protective measures universally adopted since 1881."

Engineering, in a recent editorial, thus refers to the American Exhibition now open in London:

The grounds are more extensive and should be more beautiful than at South Kensington, and though the switch-back railroad and the toboggan-slide suggest a more demonstrative spirit of amusement than would suit the tone of many of the patrons of the Fisheries and its successors, they will probably draw many thousands who will like the place all the better for these entertainments. But there is no doubt that exhibition, grounds, switch-back railroad, toboggan-slide, and all the other attractions are but side-shows to the great Wild-West entertainment. By no possible stretch of ingenuity can this feature be brought within the scope of criticism in *Engineering*. None the less, however, did a crowd of prominent members of the profession, to say nothing of those eminent in almost every other path of art, science, and industry, en-

thusiastically follow the prolonged performance that for the first time was given to a British audience on Monday last. The grand stand which dominates the arena is large enough to hold nearly 20,000 persons, and of itself is a wonderful spectacle when crowded on every tier and from end to end of its vast sweep.

We believe that the exhibition is practically an American enterprise—we mean that most of the heavy capital required has been furnished from the United States—and we trust that those most deeply interested in the welfare of the undertaking will not be wanting in firm and judicious management—a condition as important as an attractive show. There is little doubt, we think, that if the exhibition is a success, it will tend largely to increase pleasant and familiar relations between this country and America, while if it should not succeed an opposite result will unfortunately be effected. The public are certainly ready to do their part to bring about the former and much-to-be-wished-for conclusion. It depends, therefore, almost wholly upon the executive.

We have no exact knowledge on the subject, yet we venture to state our belief that the only American capital invested is that in Buffalo Bill's Wild-West Show enterprise. What connection that has with the American Exhibition corporation of course we do not know. While we, like our English contemporary, wish success to the exhibition, we cannot, like it, entertain the feeling that its failure would in any way interfere with "pleasant and familiar relations between England and America." We do not believe the failure or success of that particular exhibition would have the slightest effect on the feelings Americans have toward England and Englishmen, since on this side of the water this exhibition is not regarded as an American enterprise.

STANDARD PIPE-THREADS.

In noticing the adoption of a standard thread for wrought-iron pipe and fittings by manufacturers in the United States, *Engineering* compliments the American Society of Mechanical Engineers, through whose agency this important movement was successfully accomplished. It asks, "When will any of our engineering societies do the like for us?" and suggests that an attempt be made, and "if a standard were put forth by a committee of the two leading engineering institutions and the Board of Trade, and were so framed that it did not hurt the susceptibilities of any leading firm, there seems no reason, other than British obstinacy, why it should not be adopted."

In our opinion, if this obstinacy prevails and British manufacturers refuse to adopt a standard thread, that circumstance will help the export trade of the United States in pipe and fittings, since purchasers in other countries will prefer to be spared the annoyances inseparable from mixed threads, and, consequently, prefer American goods.

CINCINNATI seems to be a locality where an architect's services are not highly valued by building committees. We recently had occasion to criticise the building commissioners of the new City Hall for their method of instituting a competition, and now we notice that trustees for the erection of a \$100,000 armory advertise for plans for a building to accommodate twelve companies of infantry and a battery of artillery, in which they simply ask for "plans, drawings, and specifications." They offer absolutely nothing to

those whom they invite to send in plans, and they allow only four weeks' time for the preparation of what they appear to want. Our recent remarks about the City Hall competition would seem to apply equally well to the men in charge of this one, though the wording of their advertisement would seem to indicate that they are even more ignorant than the members of the other committee.

RESULT OF CINCINNATI ARCHITECTURAL COMPETITIONS.

A GENTLEMAN in Cincinnati writes us:

"The result of such architectural competitions in this city as you have so severely criticised may be illustrated by the following editorial in a recent number of the *Times-Star*:

"The plans for additional buildings for the Centennial Exposition are now being exhibited at the Chamber of Commerce, and to say that they are disappointing is putting it mildly. The majority of them are absolutely destitute of new ideas. One architect has imitated a series of circustents in his design for a main building with admirable suc-

usual exhibition rule, the majority of the exhibits were conspicuous by their absence. It was unfortunate, also, that, owing to an accident to the steam-main on the morning previous, the machinery in the Motion Department could not be started, and still further unfortunate that the electric-light installation was not complete, and that the building was, therefore, in darkness during the evening, although the electric lamps in the grounds were lighted about 9 o'clock. The result of these drawbacks was to throw the "Buffalo Bill Wild-West Show" into greater prominence, as this department was absolutely ready and complete, making the exhibition really second and a side show to Buffalo Bill, which, to say the least, is to be regretted. When the exhibits are in place they bid fair to be of interest.

Certain experiments of a new method of ventilation, known as the "D. C. Green Ventilating System," have just been held at 91 Queen Victoria Street, London. The principle is, the discharge of compressed air, depending upon the induced current for efficiency. A compressor supplies the air at a pressure of three to five pounds to the

and eight torpedo tubes. Her heaviest shot would be 1,800 pounds, and the total weight of the broadside 4,760 pounds.

Dr. W. Collingridge, the Medical Officer of Health, Port of London, states in his report for the latter half of the year 1886, to the Port Sanitary Committee, that during the six months 11,064 vessels of all classes were inspected by the officers of the authority, of which 798 were found to require cleansing in some form or other, being a proportion of 7.2 per cent.

SAFETY-VALVE.

OUR SPECIAL ILLUSTRATION.

WASTE-WEIR OUTLET OF THE KANGRA TANK,
AHMEDABAD, INDIA.

THE subject of our special illustration is the outlet of a waste-weir or overflow sluice of one of the large tanks or reservoirs at Ahmedabad, India. Our drawing is made from a photograph procured in London. Fergusson, in his history of *Indian Architecture*, says: "Among the objects of architectural beauty are the inflow and outflow sluices of the great tanks which abound everywhere around the city. Nowhere did the inhabitants of Ahmedabad show

RESIDENCE OF I. W. BIRDSEYE, BRIDGEPORT, CONN.—J. W. NORTHROP, ARCHITECT.

cess; but, after all, that was not what was wanted. The other architects appear to have made a hash of the modern skating-rink, the Centennial Buildings at Philadelphia, with here and there a dome or a bit from the London Crystal Palace thrown in. Then, half of the plans are merely for effect on paper, being utterly impractical when it comes to putting them in wood and iron.

"This same paper also has called attention to the superior methods of Norcross Brothers, of Boston, in erecting the new Chamber of Commerce. They built a board fence and walk around the lot and erected derricks inside. It is the custom here for builders to use the streets, making pedestrians take to the mud."

OUR BRITISH CORRESPONDENCE.

The American Exhibition Opening—The Green Ventilating System—War-Ship "Victoria"—Inspection of Vessels by London Port Authorities.

LONDON, May 18, 1887.

THE American Exhibition at Brompton was duly opened on Monday, 7th inst., by Colonel Russell. Following the

square inch, through pipes terminating in a special nozzle, discharging thence into a larger tube or shaft acting as a conduit, said tube or shaft being supplied with fresh air independent of that from the special nozzle. The apparatus can be utilized for either extraction or supply. The pipes leading to nozzles are merely ordinary gas-pipes, 1-inch to 1 1/4-inch, and so can readily be led to any required situation in the building. The prominent objection to the system is the noise due to the discharge of the compressed air, but this is held to be of very little consequence in a large building.

Probably the most powerful war ship afloat is the "Victoria," just launched from the yard of Messrs. Armstrong, Mitchell & Co. Her length is 340 feet, breadth 70 feet, mean draught 26 feet 9 inches, and displacement 10,500 tons. Her engines are 12,000 horse-power, and she will steam 17 knots. Her armament is, two guns of 110 tons each, firing ahead, one 30-ton astern, and armored side-batteries of twelve 5-ton guns and twelve 6-pounders, and nine 3-pounders, the latter quick-firing guns. In addition to this, she has a complement of machine guns, rams,

how essentially they were an architectural people as in these utilitarian works. It was a necessity of their nature that every object should be made ornamental, and their success was as great in these as in their mosques or palaces."

OUR VIGNETTE ILLUSTRATION.

RESIDENCE IN THE SUBURBS OF BRIDGEPORT, CONN.—
JOSEPH W. NORTHROP, ARCHITECT.

THE subject of our vignette illustration this week is the residence of Mr. Isaac W. Birdseye, in the suburbs of Bridgeport, Conn. The first story is of Philadelphia brick, trimmed with light granite. The exterior of the second story is frame, shingled, gables rough cast, and the roof is slated. The interior finishings are in the natural wood, parlor and library in cherry, hall and dining-room in oak. The floors of the vestibule, halls, and conservatory are tiled. The hall and dining-room have paneled wainscots and paneled ceilings. There is plate-glass in windows and stained glass in the dining-room. Mr. Joseph W. Northrop, of Bridgeport, was the architect.

OUR SHEET OF DETAILS.

OUR detail sheet, the eleventh in the series, shows a mantel in the house of Dr. Johnson, at Germantown, Pa. The house was built in 1798.

THE SANITARY ENGINEER & CONSTRUCTION RECORD ILLUSTRATED SERIES.

WASTE WEIR OUTLET OF KANGRA TANK,

AHMEDABAD, INDIA.

BUILDERS' AND CONTRACTORS' ENGINEERING AND PLANT.

No. XVIII.

(Continued from page 572, Vol. XV.)

We illustrate in Figs. 68 and 69 the traveling derrick for the erection of the iron-work of the Kings County Elevated Railway.

This is a frame-work of timber, supporting three derricks and a working platform. The lower supports are far enough apart to span the double street-car tracks on the surface. The whole structure rests on four wheels 16 inches diameter, which travel in iron channels attached to 6x12-inch wooden sleepers. The machine constantly *retreats* from the finished work. The shoes to the masts are cast in one piece with the cheeks for supporting the mast; the details are shown in Fig. 70. It will be seen that the line of thrust from the booms is almost directly in line with the point of support, and the tendency to rotation of the short supporting timbers is greatly diminished from that in the derricks shown on page 571. The fall is differently led also.

The hoisting-engine, Fig. 71, was manufactured by Messrs. Copeland & Bacon, of New York, and is styled by them a "4-inch reversible engine for bridge-building." It is a trunk-engine, with cylinders $8\frac{1}{2} \times 9$ inches, and provided with a link-motion for working the valves.

The gear is central, consisting of a driving-pinion with 11 teeth, gearing into a wheel with 38 teeth on the first shaft, and that into 56. The shafts run entirely through, and the capstan-heads turn freely on them, being held in place by the cap or washer, and nut as seen. The clutches work on feathers, and any one or all the winches may be engaged as desired. The engine is very compact, and is well and strongly built.

The work of putting in the foundation is progressing rapidly, and the erection of the superstructure is now under way.

This machine is manifestly less easily handled than one which travels directly upon the finished work; but

the design of the superstructure, if we are rightly informed, does not admit of this method.

The iron-work is under contract with the Phoenix Bridge and Iron Company. The chief and locating engineer is Mr. C. E. Cook and the foreman of erection, Mr. W. D. McKee.

THE SWEETWATER DAM AND IRRIGATION EXPERIENCE IN SOUTHERN CALIFORNIA.

We are indebted to Mr. James D. Schuyler, Chief Engineer of the Sweetwater Dam, now in process of construction at San Diego, Cal., for the following particulars regarding it:

•HOISTING MACHINE•USED IN ERECTING•KINGS COUNTY•ELE•RY•
N.Y.

The dam in process of construction by the San Diego Land and Town Company is designed for the purpose of storing the winter flow of the Sweetwater River for use during the spring, summer, and fall for the irrigation of the wide belt of fertile Mesa lands adjoining San Diego on the south and extending for some eight miles along the shores of San Diego Bay, as well as for the domestic supply of the rapidly growing town of National City. The Sweetwater River has a water-shed of about 200 square miles, of which about 180 square miles lie above the point where the dam is located, some seven miles above its mouth. It heads in the Cuyamaca Mountains to the east, near the rim of the Great Colorado Desert, at an altitude of 5,000 to 6,000 feet, and is some fifty miles in length. Its watershed is, therefore, quite narrow, and generally precipitous in its upper course. The rainfall along the coast ranges from one to twenty-five inches annually, but is generally less than eight inches. In the mountains it is often as high as fifty inches, besides a snowfall of several feet. The snow melts rapidly and does not prolong the flow of the stream into the summer months as is the case in the Sierra Nevada of Northern California. Consequently the stream is subject to sudden floods after each rainstorm, which expend their force in a few weeks, and the flow of the stream dwindles in summer to less than one cubic foot per second. As a source of irrigation supply it was, therefore, unreliable without establishing means for storing the winter flow. The site selected for the dam is an admirable one. A low range of hills formed by some eruptive dike here crosses the course of the stream, and the narrow cañon worn through them, less than half a mile in length, affords the opportunity for converting the large valley above the cañon into a great artificial lake. It was one of the rare places formed by nature with every suggestion to man to avail himself of the opportunity. The best of materials were at hand, and we were given a choice, as there are unlimited beds of the finest clay immediately above the dam, and a cliff 150 feet high of the choicest rock ever made for dam purposes but 600 feet below. An earthen dam was at first contemplated, but owing to the narrowness of the cañon (only 280 feet at a height of 60 feet) a masonry structure was decided upon as the cheaper and more stable. Work was begun December 1, 1886, and the dam has now reached a height of sixty feet over a considerable part of its length, and will be completed to that height by June 1, 1887. When finished to that height we shall begin at the base with a new backing, with the view of carrying the structure to a height of ninety feet. The cross-section of the 60-foot dam is shown below in sketch. I have not yet fully decided upon the lines for the higher structures, but they will be nearly as shown by the dotted lines.

The dam is built on a true curve of 222.3 feet radius, and at its ultimate height of 90 feet will have a spring

(middle ordinate) of 35 feet and an extreme length of 360 feet. Its length at the level of the outlet-pipe is 140 feet. at the height of 40 feet it is 230 feet long; at 60 feet height 280 feet long, while it carries its maximum height for only the distance of 40 feet.

The bottom was exceedingly irregular and rough, like a succession of cones of all sizes and shapes.

The excavation for the foundation was comparatively easy in the creek channel, as the water had polished the bed-rock and it was only necessary to dig out the crevices. At the sides all the loose and soft rock was stripped away and the wall well bonded into the solid ledge. The masonry is of the best character, of rough rubble, laid in blocks as large as can be handled with derricks, in mortar made of one part of Portland cement to two of sand for the four feet next the face, and one of cement to three of sand in the body of the wall. It is mixed as thin as can be handled conveniently without flowing out of the joints and thoroughly tamped. Since the dry weather has set in I keep a man at night throwing water over the masonry in order that the mortar shall not dry out before it has thoroughly set. The stone is a metamorphosed siliceous rock,

containing hornblende, iron pyrites and magnetic iron in large proportion. The weight is, therefore, greater than granite. Various tests made show its specific gravity to be 2.8 to 3.2, or 175 to 200 pounds per cubic foot. This unusual weight brings up the average weight of the masonry to over 160 pounds per cubic foot, and accounts to some extent for the rather slender dimensions that have been adopted. The wall is theoretically stable without reliance upon its arched form, and the transmission of its strains to its abutments.

The reservoir formed by the wall covers 275 acres at the 60-foot height, and has a capacity of 1,250 million gallons, of which 91 per cent. is carried in the upper 20 feet of height. At its ultimate height of 90 feet it will contain 6,000 million gallons, and cover 700 acres. The latter volume is sufficient to irrigate 20,000 acres of land and supply a city of 10,000 inhabitants, if it were filled but once in two years. In other words, the reservoir provides for the contingency of a rainless year by carrying two years' supply. The class of irrigation to be carried out will be of the highest and most costly type, which has formed its fullest development in Southern California. The water will be conveyed under pressure in pipes to each tract of land, and will be sold in volume as used. It is designed that each irrigator shall have a small concrete or cement-lined reservoir on the highest point of his land, and will have it filled periodically from the mains, paying for it by the reservoirful.

Experience has demonstrated that the Mesa lands of San Diego County require a less volume of water in irrigation than any other soils of the State, but the little they do need they need very badly. The average volume required on large areas, and on all classes of cultivations, is estimated at one miner's inch of continuous flow for each 30 acres. A miner's inch will flow 1,728 cubic feet in twenty-four hours, hence the quantity allowed for as sufficient will cover the whole surface about 6 inches deep in one year, or be equivalent to a rainfall of 6 inches. A much greater quantity than this is found to be not only un-

necessary, but positively deleterious, affecting the quality and flavor of the fruit. An exception to this rule is the orange, which demands water incessantly in small, but constant, supply. In California generally more injury is done by excessive irrigation than by the lack of it, and the most perfect and satisfactory results have been obtained in the southern part of the State, where the scarcity of water has compelled the utmost economy in its use.

Cost.—The cost of the dam at the elevation of 60 feet will be \$90,000, and when carried to completion, \$160,000. The distributing system and mains will cost about \$500,000. The average cost per acre will not be far from \$50. The lands thus supplied sell readily in small tracts for \$300 to \$500 per acre.

The cost per cubic yard of masonry in the wall ranges from \$9 to \$12. I take at random from my memorandum-book the average of a week's work per cubic yard of masonry laid as follows:

Quarrying rock.....	\$0.34.7 per cubic yard.
Handling and loading rock.....	0.34.6 " "
Hauling.....	0.62.5 " "
Sand.....	0.36.0 " "
Cement.....	4.46.0 " "
Masons.....	0.84.0 " "
Hod-carriers.....	0.27.2 " "
Mortar-mixers.....	0.16.7 " "
Derrick-work.....	0.41.9 " "
Foremen.....	0.28.8 " "
General labor.....	0.47.0 " "
Blacksmithing.....	0.06.8 " "
Total.....	\$8.66.2

Masons are paid \$5 per day; hod-carriers, \$2.50; common labor, \$2 to \$2.25; foremen, \$6.

The stone is loaded with a simple shear by derrick at the quarry upon wagons, and hoisted upon the wall with horse-power derricks. The heaviest stones, two tons and over, are hoisted at the rate of 60 feet per minute, clear lift.

The disposal of the waste-water and the method of controlling the admission of the water to the pipes is thus dealt with. The latter is performed by means of a hexagonal tower of stone masonry, in which are set at intervals of 10 feet elevation cast-iron elbows, with bell-mouths, outside the tower. A simple cast-iron valve sets on each bell-mouth, with a wire-rope attached running over a sheave in the house on top, with a counter-weight passing down inside the tower. The valve is hoisted and replaced with a basket-screen when water is to be admitted to the tower. The great number of inlets into the tower afforded by this method allows of drawing water from any level de-

sired. When the gate in the pipe below the dam is closed all pressure is relieved from the valves so that they are easily hoisted.

The waste-water is to be utilized to furnish power to pump a portion of itself to an auxiliary reservoir 150 feet higher than the main reservoir. A fall of 100 feet can be obtained, and Pelton hurdy-gurdy wheels will be used to convert the power into useful work. The water used for irrigation on the lowest levels will also be used to supply power through the same wheels, to keep up the pumping during the summer.

The main wasteway for flood-waters will be through a gap in the side of the reservoir 2,000 feet above the dam. This gap will be just reached by the 90-foot contour.

The main pipe will be 30 inches diameter, 5 miles long, and the distributing-pipes, to be laid this year, will have an aggregate length of about 40 miles.

RAPID RAILWAY BUILDING.

The Manitoba Company Pushing Westward at the Rate of Five Miles a Day—Six Thousand Six Hundred Men and 3,000 Teams at Work—How They Are Fed.

WHITE EARTH RIVER, MOUNTRAILLE COUNTY, DAK.

A CORRESPONDENT of the St. Paul *Pioneer Press* thus describes some rapid railway construction:

"Just beyond this point and eighty miles west of Minot, the traveler finds himself at what railroad men call 'the front,' or the end of the track of the extension which the Manitoba Railway Company is now making to Great Falls, Mont. To speak more accurately, this was the end of the track yesterday, but to-night that point will be five miles further westward, and by to-morrow yet five miles further. From Minot here the work has been in progress since the first week in April. From now on it is proposed to complete five miles of track each day, thus achieving the greatest feat ever attempted in the way of rapid railway construction. From here to Fort Buford the distance is a little over sixty miles, and it is the intention to have the road open to that point by June 1. Thence to Great Falls the distance is 403 miles, and trains will in all probability be running to that point before the middle of September.

"It can readily be surmised that the accomplishment of this gigantic enterprise requires little less than an army of workers, and that is what one finds here. The number of men now at work is 6,600, and the number of teams, 3,000. With this force it is hardly to be wondered that the dirt is flying at a lively rate. From here to seventy miles beyond Fort Buford there is one unbroken series of graders' camps. Fifty of these camps can be seen from one point some distance beyond White Earth. By June 1, between 3,000,000 and 4,000,000 cubic yards of earth will have been taken out, and by the time Great Falls is reached the amount will aggregate not far from 10,000,000. On the Canadian Pacific, during the whole of last summer, the amount of earth handled was only 6,700,000 cubic yards, and this was considered a remarkable piece of work. A few figures may serve to give a clearer conception of what is involved in the construction of five miles of railway track in one day. A rail is 30 feet long, and there are consequently 352 to the mile, or 1,760 to every five miles. As each rail weighs 600 pounds, the amount of steel handled in one day aggregates 1,056,000 pounds. It takes 2,640 ties to the mile, or 13,200 per day. Thirty-six 200-pound kegs of spikes are used to the mile. There are 32 'spikers' to every five miles of track, each man of whom drives 840 spikes a day, which, at the average of three blows to the spike, gives 2,520 blows per man per day. A mile of rails takes 1,408 bolts, which are handled by fourteen 'bolters,' or 503 each per day. To avoid delays in the progress of construction by reason of rough country, it is the intention of the contractors to work five gangs of men in five-hour reliefs during a portion of the time. Work will begin at 3 o'clock in the morning, and the darkness will be scattered by thousands of torches.

"With such an army of men and teams at work far from the centres of civilization, and in a totally unproductive country, it can be readily seen that the task of securing and distributing supplies is one of enormous magnitude. Indeed, there is little doubt that greater executive ability is required in this than in almost any other department of railway construction in the far West. Here at White Earth is, for the present, the headquarters of the supply train, consisting to-day of twenty cars filled with every conceivable thing necessary for man and beast. There is grain, flour, canned goods of all sorts, butter, hams, sugar, wagons, harness, plows, boots and shoes, pipes and tobacco—in fact, nothing is lacking. Every day sees a big hole made in the stock, and every day sees the hole replenished by incoming trains. Day before yesterday 15,000 bushels of oats were sent out by wagon and yesterday 5,000 bushels, all for distribution along the line for a distance of forty miles. From here on the trail along the line is marked by one continuous stream of freighters' teams distributing supplies to the various camps. The other day a herd of 170 head of cattle was driven in and it seemed that there at least was enough meat for some time to come. A rapid calculation, however, showed that it would furnish only

about ten pounds to the man. Already 250,000 pounds of flour and 500,000 bushels of oats have been purchased. Lovers of baked beans will learn with alarm that the supply of that luxury is about exhausted. A letter just received from one of the largest wholesale firms of St. Paul states that if the demand is to continue throughout the summer as large as it now is, it will be necessary to import from Europe. They say they have now secured all the beans that can be found in the United States, and that they have only enough to last this army here for two months.

"Another interesting feature of this train is the hospital cars, where the laborers suffering from disease or accident are cared for by a regular physician, assisted by several nurses, the expenses being met by a contribution of two cents a day from each laborer employed."

NEW ENGLAND WATER-WORKS ASSOCIATION.

THE New England Water-Works Association will hold its sixth annual convention at Manchester, N. H., June 15, 16, and 17, 1887. The headquarters of the association will be at the Hotel Windsor. Those intending to be present are requested to communicate with Mr. Charles K. Walker, Superintendent, Manchester, N. H., in regard to hotel accommodations.

Hotel rates will be \$4, including the dinner of Wednesday, and the breakfast on Friday morning. Rates for a single day, \$2.

THE LOUISIANA ASSOCIATION OF ARCHITECTS.

AN Association of Architects of the State of Louisiana has recently been formed at New Orleans. Thomas Sully is President; William Fitzner, Vice-President; W. C. Williams, Secretary and Treasurer; and Messrs. S. M. Patton, A. Toledano, B. M. Harrod, J. A. Braun, and C. A. Leffingwell are the charter members. Mr. Sully, who was a member of a Committee of the Western Association of Architects whose duty it was to promote the formation of State associations, has been active in bringing about the formation of this society.

REGARDING THE STUDY OF ARCHITECTURE.

MR. GEORGE SNELL, of Boston, in reply to Professor Osborne's query on page 604, issue of May 7, writes:

"In answer to the questions of Professor C. Francis Osborne, I would say, algebraic trigonometry and conic sections will be of little or no use to the architect; he should know enough of the algebraic mode of calculation to be able to solve simple equations and to use symbolic formulas instead of rules. If, however, he aspires to design any original construction, he should advance in the direction of the binomial theorem and the differential and integral calculus sufficiently to understand the calculations which determine the comparative strength of the various shapes of girders and other portions of a construction."

Mr. Leopold Eidlitz, of New York, writes:

"In answer to Professor Osborne's inquiry (THE SANITARY ENGINEER AND CONSTRUCTION RECORD, May 7), whether a thorough training in (1) geometry and conic sections, (2) algebra, and (3) trigonometry give the architectural student all the purely mathematical knowledge that is necessary, I should say that the architect who intends to master modern iron construction and the theory of arches should be able to read text-books like Weisbach, Rankin, and Culmann (Die Graphische Statik. Zurich: Mayer & Zeller. 1875), with ease. To do this requires a knowledge of analytical geometry and the calculus."

W. W. Goodrich, architect, of Oakland, Cal., Instructor of Architecture at Oakland Institute, writes:

"Professor Osborne's questions, May 7, 1887, page 604 of your excellent journal, are very timely. I insist in my classes, as per my curriculum as per enclosed catalogue, which see—geometry, algebra, and trigonometry." He also thinks "an architect should also serve at least two years as a carpenter and stair-builder. This will give him a practical insight of the construction—not in a city shop, but a country shop, of say a place of several thousand people. There he will get all of the various ideas that go into the construction of a frame or brick building, etc."

RAILROAD BALLAST AND ITS MECHANICAL EXTRACTION.

IN a recent article in *Le Genie Civil* Mr. Jules Michel, Chief Engineer P. L. M. R.R. of France, is quoted as saying his engineers have found in the last fifteen years that when the ballast on the road has lost its permeable quality it must be worked over and brought back to that condition. In opening up pits along the railroad they found so much

sand with the ballast that the cost of screening would more than pay for extra harsh and mechanical screening at some central pit. At first excavators were used and the materials screened. This process was slow and not satisfactory.

In 1885 Messrs. Martin Bros. & James added a pump to the excavator and delivered the material over a horizontal screen where a heavy stream of water carried the fine material back into the pit; a second screen separated the $\frac{1}{4}$ -inch ballast from the larger stones. The cost delivered was about 58 cents per cubic yard.

Lately Messrs. Delamare & Panty having a contract to furnish the P. L. M. R.R. with eighty thousand cubic meters of ballast, they set up a special plant at their pit. It consisted of a Universal Excavator, with a 25-horse-power engine, and also an elevator to raise the prepared ballast to a dump at a height of 23 feet.

The excavator has 16 buckets of $2\frac{1}{2}$ cubic feet capacity each; five are on endless chain, the drums being set in a frame to work from the side either above or below the road-bed. A pair of elliptical springs at the top of the chain allow a certain play in case a large rock or boulder is struck, thus allowing the buckets to pass over it. The platform is pivoted on the truck, so as to allow a revolution of some 60 degrees in a horizontal plane.

As the gravel is brought up by the excavator it is delivered into an inclined rotary screen. This screen is $3\frac{1}{2}$ feet in diameter, 7 feet long, and formed of $\frac{3}{8}$ -inch steel rods set $\frac{3}{4}$ of an inch apart. The inclination is adjustable according to the material. The speed of the screen is 30 revolutions per minute, and by means of a cam four hammers are raised and let fall, giving 50 blows per minute on top of the screen, thus preventing all clogging of the screening. The screen is geared from the engine. It can be removed in a short time and replaced by an ordinary chute for common excavating purposes or for loading the cleansed ballast into cars when needed. The screenings fall into open cars and are carried off to make the road-bed for the excavator.

The ballast falls into an iron box from which it is raised by the elevator which is on an adjoining track and run by a 7-horse-power engine. The track for cars of screenings is between those of the excavator and those of the elevator. The elevator has 27 buckets and can deliver to the height of 22 feet 21 buckets per minute. At this pit there was 35 per cent. screenings; in a day of 12 hours, 4 hours are spent in shifting cars, tracks, etc. Amount of ballast prepared and piled up per day 400 cubic yards, of which the cost was $10\frac{1}{2}$ cents, the cost by hand cleaning and excavation being 24 cents. The cost of the plant was \$26,500.

INTERNATIONAL EXPOSITION OF RAILWAY APPLIANCES AND INDUSTRIES, PARIS, 1887.

CHICAGO, ILL., May 23, 1887.

SIR: I am requested by the Executive Committee in France to ask the favor of appealing through your columns for the loan of any objects, books, medals, drawings, etc., relating to the history of railways and means of transportation generally, both ancient and modern, in this country.

I am directed also to say that all expenses of forwarding and returning the same to the lenders, packing and unpacking, will be defrayed by the Executive, and insured for the value the lender may put upon each object, and that special attendants will be told off for their safe custody.

All communications on the subject may be addressed to M. G. Senechal, 8 Faubourg Montmartre, Paris, or to Mr. George L. Fowler, M. E. (of New York City), Commissioner in charge for the United States, Palais de l'Exposition, Bois de Vincennes, Paris, France. By addressing communications direct to Paris, much valuable time will be saved.

Hoping you will kindly insert the above, and accept the thanks of the Executive Committee, I am

Yours truly, JOHN W. WESTON,
Commissioner-General for the United States.

NATIONAL CONVENTION OF WATER-WORKS SUPERINTENDENTS.

A MEETING of the City Council Committee on Water-Works, of Minneapolis, and the Special Committee recently appointed on the National Convention of Water-Works Superintendents, has been held, the joint committee uniting in a recommendation that the city should take full charge of the reception and the entertainment of the guests. The proposed programme was discussed fully. The convention will be held in that city July 13-15 inclusive.

HOT-WATER HEATING AND FITTING.

BY "THERMUS."

No. V.

(Continued from page 633, Vol. XV.)

TO FIND THE FLOW OF WATER IN PIPES.

HOW TO calculate or find the rapidity of motion in the mass of water, or its velocity through the pipes of an apparatus, we will now consider. Let us take a tube, say twelve feet long, as shown in Fig. 12, and fill it with water at 40° Fah.—and what would ordinarily be called cold water—until it just reaches the 10-foot level at *a*; or, in other words, we have a column of water just ten feet high at mean temperature within the tube. If we now apply heat to the bottom of the tube and expand the water until it boils, or until the whole mass of water is warmed to 212° Fah., we will find that the column that was just ten feet

Fig. 12

Fig. 13

high when it had a temperature of 40° Fah. is now 10' 4 $\frac{1}{2}$ " high, or at *b* in the tube, having increased just .04 of its length (Dalton) by being warmed from 40° to 212° Fah.

If we now take two such tubes arranged side by side as in Fig. 13, and connect them at the bottom with a cross-tube and closed cock, arranging an overflow-pipe in B at the 10-foot level *c* and filling it (B) with water until it was on the point of flowing out, while at the same time we fill the pipe A with water to the 10' 4 $\frac{1}{2}$ " level (*b*), we will find on suddenly opening the cock the water will fall from *b* to *a*, overflowing at *c*, and that if we carefully measure its velocity at the start we will find it to be just 5.06 feet per second of time, or 303 feet per minute—exactly the velocity a piece of lead would obtain as it reached *a* if it fell from *b* to *a*, a distance of 4 $\frac{1}{2}$ inches:

If we now run water in at the pipe *d* (Fig. 13) so as to maintain a head of water in A equal to the height *a b*, the water will flow through the pipe A to the cross-pipe, through that pipe to B, and overflow at *c*, with a lineal velocity of a little over five feet per second, assuming the pipes are of equal diameter throughout, friction not considered. In other words, this will be the greatest theoretical velocity possible in the pipes of an apparatus for a ten-foot column, under the greatest ranges of temperature and density due to the pressure of one atmosphere.

Now, if our column is twenty (20) feet high the expansion of the water will be just double for the same range of temperature, and the fall will be 9 $\frac{1}{8}$ inches, but the velocity is not doubled by any means, and it will be found to be only 7 $\frac{1}{8}$ feet per second, as I will endeavor to show.

The fall of water in pipes follows the same law as the fall of a weight through a vacuum. Where a weight falls through the air it meets some resistance, and when water falls in a pipe it meets resistance by friction, etc., but we will not consider it here.

The simplest formula to express the law which governs the velocity of a body falling by terrestrial gravitation is

$$V = \sqrt{H} \times 8,$$

in which *H* = the height fallen from or the distance fallen through in feet, and *V* = the velocity in feet per second.

If we therefore apply this rule to a body falling 9 $\frac{1}{8}$ inches—in other words, .8 of a foot—we will find the velocity to be 7 $\frac{1}{8}$ feet per second, or 429 feet per minute, and the same is true of the water falling from the same height.

It will be noticed, therefore, that though the distance through which the water had to fall was doubled the velocity was not increased *one-half*, for the simple reason that the velocity increases only as to the square root of the height from which the water falls.

If we go on, therefore, and see what the velocity will be for a 100-foot column (which is ten times the height of the first column), the ranges of temperature remaining the same (40° to 212°) and the distance fallen from four feet, we will find by applying the rule it will be square root 4 = 2 × 8 = 16 feet per second, or 960 feet per minute, which is very little over three times the speed it would attain when falling from only one-tenth of the height.

The velocity last mentioned, however, will never be attained in the pipes of an ordinary heating-apparatus, as there cannot be in ordinary practice anything like 170° Fah. between the temperatures of the flow and return-pipes, even should there be a building 100 feet high warmed with hot water, and it is therefore simply instanced here to fix in the mind of the fitter that the increase of velocity of flow is small compared to the increase of height of the apparatus, and that comparatively shallow or low apparatus with an apparently small difference between the temperatures of the water in flow and return pipes will be found to have a velocity of flow surprisingly good, if the pipes are only sufficient in diameter not to retain its flow and properly placed and fitted.

(TO BE CONTINUED.)

DIRECT-INDIRECT VERSUS INDIRECT HEATING FOR LARGE BUILDING.

EARLHAM COLLEGE, RICHMOND, IND., May 14, 1887.

SIR: Will you please be kind enough to inform me on the following subject: Is not the "direct-indirect" system of heating much better for large college and public buildings than the "indirect," and will it not obtain as good if not better results in the way of ventilation? I mean the "direct-indirect" system as given by Baldwin on page 30 of his valuable book, "Steam-Heating."

My reason for asking is that the above college is now erecting two new college buildings, and the architect recommends the indirect system, with radiator coils in the cellar. The buildings will be entirely exposed, and often the thermometer is as low as 26° below zero. One building is 56' 4" x 35' 6" and two stories high; the other is in its extreme dimensions 174' 4" x 156' 4" and three stories high. If you would like to see plans I can send them to you in a week or so. Should not the warm-air registers in case of the "indirect" system and the radiators in case of the "direct-indirect" system be *always* placed immediately under the windows with the vent registers on the opposite side of the room at the floor?

An early answer will greatly oblige a subscriber and constant reader of your paper. EARLHAM.

P. S.—Our old plant is "direct" and we are going to do all of the heating from the one boiler-house and the same set of boilers.

[The system of warming and ventilating known as the "direct-indirect" system, in which the radiators are under the windows with the fresh air taken to them through air-passages under the sills leading to box-bases, should never be depended upon for ventilating school-rooms. Baldwin describes this system in his book as one of the usual methods of warming with which ventilation or the admission of air is combined; but he does not place it ahead of "indirect" heating as a means of ventilation, nor should it be so considered, all other things being equal for one moment.

With "direct-indirect" radiation enough air may pass through the inlets to supply air for two or three persons in a room, and, therefore, it may do for office-rooms or residences, provided it is properly done; but for schools or crowded academic rooms or auditoriums it is wholly inadequate.

Take, for instance, an inlet 4x12 (an average size for such work) or the third of a square foot, and assume it is passing air at five feet per second—an unusually high velocity for such work—6,000 cubic feet of air per hour is all that possibly pass through it; and even if you have the inlets to six rooms, 18,000 cubic feet, or sufficient

or twelve persons, is all that can pass. But in ordinary practice a velocity of five feet per second is not obtained, and the writer has known several of such apparatus that have worked the wrong way—i. e., passed the warm air out of doors instead of drawing cold fresh air in.

Again, such apparatus are supplied with dampers to keep the coils from freezing, etc., and to prevent the passage of cold air when the coil or radiator is not in use. The habit is to neglect this damper, and in nine cases out of ten it remains permanently closed.

Baldwin evidently considers it a good plan to have some direct radiation, in addition to the indirect, in all school-rooms, the former to be used in very cold weather. He says this direct heating surface should be on the cold walls of a building or under the windows, so as to counteract the loss of heat from the bodies of the scholars, which radiates to the cold walls and glass, and also to prevent the fall of very cold currents of air from the glass to the floor, along which it usually flows to the outlets, etc., keeping the children's feet in a lower stratum of air a foot or so high, and ten or fifteen degrees colder than the air at the breathing or head line.

School-rooms for small children should have an ample system of indirect radiation that will admit from 500 to 1,000 cubic feet of air per hour per capita, and it should be so arranged that the regulation of the temperature will not lessen the air-supply. There are several good methods of accomplishing this known to heating engineers. The air should enter the room averaging in temperature from 80° to 100°, according to the outside temperature. In addition to this there should be the direct coils before mentioned.

For healthy youths or adults, as in your case, the air-supply should not be less than 1,500 cubic feet per capita, and if they are not confined to one position too long the addition of the direct coils is not so important.

The place for air to leave a room depends largely on the system of heating and ventilation used. When air enters through one or more large registers they may be near the floor or ceiling, according to circumstances, and if large quantities of air are admitted the position is not so very important.

When they are near the ceiling the flow of air from them should be directed to the coldest side of the room. When they are near the floor it is perhaps best to have them at the coldest side of the room, and they should have large area, so the current of air will be slow as it passes them. The air soon finds the ceiling and afterwards follows the same motions as it would were it admitted at a higher level.

The outlets for the systems just mentioned should be at the floor on the inner sides of the rooms, and the vent-flues are better in partition or at least warm walls.

In the designing of a building if it is inconvenient or impossible to get the heat-flues near the outer sides of the rooms, they may be put in the inner walls. If the outer walls are hard-finish, unfurred, and with much glass surface, then auxiliary coils are a great advantage for cold weather, as the two problems must always go together in cold climates—i. e., proper warming as well as proper ventilation.]

SANITARY REGISTRATION OF BUILDINGS IN LONDON.

A Bill to Provide for the Sanitary Registration of Buildings. Prepared and brought in by Mr. Lacasta, Dr. Fairquharson, Sir Guyer Hunter, Dr. Cameron, and Sir Henry Roscoe.

Be it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in the present Parliament assembled, and by the authority of the same, as follows:

1. *Short title.*—This act may be cited as the Sanitary Registration of Buildings Act, 1887.

2. *Commencement and Extent of Act.*—From and after the first day of January, One thousand eight hundred and eighty-eight, the provisions of this act shall come into operation in the following parts of the United Kingdom, that is to say in the city of London, and in the area which is under the jurisdiction of the Metropolitan Board of Works; also in all other towns or districts within the area of a local authority under the Public Health Acts, of 2,000 inhabitants and upwards; and in any other district where the local authority shall adopt the act.

3. *Sanitary Registration Authorities.*—The corporation, local board of health, or other local authority charged with the administration of the Public Health Acts, shall become sanitary registration authorities under this Act for their respective areas, towns, or districts; and in every district where there may be no local authority under the Public Health Acts, or where there may be more than one local authority under the said Acts, the Local Government Board shall determine under what authority this Act shall be administered.

4. *Appointment of Sanitary Registrar.*—Each sanitary registration authority constituted by this Act shall appoint its clerk or some other person as sanitary registrar, who shall, under the direction of the sanitary registration authority, issue notices and certificates as required by this Act, and as given in the schedule hereunto annexed, and keep a record of the same in appropriate books to be supplied by the Local Government Board, and make such returns to the Local Government Board from time to time on approved forms as such Board may direct.

5. *Notices to Owner, Lessee, Sub-lessee, or Occupier.*—Previous to the first day of June, One thousand eight hundred and eighty-eight, each sanitary registration authority constituted by this act shall cause notice to be sent to the owner, lessee, sub-lessee, or occupier of every building occupied or intended to be occupied, either permanently or temporarily, within the area of its jurisdiction, informing the said owner, lessee, sub-lessee, or occupier of the provisions of this act (in the manner set forth in Form A in the schedule hereunto annexed).

6. *Sanitary Certificate to be Deposited.*—After the passing of this act the owner, lessee, sub-lessee, or occupier of every building used or intended to be used as a school, college, hospital, asylum, hotel, or lodging-house shall, and the owner, lessee, sub-lessee, or occupier of every other building, may cause to be deposited with the sanitary registration authority (in the manner set forth in Form B in the schedule hereunto annexed) a sanitary certificate, signed and sealed by a licentiate in sanitary practice, that is to say, a person or corporation duly licensed by the Local Government Board in accordance with this act.

7. *Licentiate in Sanitary Practice.*—The Local Government Board shall issue licenses in sanitary practice to the following persons and corporations, that is to say, (1) members of the Royal Institute of British Architects, members of the Institution of Civil Engineers, and members of the Royal Institute of Architects of Ireland, who are registered in accordance with this act as qualified in sanitary practice; (2) architects and civil engineers who have been in practice three years at the passing of this act, and who shall, before the first day of January, One thousand eight hundred and ninety, prove to the satisfaction of the Local Government Board that their practice as architects or civil engineers has been a bona fide one, and has included the designing and carrying out of constructive sanitary works; (3) sanitary associations incorporated by license of the Board of Trade; (4) medical practitioners registered as qualified in sanitary science; (5) persons who are medical officers of health at the passing of this act; (6) such other persons as the Local Government Board may consider qualified.

8. *Licenses in Sanitary Practice.*—The Local Government Board shall grant licenses in sanitary practice free of charge to members of the Royal Institute of British Architects, members of the Institution of Civil Engineers, and members of the Royal Institute of Architects of Ireland, who are registered in accordance with this act as qualified in sanitary practice, also to medical practitioners registered as qualified in sanitary science, and to persons who are medical officers of health at the passing of this act; for each other license granted under this act the Local Government Board may charge a fee not exceeding five guineas.

9. *Certificates of Competency in Sanitary Practice.*—The governing body of each of the following institutions, that is to say, the Royal Institute of British Architects, the Institution of Civil Engineers, and the Royal Institute of Architects of Ireland, shall issue certificates of competency in sanitary practice to the members of the institution who, in the opinion of at least five examiners appointed by the said governing body, are qualified to design and carry out constructive sanitary works, and for each certificate thus issued the said governing body may charge a fee not exceeding three guineas; and the said governing body shall deposit with the Local Government Board a duplicate of each certificate of competency in sanitary practice issued under its authority.

10. *Sanitary Arrangements to be Certified.*—It shall not be lawful for any person or corporation to sign or seal a sanitary certificate under this act for any building where the arrangements are not strictly in conformity with the following requirements—that is to say, (1) each water-closet shall have a flushing service, which shall be distinct and separate from every other water service, and no cistern shall be connected with any pipe which is in direct connection with a soil-drain; (2) each soil-pipe shall be ventilated above the highest window on the side of the building where the pipe is situated; (3) the drains shall be ventilated by means of a soil-pipe, or by a separate pipe above the highest window on the side of the building where the pipe is situated; (4) water-closets shall be trapped, and they shall be the only arrangements inside the building having pipes directly connected with a soil-drain; (5) there shall be an air-chamber with disconnecting syphon-trap, or an inlet disconnecting syphon-trap, which shall be easy of access, on the soil-drain between the building and the public sewer.

11. *Buildings not to be used unless Certified.*—After the first day of January, one thousand eight hundred and ninety, it shall not be lawful for any building to be used as a school, college, hospital, asylum, hotel, or lodging-house, either permanently or temporarily, unless and until a sanitary certificate has been deposited with the sanitary registration authority, and a sanitary registration certificate has been issued in accordance with the provisions of this act.

12. *Penalty for Giving False Certificate.*—Any person or corporation certifying the sanitary condition of any build-

ing under this act shall be deemed to have examined the arrangements certified, and for the issue of a false or misleading certificate shall be liable upon conviction before a justice of the peace to a penalty not exceeding ten pounds, with or without forfeiture of right to certify as may be determined; and every person or corporation willfully signing or sealing a false certificate under this act shall be guilty of a misdemeanor and punishable accordingly.

13. *Penalty for Letting or Occupying an Uncertified Building.*—Any owner, lessee, sub-lessee, or occupier of a building required to be certified under this act shall be liable if such building be not certified in accordance with this act to a penalty not exceeding ten pounds upon conviction before a justice of the peace; and for every day during which such building shall be occupied contrary to the provisions of this act, the owner lessee, sub-lessee, or occupier shall be liable to a further penalty of one pound, and these penalties shall be recoverable by the sanitary registration authority before a justice of the peace.

14. *Lapse of Certificate.*—After a period of five years from the date of any sanitary certificate or sanitary registration certificate under this act any such certificate shall lapse, and the building to which it refers shall be considered as uncertified; and in case of an alteration of or addition to any certified building which affects the operation of or access to the sanitary arrangements of such building, the said building shall be considered as uncertified; in each case the existing certificates must be endorsed or new certificates must be obtained in accordance with this act in the same manner as if the building had never been certified.

15. *Books and Forms to be Supplied by Local Government Board.*—All books required to be kept by this act, and forms for carrying out the act, also forms for making returns to the Local Government Board, shall be the same in all districts, and shall be supplied direct by the Local Government Board, except in cases where the said board shall otherwise direct; the cost of all books and forms supplied by the Local Government Board under this act to be paid by the local authority or institution receiving the same.

16. *Rights of Appeal against and by Local Authority.*—Each sanitary registration authority shall decide within its own area, town, or district, what buildings are being used as schools, colleges, hospitals, asylums, hotels, or lodging-houses; the decision of the sanitary registration authority shall, however, be subject to an appeal to a justice of the peace by the owner, lessee, sub-lessee, or occupier of any such building or by any ten ratepayers in the area, town, or district; provided that notice of appeal is given to the sanitary registration authority and a justice of the peace within fourteen days of the date of the decision objected to, and such notice of appeal shall state fully the grounds of objection; the decision of a justice of the peace shall only be subject to an appeal to the Local Government Board within twenty-one days, and the decision of the said Board shall be final.

17. *Act not to interfere with other Acts.*—This Act shall not be construed as in any way interfering with the Public Health Acts, or with any powers which the local authorities possess under any other acts, but in the absence of conclusive evidence to the contrary, the certificates issued under this act shall be regarded as proofs of the satisfactory sanitary condition of the buildings to which they refer.

KITCHEN BOILER ARRANGEMENT AT RESIDENCE OF H. C. FAHNESTOCK, ESQ.

THE accompanying illustration shows the setting of kitchen boiler and pipes in the residence of Mr. Fahnestock, corner Madison Avenue and Fifty-first Street.

The boiler is a double boiler of heavy copper, with dome head, set on a Lockwood pattern stand, and holds eighty gallons. The pipes and fittings are all of polished brass. The hot-water supply pipes, both street and tank pressure, are each provided with a 1/2-inch return-circulation pipe. The pass-over pipe from the tank-supply has its inner valve within easy reach, allowing the street boiler to be filled from the tank at pleasure. The hot-water supply to the kitchen sink is taken below the floor and brought up again through the marble safe, which latter is carried around under the boiler as shown. The pipes where they are brought through the marble are finished off with neat polished brass flanges.

The pipes suspended from the ceiling are provided with wheel stop-valves and pet-cocks to allow either the shutting off or the emptying of the whole water-supply system. The kitchen sink is of porcelain, with slab, back, side, and apron of marble.

The safe is also provided with a marble surface.

EXPLANATION OF DIAGRAM.

- A. Cold-water supply to street boiler.
- B. Hot-water supply from street boiler.
- C. Cold-water supply to tank-boiler.
- D. Hot-water supply from tank boiler.
- E. By-pass for supplying street boiler from tank.
- F. Hot-water circulation-pipe on street-supply system.
- G. Hot-water circulation-pipe on tank-supply system.
- H. Water-back connection, cold.
- K. Water-back connection, hot.
- N. Sediment-pipe.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

MACHINE FOR TESTING STRENGTH OF BUILDING MATERIALS WANTED.

OFFICE OF INSPECTOR OF BUILDINGS,
CITY HALL, ST. PAUL, MINN., May 27, 1887.

SIR: Can you send me the name and location of some concern or firm where I can get a machine for the testing of the crushing strength of stone, brick, and the like? If you can give me the above information, you will oblige a subscriber to your valuable journal.

Respectfully yours, GATES A. JOHNSON.

[Referred to our readers.]

FLOOR FOR ALE BREWERIES AND PROTECTION FOR IRON FLOORS.

NEW YORK CITY, April 20, 1887.

SIR: If of interest to your subscribers, I would solicit replies to the following questions:

1. What makes the best floor for ale-brewers' storage and work rooms?

2. What covering do foreigners give to the iron floors they use for such purposes, to prevent the rusting of the iron?

Yours truly, ARCHITECT.

[1. The best material used for floors in brewer's storage and work rooms is composed of a foundation of concrete, upon which is laid one or two inches of natural rock asphalt, this material giving the most satisfactory work as stated to us by four of the largest brewing firms visited in this city, where the Seyssel, Neuchatel, and Lobsann rock asphalt has been used.

2. No iron is used for floors by Dreher, a large brewer in Vienna, nor by Truman, Hamburg & Co., manufacturers of London stout, but the material used is concrete and Seyssel rock asphalt.]

PLUMBING CATECHISM QUERY.

SPRINGFIELD, MASS., May 2, 1887.

SIR: Referring to "Plumbing Catechism," April 30, Question 17, why should not "such a pipe be put in"? What would be proper practice? Yours truly,

A. M. KNIGHT & SON.

[Referred to the Author of the "Plumbing Catechism."]

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

A NEW STONE-BREAKING MACHINE.

A STONE-BREAKING machine is in use by the corporation of Burnley, Eng., for converting waste material, such as old granite sets, old flags, etc., into suitable material for road-making. The machine may be described as a combination of a "napping" motion stone-breaker, with a series of various-sized mesh sieves, arranged in a graduated scale from the largest downward. To these sieves is imparted a mechanical shaking action. The material passed through the stone-breaking machine is rendered into the largest series of sieves, which, after sifting, rejects the pieces that will not pass through, sending them down a shoot. This action is repeated down the whole series, so that the material rendered from the last sieve is a sharp, clean gravel or sand. Each shoot therefore deposits its separate heap of material of different sizes, ready for such purposes as it may be most suitable for, road-mending, bedding for cubes, grouting, etc. Mr. John Edward Stafford, the Borough Engineer, is the inventor of this machine, which is claimed to be much more economical and serviceable than the old system of breaking up rejected material by hand.

SEWERAGE OF CEDAR RAPIDS, IOWA.

WE have received from Mr. Chester B. Davis, of Chicago, the engineer of the works, a copy of the specifications, which seem to be quite full, and to have been carefully prepared.

AMERICAN PUBLIC HEALTH ASSOCIATION.

THE fifteenth annual meeting of the American Public Health Association will be held at Memphis, Tenn., November 8-11, 1887. The Executive Committee have selected the following topics for consideration at said meeting:

- I. The pollution of water-supplies.
- II. The disposal of refuse matter of cities.
- III. The disposal of refuse matter of villages, summer resorts, and isolated tenements.
- IV. Animal diseases dangerous to man.

The Local Committee of Arrangements at Memphis have already begun the work essential to a large and successful meeting. A circular will be issued in ample time before the meeting, giving full information in regard to transportation and hotel rates. All communications relating to local matters should be addressed to G. B. Thornton, M. D., Chairman Local Board of Health, Memphis, Tenn. For particulars address Irving A. Watson, of Concord, N. H., who is the Secretary.

E. G. LOVE, Ph.D., Gas Examiner.

CONVENTION OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

THE American Society of Mechanical Engineers began its session at Willard Hall, Washington, May 31, at 10 A. M.

The convention was called to order by the President, Mr. George H. Babcock, of New York City.

Chief Engineer Loring introduced Commissioner Webb, who extended a cordial and hearty welcome to the members, at the same time paying an appreciative tribute to the advance made in mechanical science.

The president of the convention, in response, said that the American people were hardly aware of the beautiful metropolis which the Capital City had become. The ultra worship of foreign ideals prevented many from admiring anything unless they see the trade-mark upon it of some foreign country. He thought that the Capitol building was the most beautiful structure of the kind in the world. He spoke of the splendid streets and avenues here, of their cleanliness, the beautiful residences and fine public buildings, which he said were only equaled by the warm hospitality of the people.

The business of the session was then begun, and the reading of the reports of committees called for. Mr. Henry R. Towne read the report of the committee on uniform tests and Mr. George M. Bond the report of the committee on standard threads for wrought-iron pipe, etc. The secretary, Mr. F. R. Hutton, presented the report of the council, which stated that, through Mr. Stephen W. Baldwin, the society has come into the possession of much of the expert apparatus belonging to the late Mr. John C. Hoadley, of Boston. There has been added to the library the Transactions of the Institutions of Mechanical Engineering of Great Britain from 1847 to date; also the Journal of the Iron and Steel Institute of Great Britain since 1873. He also reported that the following had been

ELECTED TO MEMBERSHIP:

Charles A. Ashburner, George S. Barnum, M. O. Beltingrodt, Frank M. Bigelow, William O. Bole, John Coffin, William E. Crane, George E. Dixon, Eliher Dodds, Seymour C. Dutton, Louis G. Engle, John M. Erwin, John R. Freeman, Stephen J. Geogheghan, Webster V. Gould, Robert Hardie, William F. Henry, James A. Horton, Edmund Kent, W. C. Lambert, Frank M. Leavitt, John F. Lewis, G. J. Mailleut, Albert H. Mansfield, John Metcalf, J. G. A. Meyer, J. O. Nicolls, Frederick V. Owen, Harry de B. Parsons, Frederick H. Prentis, Benjamin F. Radford, George S. Rider, J. T. Ridgway, Robert T. Herbert, Louis Schutte, Walter W. Scott, William Simpkins, Charles H. L. Smith, Charles Steel, Walter G. Stewart, Francis H. Stillman, John Thomson, George A. Tobey, Edgar G. Tuttle, Frank Van Vleck, Jesse Warrington, George E. Whitehead, John F. Wilcox, De Volsen Wood. Associate members: Thomas H. Brooks, James A. Gilkerson, Charles L. Huston, Albert A. Noye, W. C. Temple, A. F. Zahm. Junior members: Hugh V. Conrad, Alexander S. Garfield, William L. Lyall, Edward H. Mumford, S. Tompkins. Total, 60.

The president appointed the following committee to nominate officers: H. A. Ramsay, Baltimore, Md.; T. J.

Borden, Fall River, Mass.; W. H. Doane, Cincinnati; W. H. Weightman, New York; F. H. Underwood, Tolland, Conn.

The secretary read an invitation from Mr. John D. Ford to visit the Baltimore Training School, and also a communication from Mr. John W. Weston, Commissioner General for the United States to the Paris International Exposition of Railway Appliances and Industries, urging the society to co-operate in making that exhibition a success.

The following papers were presented: "Tests of comparative value of different kinds of belting," by Samuel Webber; "Should a piston packing ring be of the same thickness at every point," by L. H. Rutherford; "Systematic testing of turbines in the United States," by R. H. Thurston; "Helical seams in boiler-making," by R. H. Thurston. The reading of these papers was followed by discussions. The consideration of various topics of interest to the profession was then begun and occupied the remainder of the morning session.

The following names of members and guests were entered on the register of the society as present at the meeting: F. R. Hutton, Secretary, New York; George F. Babcock, New York; J. W. Sargent, Scranton, Pa.; Joseph H. Springer, Hamilton, O.; James A. Horton, Boston; F. L. Bigelow, New Haven; Thomas W. Capen, Stamford, Conn.; William Hewitt, Trenton, N. J.; J. M. Robinson and John Livingston, New York; Peter Kirkeverg, Youngstown, O.; Thomas R. Almond, Brooklyn; Charles H. Loring, Washington, D. C.; Charles T. Porter, New York; Alfred B. Couch, Philadelphia; John T. Hawkins, Taunton, Mass.; H. C. Francis, Philadelphia; George W. Weeks, Clinton, Mass.; Gustav Hillman, City Island, N. Y.; John F. Wilcox, Pittsburgh, Pa.; W. H. O'Dell, Yonkers, N. Y.; Moses G. Wilder and wife, Philadelphia; George F. Barrus and wife, Boston; Henry I. Snell and wife, Philadelphia; F. H. Stillman and wife, Brooklyn; A. C. Stiles and wife, Middletown, Conn.; F. H. Underwood, Tolland, Conn.; J. T. Ridgway, Trenton, N. J.; J. Q. Wright, New York; M. Gould, Norwich, Conn.; George M. Bond, Hartford, Conn.; George S. Strong, New York; William L. Lyall, New York; Edward L. Dent, Washington, D. C.; W. E. Stewart, Reading, Pa.; Thomas J. Borden, Fall River, Mass.; Charles Sperry, Fort Washington, L. I.; David Townsend and wife, Philadelphia; S. Tompkins, Crozet, Va.; E. C. Dicey, Chicago, Ill.; S. Ashton Hurd, Pennsylvania; E. H. Parks, Providence, R. I.; George E. Whitehead, Providence, R. I.; Richard W. Bailey, Pittsburgh; Baxter D. Whitney and daughters, Massachusetts; William L. Whitney, Massachusetts; Olie Scott, Bennington, Vt.; Daniel Ainsworth, Pittsburgh; J. G. Gilkerson, Homer, N. Y.; Charles W. Barnaby and wife, Salem, O.; J. A. Taylor, Wilmington, Del.; H. Van Duzen, Bayonne, N. J.; James Brady, Brooklyn; F. H. Richards, Hartford, Conn.; Edward H. Mumford, and mother, Omaha, Neb.; C. S. Dutton and wife, Youngstown, Ohio; L. B. Moore, New York; E. Fawcett, Alliance, Ohio; W. H. Wyman, Worcester, Mass.; H. S. Downe, Pittsfield, Mass.; Allen Sterling, New York; Grant Curtis, Pittsburgh, Pa.; J. F. Holloway, Cleveland, Ohio; Joseph Gobeille, Cleveland, Ohio; S. T. Wellmar, wife and daughters, Cleveland, Ohio; Thomas C. Sheldon, Boyleston, Mass.; Vincent G. Hazard, Wilmington, Del.; C. H. Woodbury, Boston, Mass.; A. Lorge and wife, Rochester, N. Y.; James Morgan, Jr., and wife, Johnstown, Pa.; Charles E. Emery and wife, New York; Albert Stearns, Brooklyn; Allen Stirling, New York; A. Plamondon, Chicago; James Mahony, New York; Wm. H. Weightman, New York; George Schuhmann, Reading, Pa.; J. A. Tilden, Boston; O. C. Woolson, Newark, N. J.; J. H. Webster Boston, Mass.; W. C. Mackinney, Philadelphia; A. C. Christensen, Brooklyn; S. Wilcox, New York; W. H. Wiley, New York; Morgan Brooks, Boston; Alexander Miller and lady, New York.

The afternoon was spent by the members, in visiting the Corcoran Art Gallery, the Capitol, and other points of interest.

A second session was held at 8 P. M.

[Remainder of report of the meeting will appear in our next issue.]

FIRST ANNUAL REPORT OF THE WATER-WORKS COMMISSIONERS OF KINGSTON, MASS. 1886.

These works cost, including land damages, \$40,894.15. Water is taken from a well 20 feet in diameter and 18 feet deep. This has never yielded less than 79,000 gallons per day. A Blake duplex pump, with 5-inch cylinder and 12-inch stroke, driven by a Burnham turbine 17-horsepower water-wheel, takes this through 240 feet of 8-inch suction-pipe, and forces it to a height of 196 feet and 900 feet distant to a reservoir 50 feet in diameter and 18 feet deep, built of brick with walls 2 feet thick at bottom and 16 inches at top, with a concrete bottom 16 inches thick; capacity, 265,000 gallons. There have been laid 8,738 feet of 8-inch pipe, 18,621 feet of 6-inch, and 13,574 feet of 4-inch, 5 fire-hydrants set, and 81 connections made. Present consumption is 10,000 gallons daily. Mr. M. C. French is superintendent, Mr. Arthur H. Howland, of Boston, was engineer, Mr. W. C. Boyce, of Worcester, engineer in charge, and Messrs. Thomas F. Meaney & Co., of Boston, contractors.

REPORT OF WATER COMMISSIONERS OF BINGHAMTON, N. Y. 1886.

During the year 10,103 feet of iron pipe have been laid, and 10,753 feet of cement-pipe have also been replaced by iron pipe, making a total of 21 miles of iron pipe and $7\frac{1}{2}$ miles of cement pipe now in use.

An experiment has been made of boring an 8-inch well to the depth of 1,000 feet, all but 30 feet of which was in the rock. The supply of water was inconsiderable, and the cost of the well was \$5,205.

To meet the emergency of a drought, a crib has been sunk in the centre of the Susquehanna River and joined to the pump-wells by a 30-inch pipe. At all ordinary times the supply from the wells is sufficient. The total cost of the crib and pipe was \$6,016, of which the pipe cost \$1,048.

The net earnings for the year were \$31,219. The total pumping capacity is 8,000,000 gallons per day, and the average amount pumped 2,459,525 gallons; average head pumped, 144 feet; number of gallons pumped for each cent's worth of fuel, 6,063; total cost for each 1,000,000 gallons raised one foot high, 4.03 cents; of which the fuel cost 1.14 cents. The duty was 53,994,000 pounds feet per one hundred pounds of coal.

Thirty hydrants, 20 meters, and 263 service-pipes have been added during the year. The 237 meters in use have cost an average of 67 cents each for repairs for the year. The system is the direct pressure, and fire-pressure was raised thirty times. Of the 14 breaks in pipes 13 were in the cement pipes.

Mr. D. Fetter is the superintendent.

MUNICIPAL REPORTS OF THE CITY OF NORFOLK, VA.

The municipal report of Norfolk is in the form of a message from the Mayor, Mr. Barton Myers, which shows the progress made by this thriving town. The sewerage system, originally built from plans of Col. George E. Waring, now comprises twelve miles of sewers, and has cost \$188,500. About one-fourth of the houses in the sewered section have been connected, and the amount of sewage and water now pumped is 590,000 gallons per day. The syphon devised by the City Engineer, Mr. W. T. Brooke, is working satisfactorily.

Large improvements in the water-service have been made under the direction of the Superintendent, Mr. H. L. Smith, and the average quantity of water now pumped is 1,440,853 gallons daily, with a yearly revenue of \$46,764.

Attention is called to the irregular manner in which the streets in outlying districts are being laid out.

The engineer recommends also that in the future all sewers be built by the city and by men under his control. No tabular statements of cost of pumping, etc., are given.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

At a meeting on Wednesday evening, June 1, 1887, President William E. Worthen in the chair, John Bogart Secretary, the secretary gave a résumé, prepared by himself, of the recorded experience with iron and wooden ties on railroads; the feature of the paper being a description of the "German system of permanent way with iron substructure." It was stated that several papers had been received, but the authors had prepared them to be read at the convention. It was announced that arrangements had been made with the trunk-line railways by which members attending the convention from the West who paid full fare on would, on presentation of a certificate that they had attended the convention, secure return ticket at one-third the regular fare.

The following were elected as members:

Frank Bruen (Cornell University, 1878), Civil Engineer, New Haven, Conn.; Henry Manson Byllesby, Pittsburg, Pa.; Samuel Barrett Cushing, Providence, R. I.; Herbert Clark Felton (Rensselaer Polytechnic, 1866), Secretary, Treasurer, and Superintendent Kaighus Point and Philadelphia Ferry Co., Camden, N. J.; Silas Bent Russell (Washington University, St. Louis, 1881), Engineer in charge of Water Distribution of St. Louis, Mo.; Robert Somerville (University Virginia, 1869), Assistant Engineer Board of Mississippi Levee Commissioners, Greenville, Miss.; William Parsons Watson (Yale College), Resident Engineer in charge of Location and Construction Montana Central Railway, Helena, Montana.

As Juniors:

Benjamin Douglas, Engineer of Bridges Michigan Central Railroad, Detroit, Mich.; Joseph Yendes Wheatley (School of Mines, Columbia College, 1886), Assistant in Chief Engineer's Office New York Central and Hudson River Railroad, New York City.

EXPLOSION IN A SEWER.

PHILADELPHIA has recently experienced quite an explosion in one of the main sewers, attributed to the ignition of sewer-gas. There is no doubt that Philadelphia sewers contain filth enough to generate a dangerous gas, but this particular explosion is probably due to leaks from some gas-main.

SCHOOL HYGIENE: THE LAWS OF HEALTH IN RELATION TO SCHOOL LIFE. By Arthur Newsholme, M. D. 143 pp., octavo. London: Swan, Sonnenschein, Lowrey & Co. 1887.

Dr. Newsholme is the Medical Officer of Health for Clapham and the Medical Examiner of Pupil Teachers to the School Board for London, so that he may be considered as good authority on the subject of which he writes. His book is a plain, sensible little work intended mainly for the information of masters of schools and of teachers, but well calculated also for the instruction of parents, whose intelligent co-operation with school authorities is so necessary to secure the best results. It is divided into two parts, the first relating to the sanitary desiderata to be kept in view in the site, construction, furnishing, heating and ventilation, and drainage of school buildings; the second treating of the studies, exercise, diet, etc., of scholars, with chapters on communicable diseases and accidents. The suggestions made under each head are in accord with modern sanitary science, and there is an agreeable absence of attempts at emotional exhortation and fine writing. One could wish that a little more had been said on some points. As, for instance, in speaking of dog-bites, and of the usual impossibility of ascertaining at once whether the dog is mad, it would have been well to note the importance of preserving the dog alive when this can be done, in order to secure precise information on this point, which would in many, in fact most, cases prevent unnecessary anxiety and worry. So also the advice that during a convulsion of epilepsy the patient should be "prevented from biting his tongue if possible," might well have been supplemented by a statement as to how this is to be done by placing something between the teeth, and the precautions needed to keep this something from falling into the throat and choking the patient.

These are very small defects, however, and we are glad to commend the book to all school teachers and trustees as well worth reading, and as a desirable addition to a school library.

MR. CONDER, Professor of Architecture at Tokio, Japan, says that there is nothing in the method of construction of the Japanese buildings which render them especially suited to withstand the shocks of earthquakes. Seismologically, they are exactly opposite to what earthquake buildings should be. They are extremely top-heavy to begin with, and have no ties or braces whatever of the ordinary kind. In the earthquake shocks common in Japan, the buildings sway about in the most alarming manner, and no earthquake advantages would ever be claimed in respect of these buildings. The pagodas might be likened to card-board houses having a central post put in the middle for the purpose of stiffening them; but it was curious that certain of these posts did not touch the ground.

PERSONAL.

MR. FRANK CROCKER and Mr. R. E. Smith, architects, of Chattanooga, have formed a copartnership under the firm name of Crocker & Smith.

ARTHUR BATE has been appointed Building Inspector of Milwaukee for the ensuing four years. He is an old Milwaukee builder.

ENGINEERS' CLUB OF PHILADELPHIA.

A REGULAR meeting was held May 21, 1887, President T. M. Cleemann in the chair; 33 members and 4 visitors present.

There was some further discussion of the form and arrangement of the proposed U. S. C. and G. Survey Map of the Delaware and Schuylkill Rivers near Philadelphia. The consideration of a resolution expressing the views of the club was deferred till the next business meeting.

The Secretary presented two communications from Captain S. C. McCorkle, embodying data on the "Retardation of the Tide in the vicinity of Philadelphia," etc. The Secretary presented for Mr. W. L. Hoyt, a multiplication table, from 1 to 25, for the Reference Book.

Mr. John L. Gill, Jr., presented an illustrated discussion as to whether the custom of upsetting the ends of bridge rods should be abandoned.

Mr. Arthur Marichal read an illustrated paper on the construction of reservoir walls.

Some discussion followed.

Mr. J. E. Codman presented a diagram for the regulation of dimensions, etc., of cast-iron flange-pipes, the object being to establish, upon the basis of mathematical proportions, the diameters of flanges and bolt circles, sizes and numbers of bolts and thickness of metal for different diameters of pipes.

Mr. Edward Hurst Brown described a test he had witnessed of fire-resisting paint.

Mr. R. Meade Bache exhibited a safety self-extinguishing car-stove.

ARCHITECTURAL COMPETITIONS.

PURSUANT to a resolution of the Board of Armory Trustees of Cincinnati, Hamilton County, O., architects are invited to submit plans, drawings, and specifications for the erection of an armory in the city of Cincinnati, upon a lot fronting 168 feet 8 inches on the west side of Freeman Street, 112 feet south of Flint Street, and extending west 300 feet to Denman Street, fronting 179 feet $4\frac{1}{2}$ inches thereon.

The armory must contain accommodations for a regiment of infantry, composed of twelve companies, and one battery of artillery, with accommodations for the various field and staff departments.

Plans will be received until noon of Wednesday, June 22, 1887, at the office of the County Commissioners. The board reserves the right to reject any and all plans. William B. Smith is the chairman of Board of Trustees, and E. Cort. Williams, clerk.

BRANCH COUNTY, MICH.—The supervisors are to consider competitive plans for a new court-house at Coldwater, cost not to exceed \$40,000.

COMPETITIVE designs are now called for the group of statuary that is to ornament the San Francisco City Hall, for which James Lick left \$100,000.

ENGINEERING COMPETITION.

SAN FRANCISCO, CAL.—The Board of Supervisors has postponed indefinitely the proposition to employ Colonel George E. Waring, Jr., to prepare plans for the city sewerage, and have decided to advertise for plans, specifications and a report embracing estimates of cost of providing a sewer system for the city. The author of the best plan will receive \$2,500; the next best, \$1,500, and the third, \$1,000. The first-prize man is to be supervising engineer and the others, first and second assistants in the order of their standing.

THE BENNINGTON MONUMENT.

THE monument to commemorate the battle of Bennington, near Bennington, Vt., has been awarded to Mr. W. H. Ward, of Lowell, Mass. The monument is to be paid for from funds contributed, \$40,000 by the general Government; \$25,000 by the State of Vermont; \$5,000 by the State of New Hampshire, and \$10,000 by Massachusetts. The pillar or obelisk, 308 feet high and 40 feet square at base, built of dolomite. Mr. S. H. Rinn, of Boston, is the architect.

THE Manufacturers' Association of Brass and Iron Steam, Gas and Water Work, which has been in successful operation for the past year and a half, has been recently strengthened by the formation of local associations of the dealers in plumbers' and steam fitters' supplies in the various cities. These local associations have for their object a closer intimacy between local competitors, that customs which have exercised a demoralizing influence on the trade may be done away with, and that through a permanent organization their interests may be identified with the Manufacturers' Association. The associations thus far formed are as follows: Boston—President, J. V. N. Stultz; Secretary, George Phillips. New York—President, John Simmons; Secretary, C. S. Stephens. Baltimore—President, Samuel Register; Secretary, F. X. Russell. Washington—President, Thomas Somerville; Secretary, E. G. Schafer. Pittsburg—President, W. B. Farrell; Secretary, J. Atwood. Cleveland—President, George Denning; Secretary, C. J. Hills. Detroit—President, Samuel Ferguson; Secretary, James Harvey. Cincinnati—President, F. Lunkennheimer; Secretary, George Clark. Chicago—President, John Clifford; Secretary, S. McKeeby. St. Paul—President, C. S. Rogers; Secretary, C. A. Fuller. Omaha—President, S. K. Felten; Secretary, H. T. Lally. Kansas City—President, C. C. English; Secretary, J. B. Rahn.

PUBLICATIONS RECEIVED.

IMPROVED PLUMBING APPLIANCES. By J. Pickering Putnam, Architect. With ninety-four illustrations. 8vo, pp. 220. New York: W. T. Comstock. Price, \$1.50.

THIRTY-THIRD ANNUAL REPORT OF BIRTHS, MARRIAGES, AND DEATHS in the State of Rhode Island for the year ending December 31, 1885. Prepared by Charles H. Fisher, M. D., State Registrar of Vital Statistics and Secretary of the State Board of Health. 2mo., paper, 198 pp.

SEVENTEENTH ANNUAL REPORT OF THE TRUSTEES OF THE COLUMBUS, OHIO WATER-WORKS, for the year ending March 31, 1887, together with the reports of the Secretary Superintendent, and Chief Engineer. A. H. McAlpin, Chief Engineer.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 5-6-7-8.

WATER, SEWERAGE, ETC.

JANESVILLE, WIS., May 26, 1887 (special).—The Mayor and Common Council of this city, subsequent to publication of notice to contractors, with specifications, by the Water Commissioners, granted a franchise of our water-works to Turner, Clark & Rawson, of Boston, and the Commissioners were compelled to notify contractors that no bids could be accepted, and none were received.

Turner, Clark & Rawson are to construct 13 miles of main, with 180 hydrants thereon, for \$4,200 rental, and \$25 rental for hydrants on extensions. They are to construct a reservoir of 700,000 gallons for storage purposes, and also a stand-pipe to furnish artesian water already provided by the city, but are to pay for the well. They are to furnish and supply four public fountains and supply churches and schools without charge; are to begin work by June 10, and finish in a year. Their engineer is now here.

CHATTANOOGA, TENN.—City Engineer Carey will make plans for an extension of the sewerage system, to cost about \$50,000. He will also make plans for new street-pavements, to cost \$150,000.

KNOXVILLE, TENN.—The Water Company has a contract with the Knoxville Car-Wheel Works for 1,000 feet of water-mains.

LYNCHBURG, VA.—City Engineer Fosburg will prepare plans for an extension of sewerage, to cost upwards of \$75,000.

CHATTANOOGA, TENN.—The Mayor says that it is absolutely necessary, for the health of the city that the sewerage system should be better, and that it would take \$200,000 to improve it. The City Council is in favor of using the first money to promote this object.

CHATTANOOGA, TENN.—The city water company has decided to invest upwards of \$100,000 in improvements. The pumping-station will be removed two miles up the river, a new building erected, and a new steam-pump purchased.

BAR HARBOR, ME.—The contractors for the new sewerage system for this city have given up the contract. It is alleged that the town failed to keep its part of the contract, and that the contractors have lost heavily, because they took the work too low. Operations will be resumed by the town authorities in a few days, but the work will not be completed until 1888.

MANKATO, MINN.—The Sewerage Committee are undecided in regard to the use of cement pipe.

NORFOLK, VA.—No agreement has been reached on the water question between the Water Company and the Council.

HAMILTON, ONT.—The town has not yet come to a satisfactory solution of its sewage disposal problem.

SAULT STE. MARIE, MICH.—A number of Chicago, Milwaukee, and Iowa capitalists, known as the Lacrosse Syndicate, have purchased the franchise of the St. Mary's Falls Water-Power Company. The organization has the right of way for a 150-foot canal through the town, and also owns a large amount of land available for mill and factory sites, docks, etc. Two extensive flouring-mills, of 1,000 barrels capacity per day each, and a large paper-pulp mill have decided to locate

here. The capital of the company is \$1,000,000, and the cost of the work is estimated at about that amount.

DARLINGTON, S.C.—A meeting was held in the Court-house recently to discuss the question of boring an artesian well. It was decided to bring the subject before the taxpayers as to whether bonds should be issued to be used as collateral for borrowing money for the purpose, and also for building a new town-hall and market-house.

COLUMBUS, O.—The water-works will be extended.

WINDSOR LOCKS, CONN.—The Windsor Locks Water Company has just been organized. Work will be commenced at once.

OLD ORCHARD, ME.—The contract for the Old Orchard water-works is signed, and a town meeting has been called to ratify it. The work is to be completed in July. Old Orchard agrees to pay \$1,000 a year for twenty years for 25 hydrants, with the privilege of purchasing the works at the expiration of ten years at an appraisal. At the expiration of the twenty years the water-works will be the property of the town. Work will be commenced as soon as the contract is ratified.

LITITZ, PA.—The Lititz Water Company has been chartered for the purpose of supplying water for public purposes. The capital stock is \$10,000. The directors are Isaac F. Bomberger, Johnson Miller, Great G. Erb, John P. Stauffer, and Samuel Scaber.

MANSFIELD, R. I.—The necessary petitions and charters have been granted by the Legislature for the establishment of a system of water-works here by the town or by a private company. The advocates of the project now propose to have another town meeting called soon, to give the voters in the proposed Water District another opportunity of accepting the charter and of building and owning the works, as it is thought by many that it will be a great saving in the end for the town to build the works. If at the next meeting the necessary two-thirds vote cannot be obtained, the Mansfield Water Company will proceed to build them.

PITTSBURG, PA.—A recent large fire has shown the necessity for an increased water-supply on the South Side.

PHILADELPHIA.—A Committee of the Councils is preparing an ordinance appropriating \$145,000 for sewers.

SOUTH BEND, IND.—W. M. Whitten, Commissioner of Drainage, advertises the letting of about thirty-five miles of ditches in Madison township in this county.

SUMTER, S. C.—The Town Council appointed a special meeting for last night to discuss the canal and water-works questions. An artesian well or a stream in the locality are sources under discussion.

MINNEAPOLIS.—It is proposed to build a new pumping-station in the Third Ward. Although a commission has condemned lands for the site, a number of Aldermen contend that the establishment of a pumping-station as far south as the Third Ward will be a useless waste of money. They contend that to obtain a supply of pure water it will be necessary to locate the new pumping-works above the mouth of Shingle Creek.

DOVER, ME.—The engineers have been here surveying for the Water-Works Co. and have gone home. There are rumors afloat that there is a disposition on the part of the contractors to throw up the contract.

MADISON, WIS.—\$15,000 is to be spent on new water-mains this year.

BURLINGTON, IOWA, will put in Hyatt filters for its water-supply.

TOLEDO, O.—In order to judge of the advisability of accepting the proposition of Colonel Lemert, who wishes to purchase the water-works, the city will receive informal bids for buying the works.

SAVANNAH, GEO.—The press is discussing an increase of the city water-supply.

CONCORD, N. H.—The Water Commissioners have voted to extend the water-works to Pena-

cook the present season. Goodhue & Birnie, of Springfield, Mass., were awarded the contract at \$37,500. Work will be begun September 1.

The work at West Concord was reported to be substantially completed with the exception of setting the hydrants. It was voted to lay a line of pipe from the dam to the stone church immediately.

It was also decided to begin at once to extend the works to St. Paul's School. About 7,500 feet of pipe will be required for this.

The laying of a 12-inch pipe from Franklin Street to Pleasant Street through Rumford Street, and of 1,800 feet of pipe in Blossom Hill cemetery was voted. It was decided to lay pipe in Woodlawn cemetery at Penacook if it is needed.

Contracts for all the work have been made with Goodhue & Birnie.

INCORPORATED is the San Fernando Valley Improvement Company. The object is to buy, improve, and sell real estate, acquire water and water rights, build ditches, etc. The directors are, W. B. Barber, George R. Crow, F. C. Howes, R. R. Brown, and Frederick C. Howes. Capital, \$2,000,000.

BERTHOUD, COLO.—Ground has been broken in the streets of the town for the new water-works, which will shortly be completed.

HELENA, MONT.—Work on the water-works is to be begun here at once. Mr. Woolston, representing the builders, is now in Chicago purchasing material.

PALMYRA, N. Y.—A large vein of pure water about a foot in diameter was found by water-works contractors who are expecting to put in a system of works here. All that has been needed was good water. The village board held a special meeting May 27, and steps will be taken to start plans at once.

NEWARK, WAYNE CO., N. Y.—The construction of the water-works will be commenced next week.

THE Worcester water company, of Otsego County, N. Y., is incorporated with a capital of \$35,000. Members are H. H. Smith, Julius T. Headsell, Silas W. Ferguson, George Hardy, James Johnson, M. H. Nichols, Herman Wagoner, and B. Brown, all of Worcester.

ORANGEBURG, S. C.—The council have entered into an arrangement with Mr. George H. Cornelison, proprietor of the Orange Cotton Mills here, whereby the work of erecting a system of water-works is to be begun at once. The agitation of this question was begun less than two weeks ago. The only question with the City Council was as to how the necessary money should be raised.

SUMNER, WASH. T.—Nearly \$4,000 have been subscribed, and some of the citizens of Sumner will incorporate the Spring Branch Water Company. The capital stock will be \$10,000. The directors will be I. F. Thompson, E. C. Meade, W. R. Lindsay, John Kincaid, and L. N. Hudson. The object of the company is to build and construct a water-works system for public and private use at Sumner. The reservoir will be located somewhere on the hillside, and one and a half miles of 6-inch main will conduct the water under 150-foot head to the town.

SUMTER, S. C.—The Council is discussing the question of water-works.

ST. PAUL.—The Water Board has advertised for bids for clearing out the grounds for the new high-service reservoir. It will have an elevation of 300 feet above the river and 600 feet above the highest service on St. Anthony Hill, and will have a capacity of 35,000,000 gallons.

THE Vineyard Haven, Mass., Water-Works Company are laying pipes to bring the spring-water from Lake Tashmoo.

HAMILTON, ONT.—The City Council has made an appropriation for a small lot of water-pipe and fittings.

TYLER, TEX.—L. B. Fish, of St. Louis, Mo., H. H. Rowland, H. G. Askew, B. W. Rowland and J. J. Daglish, of Tyler, will incorporate as the Tyler Water Co.

APPLETON, WIS.—The construction of a reservoir will be begun immediately by the water-works company.

MARION, KAN., has made arrangements for a \$60,000 water-works and an electric-light plant.

BOOTHBAY, ME.—On May 28 Boothbay Harbor voted to have water-works. The Gardiner Water Company has the contract.

MADISON, WIS.—The Beaver Dam Water-Works Company; capital stock, \$100,000; incorporators, Ego Ferris, Joseph W. Reade, and Mark A. Warren.

CAMDEN.—The Pavonia Water-Works, which supply the city of Camden, are to be enlarged, and the city will advertise for a new pump of 10,000,000 gallons capacity per day.

NORTH EASTON, MASS.—Governor Oliver Ames, Frederick L. Ames, and Dr. George B. Cogswell have been elected Water Commissioners and instructed to proceed to build a works at once and make the necessary contracts therefor. The cost will be about \$60,000.

THOMASTON, ME.—A contract has been signed between the citizens of Thomaston and the Camden and Rockland Water Company, providing for the bringing of a water-supply into this town.

EUFALA, ALA.—J. H. Hartley, of Montgomery, Ala., has received the contract to erect a stand-pipe for the water-works.

CEDARTOWN, GEO.—The city will petition the Legislature for authority to issue \$10,000 of bonds to build water-works.

MACON, GEO.—Jesse W. Starr, of Philadelphia, will make a proposition to build water-works.

ASHLAND, NEB., will open bids at 2 o'clock P. M., June 16, for a system of water-works to cost \$13,000. A. A. Richardson, of Lincoln, Neb., is the engineer.

SACRAMENTO, CAL.—The Eldorado Water and Deep-Gravel Mining Company propose to bring a canal into this county thirty feet wide and six feet deep, capable of supplying thirty thousand inches of water, which will irrigate a territory of two hundred thousand acres. This canal will be thirty miles long, and besides irrigating lands will furnish power for manufactures in this city.

CHESTER, PA.—The South Ward Water-Works recently leased by the city have been sold to the new Chester Water Company, a corporation composed of capitalists from this city, Philadelphia, and New York. The new Chester Water Company was organized two years ago, and has a plant of considerable magnitude in construction. The old and new systems will be combined.

TOWSON, MD.—The Towson Water Company have let the contract to bore an artesian well and furnish and lay pipes to the Miller Artesian Well Co., of Baltimore.

CHATTANOOGA, TENN., will issue \$50,000 of bonds for sewerage and street improvements.

CALERA, ALA.—The Calera Land Co. have commenced work on the reservoir and wells, and are now ready to receive bids on 6 and 4-inch iron pipe delivered here.

FORT SMITH, ARK.—A. L. Pogue has just completed the improvements to the water-works here, consisting of a large new pump-house, relaying a 20-inch suction pipe, laying a 16-inch main, and putting in a new Worthington pump of 4,000,000 gallons capacity in 24 hours. This, with old pumps, will give pumping capacity of over 6,000,000 gallons per day. The new improvements cost over \$100,000. This, with the original work, will cost \$230,000.

GAS, STEAM, BUILDINGS, ETC.

WOONSOCKET, R. I.—The Woonsocket Electric-Light Company have increased their capital stock from \$50,000 to \$100,000, and will furnish power for the electric street-railway.

PITTSBURG, PA.—The Phila. Company has commenced laying pipes to supply Parnassus with natural-gas, and this week the same company will continue the work of piping Etna borough.

NEW INCORPORATION.—The Hunter Electric Company of Philadelphia, capital, \$100,000. The directors are, Rudolph Hunter, John W. Henderson, William L. Wharton, Jr., Edward Samuel, of Philadelphia, and Wharton Barker, of Jenkintown.

The Central Cast Iron Company, of Minneapolis, has been incorporated by C. C. Joslyn, W. P. Buell, C. J. Betts, D. A. Pool, G. D. Cord, Charles S. Sedgewick, Jerome Lucas, and C. P. Beard. The capital stock is \$1,000,000.

PORT TOWNSEND, WASH. T.—A movement is being made by the citizens to incorporate an Electric-Light Company with a capital of \$15,000.

NASHVILLE, TENN.—The Alexander Iron Company has been organized with a capital of \$1,000,000, to erect works for manufacturing iron at Nashville.

INCORPORATED is the Severance Nail Machine Company of St. Paul. Capital stock, \$100,000. Incorporators: G. K. Shaw, Minneapolis; J. H. Woolsey, John A. Berkey, St. Paul; W. N. Severance, Appleton; S. S. Murdock, Murdock.

ROCHESTER, N. Y.—It is understood that the Lamp Committee of the Common Council will recommend to the Council that the entire oil district be lighted with electricity, and that a contract be entered into for the immediate introduction of electricity into all the outer wards. It is said that the committee has received bids for lighting the entire city with gas exclusively at figures aggregating \$40,000 less than the present cost of lighting the streets of the city. The Brush Electric Light Company, it is said, has made a proposition much more favorable to the city than the present contract and in which they also agree to give up their present contract, furnishing both the new and the old territory at about two-thirds the present rate. The Edison Company underbids the present cost of gas, and the Rochester Electric Light Company also desires a share of the contract.

MANCHESTER, VA., is putting in an electric-light plant, the buildings for which will be erected according to plans of Westinghouse, Church, Kerr & Co., New York.

THE Equitable Gas Company of Springfield Ill., has been incorporated. President, H. M. Phillips; treasurer, Emerson Wight. The capital is \$250,000.

YANKTON, DAK.—The contract for putting in the works of the Grand Forks National Gas Company was let Tuesday to the National Gas-light and Fuel Company. The capacity of the works is 175,000 cubic feet every twenty-four hours. The Springer system has been adopted.

KEENE, N. H.—The city has contracted for twenty electric lights of the American system, to be introduced July 1.

JERSEY CITY, N. J.—The Therostatic Steam-Heating Company, whose articles of incorporation have been filed in the County Clerk's office, has been organized for the purpose of introducing a patented process of steam-heating. The capital stock of this company will be \$150,000, of which only \$1,800 has been subscribed for and is held by Joseph E. Culver, M. D., Abel I. Culver, Thomas R. Withers, and Abel I. Smith, all of this city.

MAYSVILLE, KY.—The Maysville Natural Gas Company have contracted with R. W. Evans to sink a well 1,200 feet deep.

CLEVELAND, TENN.—A company has been formed to build gas-works.

FORT WORTH, TEX.—The capital stock of the Fort Worth Natural-Gas and Artesian Water Company is \$25,000. The company will shortly commence boring for gas.

TYLER, TEX.—R. Bergfeld and others have been appointed a committee by the City Council to negotiate for the erection of gas-works.

RICHMOND, KY., has recently had organized and incorporated a company for the purpose of boring for natural-gas. The company has been organized, officers elected, and all the stock fully paid in.

COLUMBUS, MISS.—J. R. Ryan will enlarge the gas-works and put them in thorough repair.

KEY WEST, FLA.—The Key West Gas Company will erect an electric-light plant at once.

RAILROADS, BRIDGES, CANALS.

MILWAUKEE.—Incorporated is the Milwaukee Cable Railway Company. The capital stock is stated at \$300,000. The incorporators are William P. Mc Laren, George W. Mitchell, and John A. Hinsey.

MILWAUKEE.—The Blue Mound Street Railway Company are receiving bids to construct the proposed line from Forty-sixth Street across the viaduct to the first cross-road beyond the Calvary Cemetery.

MILWAUKEE.—Ordinances were introduced giving franchises to two more railroad companies. One to H. M. Benjamin and others; another to L. F. Frisby and others, for a horse or cable line.

NEW YORK.—A new railroad between New York and Boston is projected; the total cost will be nearly \$20,000,000. William T. Block, President; D. C. Linsley, Engineer; C. E. Brown, Secretary.

PITTSBURG, PA.—A \$200,000 tunnel will probably be built here. Address the City Engineer.

NEW HAVEN, CONN.—The Committee on Railroads and Bridges has voted to recommend a new iron bridge over the railroad tracks at Olive Street, the cost be divided between the city and Consolidated road. The committee also voted to recommend the purchase from the Consolidated road of another span of the worn-out Housatonic bridge for \$10,000, in order to complete Tomlinson's bridge.

BELOIT, KAN.—A line of street-railway is being built here.

TOPEKA, KAN.—A Boston syndicate has bought the Topeka city railway, and will spend \$200,000 in developing and extending the system.

TRENTON, N. J.—A new iron bridge of 150 feet span over the Delaware, Lackawanna and Western Railroad and Morris Canal, near Hopatcong station, will be built on the new road leading from Drakesville to Lake Hopatcong.

RAILROAD BRIDGE.—The Gloucester County, N. J., Board of Freeholders has decided that the new bridge which is to be built over the Raccoon Creek, between Swedesboro and Bridgeport, shall be 140 feet long, 16 feet wide, with an 88-foot draw. Estimates for both an iron and a wooden structure will be asked for from builders.

DULUTH.—The St. Louis River Water-Power Company will build a dam. Holyoke, Mass., parties will erect linen and wood-pulp mills as soon as dam is done.

THE Minneapolis Terminal Railway Company has filed articles of incorporation. Capital, \$1,000,000. Incorporators: Calvin L. Goodrich, Charles F. Hatch, L. A. Harris, Henry C. Truesdale, and Charles D. Hammond. The object is to construct a belt railway around the city.

ST. PAUL.—The City Council opened bids last week for the substructure of the up-town bridge from Forbes Street to Mohawk Avenue as follows: Arthur McMullen, \$136,119; Charles Lauer, \$159,645.75; Patrick Durack, \$175,067; A. J. Jolberg & Son, \$197,781.50; T. Saulpaugh & Co., \$158,832. The bid of Arthur McMullen was accepted, and the City Attorney, with the City Engineer, was instructed to execute a contract. The City Engineer submitted plans for the Snelling Avenue bridge, to be built by the Milwaukee road, which were approved.

HELENA, MONT.—G. W. Griggs, A. G. Foster and others have incorporated the Montana and Cœur d'Alene R. R. Co. with a capital stock of \$1,000,000.

The plans for the construction of the pontoon bridge, 680 feet in length, were made recently by E. H. Bramhall, of Camden, N. J., and sent to Curacao, W. I. Mr. Bramhall has been notified of the acceptance of his plans and requested to make figures, which he has done. The bridge would require seventeen boats, strongly built and copper fastened, and would cost from \$20,000 to \$25,000.

A new electric railway company has been organized to put in a street-railway in South St. Paul, under patents of the Enos Electric Railway Supply Co. Incorporators: Arthur E. Clark, Charles W. Clark, Thomas T. Smith, James W. Imeson, Daniel D. Merrill, Albert M. Lawton, Charles H. Lienau, George H. Staples, and Norman T. Bryant, all of St. Paul. The capital stock is fixed at \$500,000 and the principal place of business is St. Paul.

KINGSTON, N. Y.—A meeting of the directors of the Delaware and Otsego Railroad Company was held here. Thomas Cornell, of this city, was elected President; Samuel W. Andrews, of New York, Vice-President; Samuel G. Dimmick, of Kingston, Secretary and Treasurer. The building of the road will be begun at once.

PITTSBURG, PA.—The Pennsylvania railroad contemplates building a bridge across the Ohio River, at Nimick Station, four miles below Pittsburgh.

MISCELLANEOUS.

CHICAGO, ILL.—Commissioner of Public Works George B. Swift asks bids until June 8 for a quantity of granite and cedar blocks.

MILWAUKEE.—A 6-hatch crane for discharging ore at the Rolling Mill dock, in Bay View, will be built. North Chicago Rolling Mill Company, Milwaukee, Wis., are the owners. A \$25,000 public bath-house will be built.

OTTAWA, CAN.—A delegation from the Toronto City Council, consisting of Alderman Boustead, Chairman of the Executive Committee, and Alderman Baxter, arrived in the city May 26. The object of their mission is to interview the Government in relation to the commencement of the harbor improvements and the erection of a new drill shed in that city. The corporation is willing to contribute \$100,000, which is half of the estimated cost of the former work, and to provide a site for a new drill hall.

MINOT, DAK.—An extensive mica bed has been discovered seven miles from this place.

MONTGOMERY, ALA.—Work was begun on an iron furnace at Riverside, a suburb of Montgomery. It is the first furnace and the only one being erected in the Black belt of Alabama. The corner-stone of the furnace will be laid on July 4.

MESSRS. MORRISON & MASON, of Glasgow, have been awarded the contract at £129,973 3s. and 6d. for constructing the first portion of the new water-supply scheme for Manchester, England, which involves the tapping of Lake Thirlmere. A large amount of tunnel-work is also to be done in connection with this scheme.

CLEVELAND, O.—The Cleveland Hydraulic Dredging Company, capital stock, \$50,000, has been incorporated by P. W. Rice, Fred Hempy, W. P. Cowan, B. F. Morse, and Frank Rieley.

SAVANNAH, GEO.—Clifton Manufacturing Company will build an additional cotton mill at a cost of \$300,000.

TUCSON, ARIZ.—A water ditch, to cost \$20,000, will be constructed here.

INCORPORATED is the Henry Martin Brick Manufacturing Company, of Lancaster, Pa. Capital, \$150,000.

TACOMA, WASH. TERR.—Plans are now being prepared at Washington for the new light station at Destruction Island, for which an appropriation has already been made by Congress. Destruction Island is situated on the northern coast line, about midway between Gray's Harbor and Cape Flattery. This new light-house will cost about \$85,000. Attached to the station will be a fog signal. The main tower, which will consist of iron, will be 85 feet high. Bids for the contract to construct this station will be advertised for by Captain Powell, the construction engineer, before long. It will be a first-order light.

BIDS OPENED.

BOSTON.—The following proposals were received May 26 for the mason-work of the Horace Mann school-house, to be located on Newbury Street: Abraham Ripley, \$38,887; R. R. Mayers & Co., \$37,488; J. H. Coon & Co., \$38,100; Donahue Bros., \$41,000; D. H. Cram, \$30,990; Edward Lynch, \$39,500. The contract was not awarded, as the proposals were all in excess of the appropriation.

MOHAWK, N. Y.—Two extensive contracts have just been awarded to Messrs. Brown Brothers, of Mohawk, one at Cohoes, from Cohoes Water Company, amounting to \$60,000, for masonry and earth-works in extending and repairing canal No. 3, and one for dredging at Covines Folly, Hudson River.

MINNEAPOLIS.—The following bids were received by the Board of Education last week

for additions to the high school: L. C. Bisbie, \$47,895; J. R. Quigley, \$43,985; F. A. Fisher & Co., \$43,622; A. Dinsmore & Co., \$43,150; H. E. Selden, \$43,000; R. McMillan & Co., \$42,850; Haglin & Morse, \$41,796; H. N. Leighton & Co., \$37,200. The contract was awarded to the lowest bidder, H. N. Leighton & Co.

PHILADELPHIA.—The lowest bid for lining the East Park Basin was that of the American Artificial Stone Paving Company, which amounted to \$65,277.74. The Vulcanite Pavement Company's bid for cement covered with Neuchatel asphalt was \$68,364.75, which Dr. Gilbert was willing to guarantee to be waterproof for at least three years.

LITCHFIELD, CONN.—The contract for the construction of the new Mansion House block has been let to J. N. Robertson and Francis P. Rice, of Danbury, for \$22,000.

WALDEN, N. Y.—The contract for building a two-span bridge at this place has been awarded to the Iron Bridge Co., of East Berlin, Conn., for \$13,900.

CINCINNATI.—Contract for paving Baymiller Street awarded to G. Eyermann & Co., at \$97,806.72.

ALBANY, N. Y.—Superintendent of Public Works Shanahan has awarded the contract for dredging 30,000 cubic yards of material from the river at Round Shoals and 1,000 cubic yards at the upper railroad bridge to John Brown, of Mohawk, for 22½ cents per cubic yard. The other bids were: Round Shoals—P. W. Myers, 44.7, and E. M. Payne, 43.9 cents; and the railroad bridge, E. M. Payne, 43½, and Robert Jones, of Cohoes, 48½ cents per cubic yard.

TOPEKA, KAN.—The following are the bids submitted to the Board of Regents of the State Normal School for erecting the new wing to the present building: L. D. Eversole, Topeka, \$24,536; John Hammond, Emporia, \$20,245; J. M. Anderson, Emporia, \$21,850; E. F. Sprague, Emporia, \$24,835. The contract was awarded to John Hammond.

Following are the bids for the plumbing, heating apparatus, etc.: Griffith & Ewing, Emporia, \$4,708; D. C. McMurtrie, Emporia, \$4,500; M. E. Herbert, St. Joseph, \$5,000; S. I. Pope & Co., Chicago, \$4,898; Sheehan & Jacobs, Topeka, \$4,300; McCarthy & Sheehan, Topeka, \$4,485. The contract was awarded to Sheehan & Jacobs, of Topeka.

The work of construction will commence at once and be prosecuted to final completion.

WASHINGTON.—The contract for completing the terrace and grand stairways at the Capitol was awarded to the Vermont Marble Company for \$123,700.

AMSTERDAM, N. Y.—The contract for fifteen miles of sewers was let as follows: Benjamin Van Vranken, Schenectady, section two; Stanton & Doyle, Cohoes, section three; Brown & Buckley, Mohawk, section four; Sherman & McDonough, West Troy, sections five and six. Charles A. Miller & Son, Utica, contract for material for five miles at \$34,126.74. Work will be begun at once.

DETROIT, MICH.—Bids for paving Beaubien Street, from Jefferson Avenue to Congress Street, with cedar blocks and stone gutters, were opened yesterday by the Board of Public Works, as follows: Eugene Robinson, with Berea stone curbing, \$1,481.54; with Medina stone curbing, \$1,629. S. R. Thompson, with Berea stone, \$1,760.77; with Medina stone, \$1,849.78. Leadbeter & Stewart, with Berea stone, \$1,657.87; with Medina stone, \$1,786.44. H. Brossard, with Berea stone, \$1,755.46; with Medina stone, \$1,824.69. Talbot Paving Company, with Berea stone, \$1,938.34; with Medina stone, \$2,037.22. H. Meridian, with Berea stone, \$1,490.77; with Medina stone, \$1,819.36.

Bids for paving Cherry Street from Fourth to Trumbull Avenue: Leadbeter & Stewart, with Berea stone, \$8,455.01; with Medina stone, \$8,941.47. S. R. Thompson, with Berea stone, \$8,735.79; with Medina stone, \$9,030.19. Talbot Paving Company, with Berea stone, \$9,078.63; with Medina stone, \$9,450.52. H. Meridian, with Berea stone, \$8,857.12; with Medina stone, \$9,335.75. Eugene Robinson, with Berea stone, \$8,571.24; with Medina stone, \$9,154.64.

Bids for furnishing the District Government one portable 4-inch pumping plant, including engine and boiler complete, ready for use opened May 18: Joseph Edwards & Co., 414 Water Street, N. Y., \$935; S. C. Forsaith Machine Co., Manchester, N. H., \$827.50; Lawrence Machine Co., Boston, Mass., \$1,425.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 2. } PUBLISHED EVERY SATURDAY.

NEW YORK, JUNE 11, 1887.

LONDON, JUNE 25, 1887.

ROCHESTER ENJOINED FROM DISPOSING OF ITS SEWAGE TO DETRIMENT OF A NEIGHBOR.

THE Court of Appeals of this State has just rendered an important decision in reference to the powers of a town in the matter of the disposal of its sewage.

The city of Rochester discharged its sewage into an open drain which it had constructed across lands situated within the adjoining town of Brighton, and in such wise as to create a nuisance. The town Board of Health thereupon issued an order prohibiting this use of the open drain, but having no power to go within the limits of the city of Rochester and abate the nuisance by preventing the discharge of the sewage, it brought suit in court against the city for an injunction restraining the discharge of the sewage into the open drain without its own limits and within the boundaries of the adjoining town of Brighton. The Court granted the injunction, and upon ultimate appeal to the Court of Appeals the action of the Court below has been sustained.

This seems to be an eminently just decision. One town or city ought not to perfect its own system of sewerage to the detriment of its neighbor.

THE NEWARK IMPROVED SEWERAGE.

WE recently devoted considerable space to illustrate and describe the recent work in connection with the improved sewerage system of Newark, N. J. It seems timely, therefore, to remind the authorities of that city who look for relief from the almost unbearable nuisance caused by the deposit of sewage on the meadows, from which it has suffered so long, that the new structure has been designed as the first step of a comprehensive system which must be carefully followed and developed as the city grows in size, and to call attention to the necessity of making all the features of the new settlement, which, it is expected, will steadily advance on the meadow, conform to the requirements of the new sewerage system.

We regret to hear that no active steps have been taken by the city government to regulate the grade of the streets adjoining the meadows, when it is obvious that the ultimate success of the improved sewerage system depends to a large extent on proper grading of that district.

The necessity of a perfect adaptation of the street-grading to the system of sewers is shown in the following extract from the report of Mr. A. Fteley, the Consulting Engineer, who recommended the new sewer (July, 1884):

The system which has just been submitted to you provides a way for the disposal of the sewage for the present and for the future, but its success is contingent upon the following conditions:

First—The present street sewers must be properly connected, as they are built, with the collecting sewers.

Second—The grading of the streets must be done in such a manner as to accommodate the sewerage system.

The first point need not be developed.

The second may require some explanation.

Some parts of the built parts of the city in the vicinity of the meadows, either on solid ground or on filling, are now too low. The flow in the sewer is not satisfactory and the water stands in the ground too near the surface. This condition of things is universally admitted as the cause of disease and may work against the success of the drainage system at those points. The grades of the streets in parts

now settled upon near the meadows (wherever practicable) and in the new portions to be filled up should be fixed beyond question.

The elevation of the proposed grading cannot be finally fixed until a careful study has been made of the system of sewers to be built in connection with the proposed collecting system, but the elevation of the surface should not be less than seven or eight feet above high-water mark; no less an elevation, it is thought, would be recommended by your sanitary advisers.

Whatever be the decision of your City Council in regard to the sewer system now recommended, the question of a perfect adaptation of the street-grading to the system of sewers is of such consequence that I would suggest as an important part of the recommendations which you expect from me, that a study should be made of it, in order to enable you to regulate the further advance of the settlement of the city on a fixed basis. Without giving in detail the final arrangement of the sewers through the streets which must be drained in the near future, it may be said that the same mode of disposing of sewage as is now proposed for the existing sewers may be adopted; or it may be found preferable, in order to reduce the height of filling, to resort to a double system—viz., one system of drain-pipes directly connecting the houses with the collecting sewer, and one system of surface sewers, with small inclinations, to be connected with the meadows or with the storm-sewer when the time comes to build it.

These recommendations should be followed, otherwise, when too late, the city will find it has lost a large part of the advantages the construction of the improved sewerage would have secured.

FOOD PRODUCTS IN NEW YORK.

AT a time when daily newspaper enterprise is largely directed to secure articles for publication that are alarming and sensational in their character, it is a matter worthy of commendation that the New York *World* has been at considerable expense to place before its readers a reliable and authoritative report of the condition of food products in this city, with reference to the character and extent of their adulteration. Instead of going about the matter so as to be able to publish sensational articles such as filled the daily papers a few years ago when we were active in promoting legislation to check the evil, the *World* employed Dr. Edward G. Love, late Analyst of the New York State Board of Health, who is specially qualified for a work of this character, to undertake the examination of a large number of samples, all of which were secured in such a way as to fairly indicate the character of the groceries sold in the tenement districts of this city. The first installment of Dr. Love's report appears in the *World* of June 5, and gives the particulars of several hundred samples, in each case stating from whom the sample was bought. We advise Health Boards and all persons interested in these matters to procure copies of the *World*, as these reports will be a valuable contribution to the literature on this subject. It is gratifying to note, as the *World* says, that "the grocers of this city are really dealing honestly with their customers, and that the number of instances in which adulterations have been detected is comparatively few, and of the false weights fewer still." The adulterations that were found to exist were mainly such as affect the pocket and not the health, and this, as our readers will remember, is in accord with the results of previous

examinations of the food-supplies of this State by competent men and with the position taken by this journal on the character of food-adulteration.

OUR BRITISH CORRESPONDENCE.

A Large Blast—Filthy Condition of River Logan—Ransome Paper on Timber Cutting in United States.

LONDON, May 25, 1887.

AN unusually big quarry-blast, stated to be the greatest piece of rock-blasting ever yet undertaken in England, was successfully accomplished on Saturday last at the Llanberis Quarries in the neighborhood of Snowdon. Between two workings of the quarry was a mass of rock endangering the lives of the men in the event of further excavations. This mass of rock was estimated at 100,000 tons, and the method of removal was as follows: Within the past two years a tunnel, 118 feet long, has been driven into the base of the rock. This tunnel branched out into six chambers, each terminated by a shaft, and into these shafts explosive

Mr. L. H. Ransome, Inst. C. E., has just read a paper before the institution on the "Conversion of Timber in the pine-growing districts of the United States by circular and band saws," giving therein conclusions arrived at from the study of the subject during a recent visit to the States. Summing up on the question of economy in results, he gives the palm to the band-saw, stating that with a 1-inch board the band will waste $\frac{1}{8}$ -inch per cut—that is to say, 120 per cent.—as against $\frac{1}{4}$ -inch by a circular saw, or 240 per cent. In a $\frac{3}{4}$ -inch board, planed, he states, it is necessary to allow only $\frac{1}{8}$ -inch on each side, as against $\frac{1}{4}$ -inch for the same work with the circular saw. He allows that at the present time the circular saw will show generally the best results, but points out that this fact is determined principally by the incomplete state of the works where band-saws are usually employed. These results, of course, are quoted on the most improved forms of band-saws.

SAFETY-VALVE.

A HOUSE AT LONGWOOD, MASS.—S. E. TOBEY, ARCHITECT.

gelatine was packed. Thirty-six hundredweight of gelatine, estimated as the equivalent of nineteen tons of powder, was used. The fuse to fire the charges was arranged for collective and instantaneous operation. Twenty minutes after firing the fuse there was an outburst of stones and earth, but very little report. The operation was perfectly satisfactory, the force of the gelatine being expended on the interior of the rock base, bringing the general mass down into the workings for removal.

I referred some months since to the state of the River Logan, which runs through the heart of Belfast, in the summer months, owing to the presence of sewage. At this period of the year, when the stream is stirred up by the screws of the steamers, there is undoubtedly a stench and nuisance. I see, however, that works have just been put in hand for the sewerage of the Ballynafeigh and Ravenhill districts of Belfast, and that it is intended to carry the sewage into the Logan. This sewage has formerly been run on to some marshy ground, but the fact that it is ponded there is no justification to diverting it into an already surcharged stream.

OUR SPECIAL ILLUSTRATION.

A MANTEL in the Tiffany House, New York, from designs by Mr. Louis C. Tiffany.

OUR VIGNETTE ILLUSTRATION.

THE subject of our vignette illustration this week is the residence of Mr. George Dexter at Longwood, Mass. The first story is clap-boarded and the second story, porch, and terrace shingled. Both the interior and exterior have been stained a variety of tints, the Dexter Brothers' stains being used for that purpose. The cost was \$7,600, and the architect was Mr. S. Edwin Tobey, of Boston.

THE PRESERVATION OF WOOD.

PROFESSOR A. H. CHURCH, in a recent lecture on "Wood, Its Chemistry, Its Decay, and Its Preservation," thus alludes to the use of paraffine as a preservative of wood: "It was now believed that wood did not decay simply by the action of moisture and air, unless the germs of living beings were also present, and that was the reason

why the three classes of materials which prevented decay had been found to be effective. Some of these agents altogether excluded air and water, and were termed hydrofuge substances. A coating of excessively hard paraffine, melting at a temperature of 150° Fah., excluded all the germs of those minute organisms, and prevented decay. Paraffine was absolutely indestructible, and was unaffected by alterations of temperature or exposure, consequently it offered one of the best materials for the treatment of wood in cabinet or joinery work; and although it slightly increased the inflammability of the material for floors and parquetry, nothing was better than paraffine." He then mentioned substances which prevented the decay of timber which he termed of the poisonous class. "Air and moisture might be permitted to penetrate the wood, but by putting minute quantities of chloride of mercury, carbolic acid, acridine, cryptidine, or naphthaline into it, the timber

would show no alteration, except that the coloring matter was changed, until the preservative substance had escaped. Then there were substances which were non-poisonous, and not hydrofuges, but which yet prevented decay and paralyzed the organisms. A small quantity of the vapor of chloroform, and many other substances, were, without being actually poisonous, able for a time to prevent the decay of wood. On all grounds, therefore, they arrived at the conclusion that timber decayed on account of the presence of living organisms, and not by direct chemical action."

THE water-supply of the various European capital affords some interesting facts, not the least notable of which is that Rome heads the list with her 204,000,000 litres of pure water—a litre being a little more than one and three-fourths pints—every twenty-four hours, and, as her population is 345,036, every inhabitant can thus dispose of nearly 600 litres per day. London comes next, for every one of whose population of rising 4,000,000 there are 300 litres daily. Paris takes the third place, her population amounting to 2,240,124 and each inhabitant having for alimentary purposes 58 litres per day, and for secondary uses 169, or a total of 227. Berlin has 1,302,283 inhabitants, for each of whom there are 140 litres daily; Vienna, 770,172 inhabitants, with 100 litres each per day; Naples, 463,172, with 200 litres, and Turin, 278,598, with 90 litres a head every twenty-four hours.—N. Y. Sun.

THE SANITARY ENGINEER & CONSTRUCTION RECORD ILLUSTRATED SERIES.

A MANTEL IN THE TIFFANY HOUSE, NEW YORK.

DESIGNED BY LOUIS C. TIFFANY.

THE CHILDREN'S HOSPITAL, WALNUT HILLS, CINCINNATI.

THE Children's Hospital, as shown, is in reality two buildings, the administration block proper being in the front, and containing reception-room, day-room for the children, kitchen, general dining-rooms, officers' dining-room, sleeping apartments for the nurses, operating-room, etc.; the building in the rear being divided on each side of the central corridor into male and female wards. This was found necessary, as the children who are received and kept at this hospital range in age from that of mere infants to fifteen or sixteen years old, and the division into male and female wards was found necessary on that account.

In connection with the wards are private rooms for the most serious cases, also bath-rooms, linen-closets, water-closets, etc.; the water-closets in every case being put in semi-detached wings.

Attention is called to the fact that the wards or hospital building proper is separated from the administration block by an open corridor. These are so arranged that they can be enclosed with sash if thought necessary, but it is the intention of the managers at present to leave them entirely open, thus having free passage of air between the two buildings. At the same time the corridor is covered over and protected from the weather by a roof.

In the third story over the wards is placed a "suspect" ward or ward, for contagious diseases, this being kept entirely from the wards below and being only accessible from the third floor of the administration block.

The building is to be heated by steam, and the coils are placed under the windows in the wards and the stool of

the window is made to extend back and cover over the top of the coil. This gives a marble capping to each coil. Air is admitted to these coils through an opening under the sill and the draught is regulated by a valve worked from the inside. Above and below each bed is placed a wall register connected with a flue in the wall, this being carried up to roof-loft and conducted through tight metal pipes to the central cupola in the middle of the ward building, where a Blackman fan is placed to assure mechanical ventilation at all times. The speed of the fan will be regulated so as to remove air without creating any great draughts.

In the interior finish of the building the aim has been to keep everything as smooth and neat and clean as possible, so there will be no chance for lodgment of dirt, the walls being finished with cement wainscoting and all the angles rounded so as to have everything accessible. The jambs between the windows are plastered and no heavy wooden casings are used in any place.

The material of the building is dark red common brick laid up in the usual manner and trimmings of Ohio free-stone.

The roof is of slate. The walls of the ward portions are built hollow, but the walls of the administration block are built in the ordinary manner, being solid walls.

In connection with administration block is a day-room or convalescent-room for children, and connecting with this is a wide piazza where they may take out-door exercise.

The buildings are also surrounded by spacious grounds and finely-kept lawns, and being elevated high above the city and out of the way of the prevailing smoke wave, the children will be provided with plenty of fresh air and sunshine.

There is also a class of patients which will be treated by the physicians of this hospital, but which are not received within the walls of the hospital itself. These, known as out-door patients, are received and treated in the office in the basement of the administration block. The laundry will be in a separate building.

The architects are Samuel Hannaford & Sons, of Cincinnati.

THE NEW CROTON AQUEDUCT.

No. XIII.

(Continued from page 234, Vol. XV.)

DISK FOR MEASURING CROSS-SECTIONS IN TUNNELS.

THE ordinary practice of measuring the sections of a tunnel is often slow and tedious, particularly so when it is necessary to repeat them every ten feet or less, in a tunnel having a large sectional area; but to reduce this labor to a minimum, the disk-measure was designed for the New Croton Aqueduct, where it is generally known as the "Sunflower." It is also useful for testing masonry work after centres are struck, to note if any settlement or distortion has taken place.

This instrument consists of a disk firmly secured to cross-pieces of wood, supported by braces *c*, which are riveted to tube *d*. This tube, when placed in position on tripod-head, can be moved vertically, and secured to any height desired by clamp-screw *A*. The disk *a*, and cross-pieces *b*, and "indicating-arm" *e*, are made of wood, but all other parts are brass.

Figure 1 is a vertical section through the "sunflower," *a* being the disk which is $\frac{1}{4}$ of an inch thick and 14 inches in diameter, firmly secured to cross-pieces *b*, which are $2\frac{1}{4}$ inches wide and $\frac{1}{4}$ of an inch in thickness. Figure 3 represents back of disk and frame, and to the latter a circular band, *g*, is fastened with screws. This band is $\frac{1}{4}$ of

SECOND FLOOR PLAN

FIRST FLOOR PLAN

(CHILDREN'S HOSPITAL

WALNUT HILLS,

CINCINNATI, OHIO.

BASEMENT PLAN

an inch thick and $\frac{3}{4}$ of an inch wide. The vertical and horizontal braces *c*, in Figs. 1 and 4, are secured to this band at *i* in Fig. 3. The space between disk and vertical tube *d*, to which the braces are riveted, is $2\frac{5}{8}$ inches. This tube is $\frac{3}{4}$ of an inch in diameter and three feet long. The face of disk shown in Fig. 2 is graduated into degrees, from 0° to 180°. Bearing-plates are inserted on face and back of disk at axis shown by black lines at *k*, Fig. 4.

Figure 4 is a horizontal section on an enlarged scale of *a*, *b*, and braces *c*, with form of connecting latter with tube *d* at *h*. In Fig. 2 the dotted lines show relative position of "indicating-arm," which is represented on plan at *e*, Fig. 1, detached from section. At each end of this "arm" brass plates project to aid in guiding the rod used in measuring distance from axis of disk to perimeter of tunnel section. A vernier is marked on "indicating-arm" for reading distances less than half a tenth when desired for testing masonry work.

At axis of "indicating-arm" *r*, a solid piece of metal is firmly secured to "indicator," and extends through to back of disk, where it is held in position by spring *s* and a capstan-headed nut. This "indicator" is raised $\frac{1}{8}$ -inch from disk by a shoulder, permitting it to revolve freely. In Fig. 3, *s* is a plan of spring and capstan-headed nut. At *f*, Fig. 1, a longitudinal section of "sight-tube" is shown, which consists of a plain tube with a small hole at *f* in eye-piece, and vertical and horizontal cross-wires at *j*. Over this sighting-tube the leveling-bubbles are placed at *l*, and in plan on Fig. 6. Under the sighting-tube can be seen clamp-screw A, which is movable on the tube *d*. When sunflower is set in position this clamp rests on the tripod-head, and the disk can be raised or depressed to any desired height.

Clamp B is shown on the enlarged section of tripod-head, Fig. 5. The black lines at *m m* represent a detached piece of metal, which is in horizontal section about $\frac{1}{8}$ -inch less than a complete circle, thereby permitting clamp B to

secure the tube *d* in a firm position when the disk is set on centre axis of the tunnel in position for measuring sections. The ball and socket joint is also shown in Fig. 5.

Figure 6 is a section of a quick-leveling socket and a plan of the leveling bubbles.

This socket is a tube 5 inches long, closed at lower end except a small hole which is to allow a cord to be passed through to which a plumb-bob can be attached. Figure 7 is a plan of a protractor made expressly for this work. It is 3 inches in diameter, with a centre-piece of mica, from which an arm about 10 inches long projects, graduated to a scale of 20 feet to 1 inch, the same scale as section-sheet in Fig. 8 is made. The four black points on face of protractor indicate position of pins projecting from lower side, which are pressed into the paper when plotting, holding it firm in position. This arm revolves freely around centre-piece to any desired angle.

Two measuring-rods are furnished, made of pine, one being 8 feet and the other 14 feet long, 1 inch wide and $1\frac{3}{8}$ inches in depth, made tapering in depth only from centre to $\frac{1}{8}$ of an inch at one end to lessen weight, having a metal shoe on taper end to prevent injury when pressed against rock face of tunnel. The rods are divided in feet and tenths.

Directions for using Sunflower.

The centre line of tunnel is not preserved on the floor, where constant travel would disturb it, but by drilling holes in the roof about 50 feet apart. Into these holes pine plugs $1\frac{1}{2}$ inches in diameter and 4 inches long are driven; and into this plug a horse-shoe nail

with head flattened and having a centered eyelet is inserted. Through this eyelet telegraph wire is suspended from two plugs, and kept in position by weights of about 25 pounds each (a stone will do). A wire can then be stretched between these two points, which will produce a line close enough for rock sections. Over this horizontal wire a tripod which has extension legs, is set with disk detached. The tripod is then made plumb and leveled, by inserting quick-leveling socket shown in Fig. 6. When this operation is completed, the leveling-socket is removed, and tube *d* is placed in position in tripod head, and the disk raised to the required elevation by sighting through sight-tube to a leveling-rod held on bench, and then fixed firm in elevation by clamp-screw A.

The sight-tube is then turned in the direction of the vertical wire in advance of the instrument, which can be readily seen by use of a lamp for that purpose, and fixed

in position by clamp-screw B. The disk will then be on centre line, and in position at right angles with central axis of tunnel. When more accuracy is desired, the line can be given with a transit. The sunflower is now ready for taking sections. The "indicating-arm" is set at 0°, and measuring-rod previously described, resting on indicator is extended to perimeter of section, and distance recorded; then indicator is moved to next angle; distance and angle recorded, this operation being repeated from 0° to 180°, when the rod is reversed and opposite half of section measured in same manner. A copy of a field record is shown in Table II., and plotting of the field notes illustrated in Fig. 8.

Table I. is the form used in field books for recording location of plugs driven in roof of tunnel for alignment. First column is station; second, number of plug; third, elevation; fourth, roof grade, which is twelve inches above intrado of arch; fifth and sixth columns, the height of plug above or below this grade; seventh, name of person setting plug; eighth, the date; ninth, distance from centered line.

Table II. represents a record of notes taken for rock excavation measured at two sections in the tunnel, with date and station of cross-section. The first and second columns, give angle and distance from centre of disk to perimeter of cross-section on east side; the second and third columns, a similar record for the west half of cross-section. Left and right, can be used in place of east and west, to designate division of cross-section; but the latter is preferred, as it eliminates any doubt of the direction a field party may have been working when taking the cross-sections, as the axis of the tunnel extends in a northerly and southerly direction. The note below table, "Axis 2.2 below spring," indicates elevation of the centre of disk when the cross-sections were taken. The area of cross-section can be correctly measured, by setting the sunflower at any point within the plane of the cross-section. Some engineers prefer to set centre of disk at a uniform elevation above or below spring-line to give uniformity of working-line, as ordinates can be calculated, giving distance to perimeter of section, a reference to which at time of taking cross-section will determine if excavation has conformed to the section required.

..	180	4.8

Axis 2.2 below spring of arch.

Axis 2.4 below spring of arch.

Figures 8 and 9 represent the notes recorded in Table II., plotted to facilitate a correct computation of the areas. The form of printed sheets used for that purpose is given in Fig. 8, with angle of each measurement computed from the notes given in Table II. All sheets for this purpose are printed on a scale of 20 feet to one inch, the same scale as the arm of the protractor used for plotting, which has been previously described. The axis from spring-line is first marked on a sheet, then centre of protractor put in position over it, and pressed firmly down, which will project the pins through the paper and keep it in position, permitting arm which revolves around centre to be moved

quickly to any point desired for plotting notes of cross-sections.

In Table III. the field notes plotted on Fig. 8 are arranged for computing, the number of shaft, heading station, and date of measurement being recorded. It is separated in two divisions, one for the east and the other for the west half of the section. The first column contains the numbers which designate angle taken, and second the factors required to compute the area of a triangle, which are the length of two sides and the included angle; the third column logarithm of the factors, and fourth, the area. The westerly half is calculated in a similar manner; the amount of the two added together, and divided by 2, will give area of whole section. To diminish the labor of taking off the logarithms, two tables are prepared on separate sheets, one containing copy of the logarithms of numbers from 1 to 20.9 advancing by tenths, and the other logarithmic sines from one to sixty degrees advancing by single degrees. *The sheets in size are 8x10 inches. The sheet to contain logarithm of numbers is divided into twelve columns, the ten intermediate columns being headed by the numerals 1 to 10, the first and last containing decimals 1 to 10, and ten columns between containing the logarithms. The sheet is separated into two parts, permitting the logarithms from 11 to 20 to be entered on the lower half.

			2)382.207				
			Total Area, 191.103				

On the other sheet is copied the logarithmic sines from one to sixty degrees. This is divided into eight columns, with angle and sine placed in alternate columns. If the field notes are carefully plotted on the section sheets, the area can be computed quickly with a planimeter, and the variation from the correct area will be less than two-tenths for the whole section. The time required to measure a section of the tunnel with the "sunflower" is from six to ten minutes. It was designed by Alfred Craven, a division engineer on the aqueduct. The weight of the disk, including all attachments, is ten pounds, and the tripod-head, with tripod, having extension legs, 10 1/4 pounds, making a total weight of 20 1/4 pounds. It is manufactured by Heller & Brightly, of Philadelphia, for \$69.50, which includes the two measuring-rods. The protractor is made in New York by Guardam & Sons.

THE COMPARATIVE VALUE OF STEAM AND HOT WATER FOR TRANSMITTING HEAT AND POWER.*

THE relative value of steam, water, or other vehicle for the purpose of distributing heat to be used for heating and power purposes, curiously involves, in a large degree, the same elements as the transportation of passengers and freight on railroads. With the latter, the relative amount of paying and non-paying load forms one of the most important considerations, while with the former the relative values depend largely upon the percentages of their heat-carrying capacities which can be utilized in practice. In generating steam with fuel, the gases may be reduced in temperature nearly to that of the steam itself, securing fair efficiency, but in melting metals, they must be rejected at a temperature higher than that of the metal, and economy secured by secondary operations to save waste heat. Similarly the efficiency of the heat transmitting medium depends upon the amount of heat rejected or unavailable by the conditions of the problem compared with that originally imparted to such medium.

If steam and hot water of 400 degrees temperature be respectively used for some heating purpose, such as cooking, requiring nearly that temperature, the steam will give up its latent heat and be converted into a small quantity of water at the final temperature, while hot water can only give up its sensible heat represented practically by the difference between its original and final temperature. If the fall of temperature be from 400 to 399 degrees, the water would impart substantially one thermal unit for each pound of water circulated over the surface, while the steam would impart over 800 thermal units for each pound of water condensed. If a difference of 2 degrees were allowed, the water would impart substantially two thermal units for each pound of water circulated, whereas the heat supplied by the condensation of one pound of steam with same limits of temperature would be but slightly reduced, though the relative quantity of water required to be circulated to equal the results obtained with one pound of steam would be reduced one-half. By allowing a still greater reduction of temperature the water would appear at less disadvantage. For instance, with a difference of temperature of about 11.15 degrees the water would impart 11 1/2 thermal units for each pound of water circulated and the steam 842 thermal units for each pound condensed.† This is doubtless a greater reduction of temperature than could be allowed for cooking, and yet it would require (842.04 ÷ 11.52 =) 72.71 times as much water circulated to do the same work as would be required if steam were used. In this case, then, 72.71 pounds of water would necessarily be heated at the station, pumped to the point where the heat was required and then be forced back again to the station at a lower pressure and pumped into the boiler to be reheated, for each pound of water evaporated if steam were used as the medium of transmission. The steam would be transmitted by causing a slight difference of pressure from the heating station to the point where it was used, and its surplus pressure would return the water of condensation back to the station, where one pound would require to be pumped in the boiler for each 72.71 pounds by the water system.

As the temperature at which the heat is to be applied is reduced, the preponderance against the water system somewhat diminishes. For instance, if steam at 70 pounds pressure be required to operate engines, it may be obtained by directly expanding down the steam of 235 pounds pressure, which would result in a beneficial superheating of 25.87 thermal units per pound of steam thus expanded. If, however, the steam were supplied from hot water at 400.89 degrees temperature, corresponding to the pressure of 235 pounds, only 10.2 parts in 100 would, on reducing the pressure to 70 pounds, flash into steam at that pressure, so in that case 10.2 pounds of water would necessarily be heated at the central station, transmitted to the point where steam is required, and if high-pressure engines were used, 9.1 pounds would necessarily be transmitted back again, and finally 10.1 pounds pumped in the boiler for each pound weight of steam used, instead of the one pound which would be required to be evaporated at the central station in the case of the steam plant.‡

For heating purposes, the temperature could, under favorable circumstances, be reduced to 228 degrees in the coils, corresponding to a pressure of five pounds, in which case, without repeating the operations above described, there would require to be circulated from the heating station to the point of supply and back to such station, 5.69 pounds of water for each pound of steam utilized at the point of supply, or for the heat which would be imparted

* Paper read at meeting of American Society of Mechanical Engineers, at Washington, meeting June, 1887, by Charles E. Emery, of New York City.

† (A) Temperature due to 235 lbs. gauge or 200 lbs. absolute pressure, 400.89; temperature due to 205 lbs. gauge or 200 lbs. absolute, 389.74—difference, 11.15°. Total heat above 32° in the two cases, respectively, 373.75 and 362.17—difference, 11.5 thermal or heat-units. Total heat steam of 235 lbs. gauge pressure, 1,204.21 heat-units. Subtract 362.17 heat-units due to final temperature, gives 842.04 heat-units available from condensation of steam between limits of temperature stated.

‡ (B) Total heat steam of 70 lbs. gauge or 85 absolute pressure, 1,178.34 heat-units, which subtracted from 1,204.21 heat-units due to 235 lbs., foot-note (A), shows 25.87 heat-units for superheating. Temperature due to 70 lbs. gauge 316.08, corresponding to 286.26 heat-units above 32°, which subtracted from 373.75 heat-units due to 235 lbs. (A) leaves 87.49 heat-units available for making steam with water, and subtracting same from 1,178.34 heat-units, total heat due to 70 lbs., gives 892.08 heat units required for steam of 70 lbs. Hence there will be required 892.08 ÷ 87.49 = 10.2 pounds of water circulated per pound of water evaporated into steam of 70 lbs. pressure.

at the temperature corresponding to such pressure, for each pound of steam which in a steam system would be evaporated and sent direct from the station.*

The above statements may be easily verified from the figures given in the foot notes, and the great resistances found in pumping water through pipes at high velocities being well known, there would seem to be no reason why any one should think of using water rather than steam for the purposes above referred to. The subject, has, however, been agitated for a number of years. Little plants to show what could be done with water heated to a high temperature have been built from time to time, but apparently did not command the capital necessary to start the business on a large scale. Another revival has recently been attempted, however, based chiefly on the favorable report of an unusually well-informed engineer of experience and acknowledged ability, to whom it is a pleasure to say the writer is personally indebted for many valuable suggestions as to proper courses of study at an earlier period of life. Mr. Isherwood, in forming his opinions, has evidently, however, failed to consider some of the most important elements of the problem, and occasion is thereby made for an abstract discussion on the merits of steam and hot water, so far as possible, without reference to the merits of a particular system and the details of the same.

It has been stated in the public press, quoting from the report, that a cubic foot of water at 400 degrees temperature contains $34\frac{1}{2}$ times as much heat as is contained in a cubic foot of steam at the same temperature, and it is therefore concluded that "the areas of the pipes will be in this proportion, making their diameters in the proportion of 1 for the water and $(\sqrt{34\frac{1}{2}}) = 5.89$ for the steam." Also that "the thickness of the material of the pipes for equal strength would have to be about six times greater for the larger steam-pipe than for the smaller water-pipe, even if both were lap-welded." On the supposition that larger steam-pipes would be necessary, comparisons were presented of the "greater bulk," "enormously greater cost," "extra loss of heat by conduction and radiation" due to the larger pipes, with some further remarks about the difficulty of getting rid of the water of condensation in steam-pipes, difficulties of management, etc., not at all warranted by the state of the art in relation to steam plants. Evidently the error behind these statements is to be found in the assumption that because a given quantity of water of the temperature assumed contains $34\frac{1}{2}$ times as much heat as that of an equal volume of steam, therefore the steam-pipe must be proportionally larger to that extent. It ignores entirely well-known laws of hydraulics, which teach that a fluid of much less density than another will, with the same difference of pressure, flow at a much higher velocity. The weight of a fluid transmitted through pipes with comparatively small distances of pressure at opposite ends, is proportioned to the square root of the 5th power of the diameter of the pipe, into the square root of the pressure gradient (represented by the difference of pressure between the two points divided by the length) into the square root of the weight per unit of volume of the fluid, for instance, the weight per cubic foot, called by Weisbach the "heaviness" and herein designated the "specific weight." Therefore, for the same loss of pressure in the same distance and the same size of pipe, the relative weights of water transmitted would vary as the square roots of the specific weights. The weight of a cubic foot of water at 400 degrees is approximately 53 pounds, and a cubic foot of steam at the pressure of 235 pounds due to such temperature is 0.5478 pounds. The relative weights of the steam and water are therefore as 1 to 96.36. The weights transmitted under like conditions as above referred to, would therefore be as the square roots of these numbers, or as 1 to 9.816. Therefore, if the steam and water be compared on the basis of use for heating buildings exclusively, which, as has been shown, is most advantageous to the water system, there would, as has been stated, be required a circulation of 5.694 times as many pounds of hot water as of steam, but 9.816 pounds of water would, under like conditions, be circulated to 1 of steam. The relative capacities of the pipes required to convey the steam and water under like conditions would then be for the steam 1, and for the water, the increased weight required—viz., 5.694 divided by the increased weight conveyed—viz., 9.816, or as 1 to 0.5796, or as 1.7253 to 1. But the carrying capacities of the pipes are not as the areas or the squares of the diameters, but on account of the friction element, as the square root of the fifth power of the diameters, on which basis, under this most favorable condition for the water-pipe, the diameter of the steam-pipe would require to be but 24.38 per cent. in excess of that of the water-pipe. This does not, however, represent the relative cost of the system. For heat taken the same distance, the return pipe of the water system must be as large as the direct pipe, whereas that of the steam system, which has to do but about one-sixth of the work, could, on merely theoretical conditions, have a carrying capacity that much smaller. For practical reasons which, as will be shown hereafter, will have greater force with the water system, this pipe is made somewhat larger, or on the average about one-half of the diameter of the steam-pipe. On the basis that the costs are proportioned to the lengths and diameters, which is not far from correct when the two pipes are laid together in the same trench, the cost of the steam-pipe of 1.2438 diameter should be increased one-half

to allow for the return pipe, making in the case of the steam system 1.8657 compared with 2 as the cost of the full-size double pipes of the water system, which numbers are as 1 to 1.072. That is, even under the most favorable conditions for the water-pipes, they would cost at least 7 per cent. more than the steam-pipe system, and even this result is obtained by favoring the water system in the calculations, for the reason that the water has to be pumped double the distance that the steam is conveyed, and therefore requires double the difference of the pressure. However, as this pressure is produced with a pump, for simplicity the comparison has been allowed to stand as above.

If the water-pipes were designed to furnish power at a distance by generating steam to be used at 70 pounds pressure, it would be necessary, as stated, to circulate 10.2 times as much water as would require to be evaporated for steam used directly, when, on the same basis previously discussed, the water-pipes would require to have 3.9 per cent. greater carrying capacity under like conditions than the steam-pipe—that is, would require to be of 1.55 per cent. greater diameter, when the cost of both the direct and return water-pipes would be 35.4 per cent. greater than that of the steam-pipe and its smaller return-pipe.

If, however, the water-plant were designed to furnish water for cooking purposes, and the temperature were maintained in the stoves at 400 degrees by circulating, as claimed, water of only 400 degrees, there would be required the circulation of an infinite quantity of water to fulfill this condition. If, however, the temperature in the stoves were allowed to fall one degree below that of the water there would require to be circulated, as first stated, something over 600 times as much water as would be required to be evaporated and conveyed if the work were done by steam. Without stopping to calculate the size of the enormous pipe required on this basis, we may assume, as before, that in practical work a loss of say 11.15 degrees would be permitted. On this basis, as stated, the water required to be circulated would be 72.21 times the weight of steam required to do the work, so the water-pipe would necessarily have 7.407 times the carrying capacity of the steam-pipe, or 2.228 times the diameter, and the cost of the two systems of piping on the basis above explained would be as 1 for the steam to 2.97 for the water. We thus see that in doing exclusively the work for which these high-pressures are principally to be carried—to wit, cooking—instead of the steam-pipes requiring to be 46½ times the area, or 5.8 times the diameter of the water-pipe as claimed, the water-pipes must have 7½ times the carrying capacity, be of about 2¼ times the diameter, and about 3 times the cost of the steam-pipes. The relative cost of the pipes by no means represents the cost of operating the two systems. The water system would always be at a disadvantage in this respect on account of the high cost of pumping.

It should be stated that it is proposed to use steam for power at only 20 pounds pressure, but it is unnecessary to say that this would involve a very extravagant use of steam, and the size of the pipes would only take an intermediate position between those given for heating and power, respectively. It may also be claimed that the fall of pressure available to transmit steam is limited, whereas the pressure available by pumping to force the water is comparatively unlimited. This will not sustain investigation. With an initial steam-pressure of 80 pounds a loss of pressure of but ten pounds will give, in a steam-pipe 12 inches in diameter and one-half mile long, a velocity of fully 80 feet per second, so that there will be readily transmitted, through such pipe, nearly 1,700 horse-power of 30 pounds of feed water per hour for that entire distance. The most unfavorable conditions for the transmission of steam are when used for cooking where a high temperature is to be maintained; but even in this case, unless the assumption be made that the water will maintain the ovens at 400 degrees with steam at 400 degrees temperature, which, as has been stated, will require an infinite quantity of water circulated, there must be some loss of temperature, and as soon as it is permitted to drop, so that instead of fabulous quantities only 72 times as many pounds of water is required to be circulated as of steam, the loss of temperature of about 11 degrees entails a loss of pressure of 30 pounds, and but a portion of this difference of pressure will circulate the steam as fast as would be safe for the permanence of the pipes. With water the velocity would need to be kept down in the inverse proportion of its density compared with that of steam, for a similar reason. If the necessary loss of temperature for cooking be made up by increasing the temperature of the water, this would also, in a much greater ratio, increase the pressure of the steam and still keep it at an advantage.

An average presentation of this branch of the subject may be had by examining the pressure available when the hot-water and steam are used to furnish steam for power. In the case of the hot-water, in order to evaporate about ten per cent. of its volume into steam, the reduction in temperature will be that due to a fall in pressure of 165 pounds, or from 235 down to 70 pounds. In a steam system this entire difference of pressure may be used as the energy which transports the steam to the point where it is used, and as the pumping pressure on the principles above expressed must be double this, the circulating pump would require to work against a pressure of 330 pounds to compete with steam, and 0.2 times as much water must be pumped with the water-plant as would be required by the steam-plant; also the water for the water-plant must be pumped twice—once at the high-pressure of 330 pounds to circulate it in the pipes, and again at 235 pounds to pump it into the boiler; whereas, with the steam-plant one-tenth of the quantity of steam would be pumped and but once—viz., into the boiler—how,

ever, be claimed that the steam-plant must be charged with the power required to return the water of condensation. The water is returned in practice by the pressure in the heating systems or by steam operating pumps, or pump-traps which exhaust into the heating systems, so that no heat is wasted, and the losses are too inconsiderable to mention in comparison with the handicaps of the water system.

The hot water circulated has been called "superheated water," because it is hotter than 212°, but, of course, water cannot be superheated in the scientific sense that its temperature exceeds that due to its pressure. Steam may be superheated and must always have as high a temperature as that due to its pressure. Water cannot be superheated, but may, of course, have a pressure greater than is due to its temperature; in other words, be *sub*-heated, which is the condition that the so-called superheated water would be in when maintained at constant pressure the moment it imparted any heat to another object.

Reference must finally be had to one point, which has been made to appear very important on paper. The following quotation may be made:

"The fuel cost of the power developed by the steam-engines employed in [a hot-water] system for circulating the superheated water in the hot-water pipe, for pumping the used water from the return pipe into the boiler, for driving the blowers, if a mechanical supply of air is needed for the combustion of the coal, and for hoisting coal and its refuse, will, owing to the peculiarity of the system, be not over one-twelfth of the similar cost per horse-power developed by the most economical steam-engines employed in other work. In fact, the only coal required to work these circulating, pumping, blowing, and hoisting steam-engines, is what furnishes the heat actually transformed into work according to the thermodynamical theory, and to supply the loss of heat by conduction and radiation from the external surfaces of these engines. The cooled water from the return-pipe will be in such excessive quantity compared with the feed-water required for generating the steam used in the engines, that it will be enormously more than sufficient to condense all the steam worked through the engines, the condensed steam and the water condensing it will be wholly pumped back into the boiler, and there will be no rejected heat as in the case of other steam-engines, which rejected heat averages about eleven-twelfths of the total heat of the vaporization of water. If the cost of the indicated horse-power in the best engines be taken at about 2½ pounds of ordinary coal per hour, that cost, with the engines of a [hot-water] system, will be only one-tenth of a pound of coal per hour. The steam taken from the boilers at a temperature of 400° Fah. (pressure 250 pounds per square inch above zero) for working the engines, will be condensed by the water of the return-pipe at the temperature of, say, 160° Fah., and both the water of condensation and the condensing water will be pumped into the boiler, so that the total quantity of water in the boiler and in the hot-water pipe and in the return-water pipe will always remain constant."

With all the hot water used for power purposes rejected at a temperature of 316° and that for cooking at 390° or upward, how is the very large quantity of heat still remaining in the water to be reduced to the temperature of 160°, as stated in the above extract? It may be said it will be used for heating water, boiling articles of food, heating buildings, and such like uses. But what can be done with it in summer when there is no heating to do; but even in winter, or at any other time, in fact, how is the surplus heat in the hot water from cooking and power apparatus to be exactly that required for some other culinary operation or for heating some particular building? The slightest calculation will show that the surplus heat will be so great that it cannot in practice be reduced to the temperature stated. The low temperature of the return water could only be secured in individual instances in buildings provided with specially large heating coils arranged to receive the water as it was about to escape to the street. Houses and public buildings already provided with heating apparatus would necessarily have connections made to the apparatus in place, and the heat would be rejected at the temperature of the steam used for heating, say at the temperature due to five pounds, as has been provided for in the previous calculation. In no case, as has been intimated, could it be assured that the surplus heat from the cooking apparatus would not exceed that required for other culinary operations and heating the house. In seasons when no heat was required the only economical way to dispose of the hot water at 390° rejected from the cooking apparatus would be to pump it back to the station at that temperature and at the temperature due thereto. The result would only be worse were it allowed to expand down to atmospheric pressure, for then a large portion would fly into steam and the return-pipes be filled with a mixture of steam and water. If the hot water were used to generate steam for power the surplus heat would be so great that it would be impracticable to dispose of it in the same or adjacent buildings even during the heating season. Few factories can use all the exhaust steam from their engines, whereas with the water system there would be about five times as much heat in the rejected water as would be used in the engine. If part of the latter be used for heating, the heat in the exhaust steam must be absolutely wasted. In fact, at all times a very large quantity of hot water must be rejected at the temperature of 316° due to the pressure, and as in the case of cooking the only economical way would be to return it to the station at a pressure of 70 lbs. If it were permitted to expand down to the pressure of the atmosphere, there would be 2.89 cubic feet of steam per pound of water circulated, or 29.4 cubic feet of

* (C) Temperature due to 5 lbs. 227.96°, equivalent to 196.66 heat-units above 32, which latter subtracted from 373.75 heat-units in water due to 235 lbs. pressure, gives 177.09 heat-units per pound of water, and subtracted from 1,204.21, total heat due to 235 lbs. pressure, gives 1,027.12 heat-units available from steam between same limits, so that there will be required $(1,204.21 \div 177.09) = 6.80$ times as much water circulated as steam.

steam at atmospheric pressure in the returns for each pound of water evaporated into steam for use in the engines, and the volume of steam in the return-pipes would be about 60 times as large as the water contained in the same. Of course, in a small plant for exhibition purposes, radiators may be arranged to keep down the temperature rejected from cooking and power systems, but a slight study of the problem will, as above indicated, show that the demands for different purposes cannot be adjusted, even in winter, so as to prevent the rejection of a great deal of heat, and that in summer the heat in the water can practically only be utilized through a small range of the higher temperatures, and much the greater part of the heat must be rejected, though it may be returned to the station at great cost and be saved if practical means are found for the purpose.

The writer has thus far discussed the subject in the abstract without comparison with other work. At this point it may be of interest to state that precisely the feed-water apparatus described above has been used from the first in the plant of the New York Steam Company designed by the writer, and that we are barely able to condense the steam which comes back in the returns *when half the feed-water is supplied directly from the Croton mains* to make up for the loss due to the escape-steam from high-pressure engines supplied on the lines. At times a portion of the steam from the pumping-engines can also be condensed in the tank, but at others a portion of this escapes. It is utterly hopeless to do better or even as well with a very much larger proportion of hot water supplied from the returns.

If the present proposed system, to return the water at high-pressure, be changed, then, without helping the feed-water question, all the old complications of the former developments of the system will be necessary in every house, and under some circumstances boilers would necessarily be used on the premises arranged to be heated by hot water instead of fuel. On the other hand, if steam be used merely the full range of temperature is available for every operation, and the heat rejected due to the smaller quantity of water required be readily returned to the station by the surplus pressure in the pipes.

It will naturally be asked what the probable cost of pumping the hot water will be. This requires the assumption of a certain set of conditions. Previous discussion has been based on allowing the hot water a difference of pressure at the two ends of the line of twice that allowed to the steam between the station and the point of use. On this basis, with a comparatively low-pumping pressure, say a difference of twenty pounds between the extremes of the line, the net power required for pumping would be somewhat more than one per cent. for each volume of water pumped compared with that required to be pumped in the boiler for a steam system. Reckoning the efficiency of steam-pumps at 50 per cent. on the basis of one horse-power for the heat required to evaporate 30 pounds of water from 70 pounds pressure per horse-power, there would be required for circulating water for heating fully 11.4 per cent. of the power transmitted through the pipes; for power there would be required fully 20.4 per cent., and for cooking fully 145.4 per cent. Higher pumping-pressures would of course entail higher losses. For the steam plant, on the contrary, there would be required on the same basis for pumping the water in the boiler, a little less than two per cent. of the power transmitted, and this cost would be independent of the loss of pressure in transmission. The water in the returns would be forced back, as has been stated, by surplus pressure. It will be seen therefore that the water plant will not only be more expensive to construct originally, as well as more difficult to operate, but that the actual cost of the operation would be greater in the proportions stated, independent of many other considerations which cannot here be discussed, which would make the cost still greater on account of the indirect method of doing the work.

The resistance to explosion of the steam and of the water-pipes could be made the same originally by increasing the thickness of the water-pipes proportionally to their increased diameters; but if high capacities were attempted by pumping water at very high velocities the pipes would be rapidly scoured out so as in time to become dangerously thin. In case of a break in the steam-pipe the steam dissipates at once and is not dangerous. The writer has known a case where, through carelessness of workmen, a man was struck full in the body at a distance of only a few feet by a jet of steam two inches in diameter issuing from a pipe at eighty pounds pressure, but no injury to his person whatever resulted. Evidently, however, a single quart of hot water, projected in the same way, would have caused fearful scalds, and anything like the same quantity of water as of steam would have caused a lingering death. Hot water is also very destructive when the pressure is suddenly released, and the flying particles would scald persons and do other injuries, even when projected long distances.

It is interesting to see all the operations of cooking performed by hot water of high temperature, but evidently every one of these operations could be performed equally well by steam with the pressure due to such temperature, and all the operations would be much more simple and economical. In other words, the advantages due simply to high pressure are claimed for hot water. It may be said that the hot water at the high temperature ought to be compared with steam at the pressures ordinarily carried, but the steam can be supplied at the high pressure much more readily than the water. There is, however, a separate question as to the relative advantage of transmitting steam, at the high pressure of 235 pounds referred to above, compared with a transmission at a pressure

of 80 or 90 pounds corresponding to that ordinarily used in practice. Evidently the lower pressure will supply all the steam which is required for heat and power purposes quite as well as if generated at the very high pressure. The only possible object in increasing the pressure would be to do some kinds of cooking which cannot be done with the lower pressure, and it may be claimed to save something in the size of pipes. So far as the latter is concerned, the increased thickness must also be taken into consideration. The culinary operations which require the greatest amount of heat are the heating of water and the boiling of meat and vegetables. This can be done with perfect satisfaction with a steam-pressure but little above the atmosphere, say at the ordinary heating pressure of 5 pounds or under. Meat may be roasted and browned satisfactorily if put in steam-jacketed vessels directly on the metal with a steam-pressure of 40 pounds. This is done every day in many saloons. Of course, steaks and chops can be cooked in the same way if desired, though without the aroma of slightly scorched meat as in broiling. Cake and bread can be cooked, but not browned, with a steam pressure of 80 pounds. The higher pressure of 235 pounds is only required for such operations as broiling meat, and for the baking and satisfactory browning of bread and cake. But little bread is baked in private houses, and that required may be sent either to the bakers or be done in the house by customary methods on a particular day of the week. The other operations stated as requiring a high temperature can readily be performed at very slight expenses with gas-stoves. When the comparatively small income to be derived from this particular work is considered in connection with the enormous cost required to do such work, particularly with hot water and also to some extent with steam, it appears to the writer that it will not pay to go to the extra expense and risk necessary to carry steam or the more expensive hot water at such high pressures for this purpose alone, and it is hoped that this presentation will enable others who are required to assume responsibilities in this direction to judge for themselves what limit, everything considered, is the best method to adopt.

THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

[Report continued from page 17, issue June 4.]

(From Our Own Correspondent.)

THE fifth paper, by J. T. Hawkins, on "Education of Intuition in Machine-Designing," was discussed by Messrs. Smith, Webber, and Denton. The sixth paper, by C. E. Emery "Notes for Discussion on Cylinder Condensation," was discussed by Messrs. Denton, Stirling, Strong, and Babcock. The author states that no steel should be used for boilers unless previously properly inspected. The next paper was by same author on "Notes on Limit of Pressure in Marine Engines." The eighth paper, on "Comparative Value of Steam and Hot Water for Transmitting Heat and Power," by C. E. Emery, was discussed by Messrs. Porter, Stearns, Wolff, and Babcock. The next paper, by Albert Stearns, on "Evaporation by Exhaust Steam," was discussed by Messrs. Babcock and Miller.

In the morning of the second day's session a visit was made to the Bureau of Engraving and Printing, where the fifty-two different operations of the printing of bank-notes was witnessed; the Smithsonian Institution and the National Museum was also visited.

At 2 P. M. a third session was held, when a paper by H. R. Towne, entitled "Methods of Determining Cost and Distribution of Heat and Power," was presented, and consisted mainly of a detail of tests made by the author.

The second paper of the evening was by William Kent, entitled "A Problem in Profit-Sharing," which produced a long discussion on the labor question by Messrs. Hewitt, Hawkins, Towne, Doane, Stirling, Emery, Woolson, Scott, Fowler, and Ashworth. The remaining portion of the session was spent in discussing topical questions.

In the evening the members attended a reception given them by Hon. Josiah Dent, on U Street. The house belongs to the colonial period of the city, and is notable as the one in which Lafayette was entertained by J. C. Calhoun. The members were received in a very cordial manner and entertained with a collation and music.

In the morning of the third day a trip was made to the home of Washington at Mt. Vernon.

A dinner was served at Marshall Hall, on the opposite banks of the river, which consisted principally of plank-baked shad; this is prepared by nailing the fish to an oak plank and placing it before a wood fire, where it is kept until cooked.

In the evening the fourth session was held. A paper was presented by H. A. Ramsay on "What are the Needs of Our Navy?"

Additional interest was given to this paper from the fact that the author was on the "Merrimac" during its engagement with the "Monitor." He recommended fast cruisers which can run away from foreign iron-clads. A test of speed should be made over a measured mile, just as the English do, in order to make the comparison fair. Powerful steel-armored vessels should be built for coast defense of 14,000 tons. "From my observation in the 'Merrimac'-'Monitor' fight, I am convinced that the inclination of the resisting armor will greatly diminish the effect of the shot. On the 'Merrimac' we had only four inches of armor, yet the eleven-inch shot from the 'Monitor' all glanced, with one exception, and this shot struck us, point-blank, between wind and water, right on the knuckle, where for a short distance the shield was vertical, and this shot, although it did not get through into the vessel, broke

the iron, and sent off large splinters from the wood backing, and forced down one of the deck carlines into the engine-room." This shot, he states, was a shell and not solid. The paper was discussed by Messrs. Crane, Stratton, Kent, Smith, and Grimshaw.

The next paper was by J. Morgan, Jr., on "National Defense and its Mechanical Problems." He states, that to permit a concentration of the naval force at any desired point, the defense of any port must be completed without a navy. The writer favors forging all gun-metal, as "the difficulty of getting a good quality of gun-steel from unforged metal is great, and increases with the size." This forging process is strongly condemned by Mr. Metcalf, in his paper read before the American Society of Civil Engineers. The writer favored building up guns by shrinkage. Discussion followed by Capt. Roger Birney, Lieut. Wheeler, Stirling, Grimshaw, Emery. The session closed after a discussion of topical subjects.

Friday morning was spent by visits to public buildings, and a large number went to Cabin John Bridge, which is said to be the largest stone arch in the world.

The fifth session was in the afternoon. The first paper was by T. S. Crane, on "Direct-acting Steam Veneer-Cutter." This paper was illustrated and gave a detailed description of a knife-cutting veneer machine. Discussion followed. Then followed a paper by George H. Babcock, "New Method of Making Tubes from Solid Bars," which was a mechanical device of much interest, and discussed by Messrs. Hewitt, Spellman, Kent, Barker, Wilcox, and Stirling. The next paper, by James Dredge, on "Gas-Lighting by Incandescence."

After a short discussion on topical subjects the convention adjourned, a majority of the members leaving the headquarters at Willard's Hotel in the evening.

The following is the list of members and guests continued:

G. H. Barnes, Boston; James Butterworth, Philadelphia; A. W. Colwell, New York; T. S. Crane, Newark; J. A. Crouthers, New York; J. G. Dagron and wife, Baltimore; J. E. Denton, Hoboken; W. H. Doane, Cincinnati; W. H. Francis, Philadelphia; D. R. Fraser and wife, Chicago; N. D. Fraser, Chicago; M. P. Higgins, Worcester; C. P. Howard, Hartford; William Kent, New York; E. D. Leavitt, Jr., Cambridgeport, Mass.; T. W. Leavitt, New York; W. T. Magruder, Baltimore; C. H. P. Manning, Manchester, N. H.; C. C. Porter, New York; H. A. Ramsay, Baltimore; S. L. Randolph, Mt. Savage, Md.; A. W. Robinson, Philadelphia; — Rowell, New York; J. Rose, New York; O. Smith, Bridgeton, N. J.; S. Schutte, Philadelphia; T. B. Stearns, Denver, Col.; G. R. Stetson, New Bedford, Mass.; J. F. Steward, Chicago; E. P. Stratton, College Point, N. Y.; J. E. Sweet, Syracuse; H. R. Towne, Stamford, Conn.; G. B. Whiting, Washington, D. C.; R. R. Zell, New York; W. H. Bailey, New York; R. Inch, Washington; T. W. Barber, U. S. A.; J. H. Allen, Woodbridge, N. J.; D. Ashworth, Pittsburgh; S. E. Babcock, Little Falls, N. Y.; S. W. Baldwin, New York; C. W. Copeland, New York; M. N. Farney, New York; S. A. Hand, Toughkenamon, Pa.; C. S. Huston, Coatesville, Pa.; J. Livingston, New York; — Ruthersworth, Philadelphia; H. See, Philadelphia; J. Walker, Cleveland; G. C. Hawkins, Boston.

CONNECTICUT CIVIL ENGINEERS' AND SURVEYORS' ASSOCIATION.

A REGULAR meeting of Connecticut Civil Engineers' and Surveyors' Association was held at C. E. Chandler's office, Norwich, Conn., June 7.

The following new members were elected: R. C. P. Coggeshall, C. E., Superintendent Water-Works, New Bedford, Mass.; A. B. Drake, City Engineer, New Bedford, Mass.; L. A. Taylor, C. E., of Boston, Mass., Engineer for W. C. McClallan, contractor; C. H. Truesdell, C. E., of Central Village, Conn.; Joel M. Wheeler, Engineer of the Ansonia Brass and Copper Co., Ansonia, Conn.; J. E. Dutton, Engineer Gates & Parks' Granite Works, Niantic Conn.; C. V. Pendleton, C. E., Superintendent Substructures Berlin Bridge Co., E. Berlin, Conn.; Edgar Clark, C. E., Putnam, Conn.; Henry T. Potter, Consulting Engineer, Norwichtown, Conn.; Robert R. Smith, C. E.

The morning was spent in visiting the Norwich Bleaching, Dyeing and Printing Co.'s works, through courtesy of E. P. Gardner, engineer for the company and member of the association, and the Greenville Dam, through courtesy of Hiram Cook, C. E., President of the Norwich Water-Power Co. The special features of the Greenville sewers were shown by the city's engineers.

After dinner at the Wauregan House, a second excursion was made in company with the Mayor, members of the Board of Water Commissioners, and the Superintendent of the Water-Works, which included a visit to Norwich Falls, a drive around the Norwich City reservoir, and a visit to the Ponemah Mills Dam.

In the evening a paper was read by W. H. Burnett, of Norwich, on the "Relation of Photography to Engineering," illustrated by views and prints.

Notes giving facts in relation to the various works visited by the party during the day were also read.

Blue Prints of "Reservoir Dams and Embankments" and "Anchor-Ice" were distributed by W. H. Richards, of New London, and of a "Break in Brick Sewer" and "Plan Case" by C. E. Chandler.

HOT-WATER HEATING AND FITTING.

BY "THERMUS."

No. VI.

(Continued from page 15.)

THE diagram Fig. 14 I have constructed to show the expansion of water according to Dalton—from mean temperature to 212° of the scale of Fahrenheit's thermometer; in other words, to show the expansion of water from the

FIGURE 14.

FIG. 15.

temperature at which its bulk is smallest and its density greatest to its greatest bulk and least density, under the pressure of our atmosphere at sea-level, and which covers all the ranges of temperature and bulk ever likely to take place in an open or low-pressure circulation. It will be noticed the base line is laid off into divisions of 10° Fah. (excepting the first, which is 12°) from 40° to 212°; that the perpendicular line of figures, which represent inches, is the expansion or increase of length of a ten-foot column of water when warmed from 40° Fah., and that the ordinates of the curve show the coefficients of the expansion of water irrespective of volume.

The diagram Fig. 15 has been constructed to show the

velocity of the flow of water in feet per second when the height from which it falls is known. The lower, or base and horizontal lines, are divided into feet from 0' to 8', as probably covering the greatest range of velocities found in ordinary apparatus, while the vertical lines represent in inches the expansion that will be found to take place in a column of water. It is intended that these two diagrams (Figs. 14 and 15) be used together.

For instance, let us assume we have an apparatus ten feet high, such as we might find where only one floor of a building was warmed. Let us assume now that the water goes up in the flow-pipe at a temperature of 182° Fah. and returns at 162° Fah. What then should be the greatest possible velocity of the water through the rising flow-pipe? Let us return to diagram Fig. 14 and see what the column in inches reads for a temperature of 182°. We will find it to

fifteen feet and the expansion of the water is that due to the rise of temperature between 152° and 202° Fah. For a 10-foot column, as per diagram, we find it to be 4.111'—2.111' = 2.000', which is the rise for a 10-foot column at 202° Fah. over one 152° Fah. But as our present column (Fig. 16) is 15 feet we have

$$\frac{2.25' \times 15'}{10'} = 3.375'$$

as the increase for the 15-foot column.

If we now turn to diagram Fig. 15, and approximate 3.375' on the inch column at the left, we will find where a pencil line run horizontally will cross the curve. From this point if we drop a vertical line we will find it bisects the base line at 4 1/4'—as near as we can approximate—giving us the greatest possible theoretical velocity in this case as 4 1/4' feet per second.

The velocities already spoken of are the theoretical ones, no allowance being made for friction, and they can very

FIG. 16

nearly be obtained through a short, smooth, taper nipple or nozzle when measured at its point of smallest diameter.

ENTRY OF WATER INTO PIPES.

According to all competent authorities on hydraulics, the efflux through a circular aperture in a thin plate is only .615 of the theoretical flow, on account of the convergence of the

FIG. 17

current at a short distance outside the plate. We, however, have nothing to do with such conditions, unless it should be to roughly calculate the time a vessel would take to become empty through a plug-hole, and which would be out of place here.

When an aperture is through a considerable thickness or through a short parallel tube projecting outwards, whose length is not less than twice its diameter the discharge has

be 3.111 inches. Now see what it is for a column at 162°, and we find it 2.111, the difference being 1/8 of an inch. If we now turn to diagram Fig. 15, and approximate .8 of an inch on the vertical scale of inches, we will find that a horizontal line drawn with our pencil so as to start at 1/8 of an inch, will cross the curve line just where the two-foot velocity line crosses it, showing that for a fall of a little over 3/4 of an inch we have a velocity of flow in our pipe of two feet per second. Let us take another example of the same, the better to understand the use of the diagrams.

Suppose we have an apparatus fifteen feet high as shown in Fig. 16. We have now to find the measure of the difference of weight or power that keeps up the circulation in this apparatus. Heretofore we have spoken of the height from which the water falls, but it may appear to the beginner that the water cannot fall in an apparatus of this kind, as it is practically closed, and that there is therefore something to be explained, that the theory of a falling body may harmonize with the water rushing through the pipes of such an apparatus.

Really, there is a hydrostatic head or its equivalent. It may be likened to the increased weight of the cold leg of the syphon or the lessened weight of the warm leg. In the case of an apparatus as in Fig. 16 one may readily think he sees where the head comes in play in producing circulation, as the distance *ac* readily appears to be due to the expansion of the column *cd*, but in Fig. 17 it is not apparent at all. Nevertheless, to consider the question of velocity in pipes, we are bound either to consider the fall of the water in the hot column from *a* to *c* (Fig. 16), or the fall of the cold column from *c* to *e* (Fig. 17), which latter is the measure between the columns *ab* and *cd* for equal weights. It, therefore, matters nothing to us practically whether we consider the height *ac*, Fig. 15, or the height *ce*, Fig. 17, as the measure of the flow, as the result will be practically the same, as any one conversant with the laws of hydraulics knows.

Our diagram, Fig. 14, was made on the increase of height of a column of water due to expansion and not on the decrease due to contraction: therefore we will speak of the head which produces circulation the same as we would of the total head from a reservoir that produces the discharge through apertures or pipes and on which the velocity of efflux or movement depends.

We will return to our example, Fig. 16, to familiarize ourselves with the use of the diagrams. The height *cd* is

been found to be greater than when it is through a plate, and although a contraction of the water takes place it is less than in the former case, reducing the water passed to a little over .8 of the total theoretical quantity due to the head and aperture. This loss is due to the entry of the water into the pipe, there being a reduction or contraction of the water by convergence of its particles which reduces the area of the stream for a short distance within the pipe, and as the velocity at this reduced area is the theoretical one, it stands to reason the amount of water passed is proportional only to the area of the contraction compared to the area of the pipe.

The loss therefore due to the entry into the common form of pipe must be taken as two-tenths of the whole quantity that would be ordinarily supposed to pass, and must be considered separately from the loss due to friction in a long pipe, and must be added thereto and also to the loss for bends, elbows, etc., when the latter is known, as will be explained later.

(TO BE CONTINUED.)

DEFECTIVE HOT-WATER CIRCULATION.

NEW YORK, May 28, 1887.

SIR: (1) If the correspondent who writes from Hartford will fit boiler up as per accompanying sketch he will not be annoyed further. This will give him hot water in ten minutes.

FIG. 1.

(2) I would be obliged to you for a little sketch as to how I can heat a back parlor by means of hot-water circulation from kitchen water-back. Room is directly over kitchen. Yours very truly, L. D. H.

[1. By the above arrangement (Fig. 1) our Hartford correspondent (H.) will receive a limited quantity of warm water at a basin in a very much shorter time, after the starting of a fire, than with the plan shown in his diagram (page 689, of our issue May 28), for the reason that he will draw the water directly through the water-back without its passing through the boiler. If he

FIG. 2.

has to draw a large quantity of water, however, as for a bath, the gain in time is not so apparent, if at all, for the reason water will not warm as fast as it will be drawn.

2. In the matter of warming a back parlor from a water-back, we would suggest the plan shown in Fig. 2, if the warming of the room is of more importance than the warming of the water in the boiler. If, on the other hand, the water at a sink or lavatory is of the greatest importance and the desire to warm the room secondary, arrange it as in Fig. 3. Let the flow and return pipes be all 1-inch in

diameter, with easy and long bends, and use a vertical pipe or loop hot-water radiator of not more than forty square feet for a 1-inch pipe connection. Ream the ends of the pipes and clean all obstructions to flow. Even if the couplings or nipples of the water-back are only three-quarter inches increase the size of the flow and return pipe as stated, and do it with 1x3/4 couplings at once.

N. B.—Unless you have a good water-back, etc., we would not advise the warming of a room by such means; though when you have a valve on the radiator you can close it should you find the boiler not sufficiently hot. Still it is sometimes successfully performed for both purposes, and a plate-warmer in dining-room may be fitted this way nicely, without taking too much heat from the boiler.]

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

BUILDING CONSTRUCTION IN JAPAN.

NEW YORK, June 4, 1887.

SIR: The posts spoken of by Mr. Conder, Professor of Architecture at Tokio (THE SANITARY ENGINEER AND CONSTRUCTION RECORD, June 4), which he imagines are placed in the centre of pagodas for the purpose of stiffening the structure in case of earthquakes, and which, to his surprise, do not touch the ground, are pendulums suspended from the roof, which, having a vibration of their own (the moment the building begins to sway under the influence of an earthquake), counteracts the vibration of the building as a whole. Yours, LEOPOLD EIDLITZ.

ZINC PLATES.

June 2, 1887.

SIR: Can you inform me if there is any plate-zinc made in this country about one-eighth of an inch in thickness, and if so what size of plates they make, and where? Yours, A. LEAYS.

[Write to some firm of metal dealers.]

PLUMBING CATECHISM QUERY.

NEW YORK, June 6, 1887.

SIR: In reply to Mr. Knight's query in your issue of the 4th inst., I would say that the reply to which he refers was somewhat incomplete. It would have been better to have stated that under the conditions named a deep-seal trap, like a pot-trap, would have been preferable so far as resisting syphonic action. E. M.

SIZE OF VENTILATING-PIPE FOR A ROOM.

SIR: I should like very much to have your valuable advice in regard to the necessary square area of a metallic pipe, sufficient to ventilate a room 35'x40'x11' high. No steam-coils or fans or any other power can be used. The pipe will be placed on the outside wall and runs seventy feet above the room to be ventilated. How many square inches in pipe would you advise me to use for each 1,000 cubic feet of room to be ventilated? What book would you advise me to buy for a perfect study of ventila-

tion? By answering the above questions you would bestow a great favor upon

READER.

[To answer the above question it is necessary to know what the room is to be used for and how many persons are to occupy it. If the room is to be warmed by heated air it will probably be necessary to change the air in the room three times per hour to secure satisfactory warming in cold weather. As the room contains 15,400 cubic feet, this would require a change of air of about thirteen cubic feet per second, which could be readily disposed of by a pipe having three square feet of area. This, however, is the smallest part of the problem. A metal pipe seventy feet high on an outside wall will chill so rapidly that it is the worst possible kind of ventilating-flue in cold weather. The real difficulty is probably to get the fresh air into the room and have it satisfactorily distributed. The best book to consult on this subject is "The Principles of Ventilation and Heating and their Practical Application," by Dr. John S. Billings, U. S. A. Sold by the Book Department of THE SANITARY ENGINEER & CONSTRUCTION RECORD. Price, \$3.]

E. G. LOVE, Ph.D., Gas Examiner.

MUNICIPAL IMPROVEMENTS AT BIRMINGHAM, ALA.

A CORRESPONDENT of the *Commercial Gazette* says that Birmingham, Ala., has fourteen miles of pipe sewers, and will build four miles this summer, besides several large sewers for removal of surface-water. He says:

"The water-supply of the town is at present neither sufficient nor of the best quality. The present water-works were built for a town of three or four thousand inhabitants, and proves now to be inadequate.

"The supply is gotten from Village Creek, a small mountain creek, by damming it up and catching the surface-water, with a few springs to assist in feeding it. This makes the water subject to great changes during the rainy season. It is often very muddy. They have no way to filter it, and this causes considerable complaint. The company enters the city through a 22-inch main, and has twenty-five miles of pipe laid.

"The Elyton Land Company are now building new water-works. They will bring water through an aqueduct six miles long.

"One important feature is a special reservoir for the south side, placed high up on the mountains to give them as much fire-pressure as possible. It is calculated to give a pressure of ninety pounds.

"There are now fifty fire-plugs. Seventy-eight more will be added this summer.

"Granite paving is now being laid."

BROOKLYN HEALTH REPORT FOR 1886.

THE annual report of the Department of Health of the city of Brooklyn for the year 1886, by A. Otterson, M. D., Commissioner, differs from most municipal sanitary reports in that it contains no detailed tables of vital statistics. Dr. Otterson states, however, that the mortality-rate of the city for the year was 21.44 per 1,000, the estimated population, including that of the new Twenty-sixth Ward, being 745,108. The most interesting part of the book to sanitarians is that relating to the work of the chemists of the department contained in Appendix I. This includes reports on foods and food products by the Chief Chemist, Dr. E. H. Bartley; reports on factory and nuisance inspections, by O. Grothe; and on oil refineries, and on the use of copper in foods, by W. H. Kent. Under date of December 14, 1885, is a special report by Dr. Bartley on the water-supply of the city, in which he pointed out certain risks of contamination of the drove-well supply located near Spring Creek. It would have been well to have stated a year later what was done to prevent this danger. The reports on inspections of chemical work, oil refineries, etc., are very interesting, as giving accounts of the meth-

ods of disposing of sludge acid and other waste products, and of the causes of the chronic nuisances connected with Newtown Creek.

Mr. Kent seems to suspect that the laws are not carried out with regard to the disposal of sludge acid, for he finds that a considerable portion of the sulphuric acid used is unaccounted for by the amount of sludge acid reported as taken to Barren Island or dumped at sea. Taking these reports in connection with those which have been made upon the Newtown Creek nuisances by the State Board of Health, it seems tolerably plain that considerable improvement has been made in the methods of disposal of the waste products of the oil refineries, but that there is room for more, and that other waste products, with sewage, still make this creek an offensive nuisance which is unnecessary, and which under existing laws might be greatly abated.

The report of Mr. Kent on the use of copper in foods gives a good summary of the discussion on this subject in the Royal Academy of Medicine of Belgium in 1885, and sums up that such use of copper is dangerous, and should be prohibited.

Space is wanting in which to notice the other reports of the various bureaus of the Health Department, most of which are of local interest only, but which indicate that a great deal of good work has been done.

CLEAVES' METHOD OF BLUE-PRINTING.

AT the recent convention of the American Society of Mechanical Engineers Professor R. H. Thurston thus refers to this process:

"It gives me great pleasure to present to the society a copy of a very large blue print made by Professor E. C. Cleaves, of the Sibley College of Cornell University; by a new method devised by him, by means of which almost any desired size may be made.

"By the common method the larger sizes are difficult to make satisfactorily; the plate-glass needed for the apparatus is very costly and is subject to serious risk of breakage, and the whole arrangement becomes clumsy and difficult of management. By the process adopted by Professor Cleaves no plate-glass is required; the apparatus is simple and easily and conveniently handled; and the size and cost of apparatus bear very little relation the one to the other. Any size likely ever to be required in any work of the engineer can be as easily made as the smaller sizes, and the cost and difficulty of construction of the apparatus are never likely to be such as to constitute a bar to the use of this system of printing. There is no practical difficulty in getting up an apparatus to print a drawing ten feet wide and thirty feet long, if it should be found desirable. That here exhibited in illustration of what can be done is three and one-half feet wide and eight feet long, and is probably the largest blue print yet made by any process.

"Professor Cleaves' apparatus consists merely of a cylinder of a length exceeding that of the widest drawing to be reproduced, and of a diameter such that the longest tracing to be used can be wrapped around it with sufficient space to spare to give room for the clamps by which it is drawn into place and held. The cylinder is smoothly covered with felt and the sensitive paper carefully wrapped about it, the tracing to be copied being drawn over the whole and held smoothly in place by spring-clamps which seize its ends. It is found to be easy to lay the tracing smoothly over the surface, and to draw it into contact so perfectly that the work done by this method is even better and more certain than that produced by the ordinary plate-glass apparatus, even with the air-cushion now so successfully used with it. The print shown has a defect at one corner; but it is the only defective one yet made, and was selected to send simply because it was feared that there might be some danger in sending it by express, and it was preferred to risk this rather than another. It is easy, with a little care and with some practice, to make these prints absolutely perfect, much easier than with glass.

"The apparatus being ready for use, it is mounted on a cradle, supported by its gudgeons, and is revolved in the sun by means of a cord leading from some convenient line of shafting; or it may be turned by hand until the exposure is satisfactorily complete. It requires a little more time to print a sheet by this method than by the old, as the tracing and the underlying sensitive paper is but one-half the time exposed to the rays of the sun. With these exceptionally large prints, however, for which only this process would be employed, this is not an important matter. They are not likely to be made every day."

CINCINNATI CHAPTER OF AMERICAN INSTITUTE OF ARCHITECTS ON CINCINNATI ARMORY COMPETITION.

WHEREAS, The Board of Armory Trustees of Hamilton County, O., have advertised for architects to submit plans, drawings, and specifications for an armory in the city of Cincinnati, and as the said Armory Trustees have offered no compensation for such services rendered, nor any premium for meritorious design, nor appointed an expert jury to pass upon the merits of the same, and have, moreover, limited the time for the preparation of such drawings to the short period of twenty-eight days; and whereas, the Cincinnati Chapter of Architects has adopted a code governing competitions,

Resolved, That a committee of five be appointed to present said code for the consideration of the Board of Armory Trustees, and to request them to modify their conditions in conformity with the said code, and to give a reasonable amount of time for the preparation of such designs.

And be it further resolved, That a copy of these resolutions be forwarded to the press for publication.

On motion the following committee was appointed to present the above resolutions to the above Board of Armory Trustees: Messrs. James W. McLaughlin, Charles Crapsey, H. E. Siter, Gustave Drach, Lucian F. Plympton.

NEW YORK ARCHITECTURAL LEAGUE.

THE last meeting of the Architectural League, prior to the summer adjournment, was held at Morrelli's on the evening of June 6, some forty members being present. The especial feature of the occasion was an informal exhibition of drawings by Mr. Clarence S. Luce and Mr. Prentice Treadwell. Mr. Luce's drawings are always delightful from their crisp and taking rendering, and there are few draughtsmen who are so successful in both pen and ink and color.

Mr. Treadwell showed the original sketches for the decoration of the Metropolitan Opera House, a scheme for a "Great Hall" in a California house, a beautiful frieze on buff linen, together with a number of designs for glass, stuffs, etc.

The Executive Committee, through Mr. Crowninshield, its chairman, made a progressive report.

The Committee on Current Work announced that it had decided upon a mid-summer excursion and desired to be informed as to where the League desired to go. It was resolved to go to Newport, Boston, and North Easton.

The meeting adjourned to the first Monday in September.

WESTERN ASSOCIATION OF ARCHITECTS.

THERE will be a meeting of the Board of Directors of the Western Association of Architects, on Saturday, June 18, 1887, at Cincinnati, O. Petitions for the admission of new members or business of any kind may be submitted for action. It is requested that any matter to be submitted be sent to the secretary's office on or before June 15, 1887. James F. Alexander, Lafayette, Ind., is the secretary.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE annual convention for the year 1887 will begin at New York City, July 1, 1887. Members are invited to meet informally at the Society House, 127 East 23d Street, New York, on Thursday evening, June 30.

On Friday morning, July 1, the party will proceed by steamer to Rondout, and thence by the Ulster and Delaware Railroad, the Stony Clove and Catskill Mountain Railroad, and the Kaaterskill Railroad, to the Hotel Kaaterskill, Catskill Mountains, N. Y., arriving in the afternoon.

Sessions for the convention for professional discussion and one for the transaction of business will be held.

An excursion will be made during the week beginning July 3, to visit, on invitation of the Union Bridge Company, the Poughkeepsie Bridge and the city of Poughkeepsie. An excursion will also be made to the cement works and quarries of the Rosendale cement rock at Binnewater, on invitation of Mr. F. O. Norton, F. Am. Soc. C. E.

The Fourth of July will be spent at the Hotel Kaaterskill, where, in the evening, there will be fire-works and a ball.

On the evening of one of the other days of the convention there will be a banquet.

The President of the Society, William E. Worthen, Esq., will deliver the annual address at one of the sessions of the convention.

The arrangements made by the committee provide for return to New York on Friday, July 8.

The arrangements secured for transportation to New York and return are announced in circular form. In order to secure the benefit of these arrangements the instructions contained in that circular must be strictly followed.

The arrangement for special fares has been made with the Trunk Line Association Passenger Committee and with the Central Traffic Association Passenger Department, each for the lines composing such association. Full fare must be paid to New York by each person attending the convention. A return ticket will be sold at New York at one-third fare to persons holding the required certificate, properly endorsed by the Secretary at the convention. For all purposes connected with this special arrangement, *the place of the convention is to be considered and stated as New York*. The trip to and from the Hotel Kaaterskill will be otherwise arranged.

Those who find it impracticable to join the party on the morning of July 1 can proceed from New York either by rail direct, or via the Hudson River, to the Hotel Kaaterskill at any time.

As the summits of the Catskills are usually cold during hot weather, it is advisable to come provided with warm outer garments.

Members of the Society are invited to transmit to the Secretary papers they are willing to present at this convention, in order that a place may be given them in the programme.

The families of members are invited to accompany them to the convention.

The rate at the hotel will be \$3 per day.

The probability seems to be that this convention will have a very large attendance from all parts of the country. The Committee of Arrangements is William G. Hamilton, Stevenson Towle, John Bogart.

ENGINEERS' CLUB OF PHILADELPHIA.

THE regular meeting of the Engineers' Club of Philadelphia was held June 4, 1887, President T. M. Cleemann in the chair; eighteen members and one visitor present.

Owing to the unexpected absence of the author, the paper of the evening had to be deferred.

The evening was, however, profitably spent in a general discussion of the proportions and strengths of certain structures which can hardly be calculated with mathematical precision, such as floors built up of separate layers of boards, ribbed and perforated cast-iron chamber and man-hole covers, balloon frame buildings, etc. Some interesting illustrations were presented.

RUDOLPH HERING'S WORK IN CHICAGO.

[From the *Chicago Tribune*, June 4]

"It is not true that Engineer Hering has been relieved from the Drainage Commission, as falsely alleged by an evening print," said City Engineer Artingstall yesterday. The work of his office has simply been transferred to the City Engineer's office, but the commission remains unchanged. The change was made because it was thought unnecessarily expensive to run the two offices."

Mendacious and malicious reports such as that which Mr. Artingstall contradicts have appeared in a penny paper of this city from time to time during the last three or four months. The expert engineer must have snubbed some of the busybodies connected with the alleged newspaper in question. The fact is that Mr. Hering is to continue in the city's service until he performs the duties for which he was called here. He has no intention of leaving the city. There is no conflict between him and Mr. Artingstall, and Mayor Roche has no intention of discharging him. Mr. Hering is a very capable man who acquired a splendid reputation before he came to Chicago through his work for the National Government and as consulting engineer in Eastern cities.

PERSONAL.

COLUMBIA COLLEGE conferred the following among other degrees at Commencement exercises this week:

Engineer of Mines.—W. H. Aldridge, J. R. Bien, A. L. Burns, E. Z. Burns, E. D. Church, H. M. Cole, J. Lahey, R. Lahey, H. C. Manheim, J. R. Marsh, H. P. Nichols, C. C. Restrepo, G. S. Rice, L. H. Rutherford, J. G. Seligman, F. M. Simonds, F. McM. Stanton, J. A. Staunton, Jr., F. W. Tower, G. F. D. Trask, Joseph L. Warner, Paul Oscar Wells.

Civil Engineer.—Hiram P. Bellinger, Harry G. Darwin, Charles H. Davis, A. M. Heinheimer, B. J. T. Jeup, L. McI. Luquer, H. S. MacKaye, Staunton B. Peck, Jose A. Primelles, George Rowland, Alexander Stevens, Walter L. Tyler, E. Agramonte, Jr.

Bachelor of Philosophy in Architecture.—Harry E. Donnell, Samuel E. Gage, Henry O. Hunting, Rudolph Moeller.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

THE Grant Monument Association invite sketches or designs for a monument or memorial building to be erected at Riverside Park, in the city of New York, over the tomb of Gen. Grant. The association will be aided in the selection of the best design by a jury of experts consisting of eminent architects and artists to be designated hereafter. Details for the guidance of competitors may be had on application to the Grant Monument Association, 146 Broadway, New York City. Designs should be submitted on or before October 31, 1887. The proposed structure should be built of granite, marble, bronze, or other appropriate material, either singly or in combination, and may include both architecture and sculpture.

Dated New York, June 9, 1887.
Alouzo B. Cornell, Chairman Executive Committee,
Grant Monument Association.
Richard T. Greener, Secretary.

A PROTEST FROM ARCHITECTS

THE following dispatch from Washington appears in the San Francisco *Daily Alta*:

"Cluss & Schultz, architects, of this city, were awarded the premium of \$500 for the best plan for the Catholic University, and furnished detailed drawings, receiving the money therefor. The committee then awarded the building contract to Baldwin, a Baltimore architect. Whereupon Cluss & Schultz wrote an earnest protest to Archbishop Williams, claiming that they entered the competition with the understanding that the successful architects were to have charge of the erection of the building, and would not have done so otherwise, and they will not permit any one else to erect a building on their plans. They notify the Archbishop that they will ask the courts to enjoin him from any further use of them."

On inquiry our Washington correspondent learns that the terms of the competition were that the successful architect was to receive the first premium of \$500, and if his plans were adopted, 2½ per cent. on the cost of the building, for making the detail drawings, from which the \$500 was to be deducted. It is for this difference between \$500 and the 2½ per cent. on the cost of the building that Messrs. Cluss & Schultz are contending for and not for the superintendence of the building, and if their plan is being utilized in any way they certainly are entitled to it.

SEMI-ANNUAL MEETING OF THE MAKERS OF BRASS AND IRON FOR STEAM, GAS AND WATER-WORKS.

THE semi-annual meeting of this association began its sessions in Cleveland June 8. The object of this association, as our readers know, is to promote the interests of persons engaged in this industry and, so far as possible, by concerted action, prevent strikes. The officers are: President, Arad T. Foster; Vice-Presidents, George T. Coppins, Edward Worcester, and Charles Harrison; Treasurer, John M. Peck; Secretary, S. L. Morrison; Executive Committee, A. T. Foster, R. T. Crane, E. H. Cole, James Powell, and John Harlin; Business Committee, Edward Worcester, John Clifford, W. H. Douglas, W. F. Kyle, G. T. Coppins, F. X. Russell, W. H. Haines, Dan P. Eells, John Pierce, Charles Jarecki, and S. L. Morrison.

The delegates in attendance at the convention in this city were as follows: Edward Worcester, Crane Bros. Manufacturing Company, Chicago; E. H. Cole, Eaton, Cole & Burnham Company, New York; John Eaton, Oil-Well Supply Company, limited, Pittsburgh; W. H. Douglas, the same firm; A. T. Foster, United Brass Company, New York; John Clifford, L. Wolff Manufacturing Company, Chicago; H. F. Peck, Peck Brothers & Co., New Haven; D. P. Eells, Belknap Manufacturing Company, Bridgeport; J. M. Peck, Haydenville Manufacturing Company, Haydenville, Mass.; George T. Coppins, Walworth Manufacturing Company, Boston; W. F. Kyle, McNab & Harlin Manufacturing Company, New York; H. C. Rouse, Lorain Manufacturing Company, Lorain; W. H. Haines, Haines, Jones & Cadbury, New York; Charles Jarecki, Jarecki Manufacturing Company, Erie; John Pierce, Haxton Steam-Heater Company, Kewanee; Charles Harrison, Charles Harrison & Co., New York; Mr. Farrell, Bailey, Farrell & Co., Pittsburgh; N. O. Nelson Manufacturing Company, St. Louis; Thomas Ahrens, Jr., Ahrens & Ott Manufacturing Company, Louisville; W. S. Payne, Fostoria; John H. McGowan, Cincinnati; James Powell, Cincinnati; Charles Pease, Buckeye Iron and Brass Works, Dayton; S. E. Morrison, of New York, secretary of the association; J. P. Farnum, Farnum's Brass Works, Cleveland; Mr. Ward, Mansfield & Co., Pittsburgh; Mr. Hodge, Dubuque Brass and Metal Company, Dubuque; Mr. Althouse, Western Brass Manufacturing Company, St. Louis; Mr. Prindle, Worswick Manufacturing Company, Cleveland; Mr. Rees, of Rees, Shook & Co., Pittsburgh.

PROPOSALS.

(Continued from page 36.)

IRON ROOF WORK at Dallas, Tex.—Treasury Department, Office of Supervising Architect, Washington, D. C., June 9, 1887. Sealed proposals will be received at this office until 2 p. m. of the 28th day of June, 1887, for the iron work required for the roof of the Court-House, etc., at Dallas, Tex. Each proposal must be accompanied by a certified check for \$300, made payable to the order of the Treasurer of the United States. The right to reject any bids is reserved. The plans and specification can be had, and any information obtained, by applying at this office or at the office of the Superintendent, M. E. BELL, Supervising Architect.

DREDGING. Proposals will be received until Tuesday, June 14, for dredging 15,000 cubic yards, more or less, of the basin at the Third Light House, Depot, Tompkinsville, Staten Island, N. Y. John Mills, First Lieut. Corps of Engineers, Third Light House District.

STEAM-HEATING at Rutland, Vt.—Treasury Department, Office of Supervising Architect, Washington, D. C., June 9, 1887. Sealed proposals will be received at this office until 2 p. m. of the 27th day of June, 1887, for the steam heating apparatus required for the Court-House, etc., at Rutland, Vt. Each proposal must be accompanied by a certified check for \$500, made payable to the order of the Treasurer of the United States. The right to reject any bids is reserved. The plans and specification and any information may be obtained by applying at this office, or at the office of the Custodian, after June 13, 1887. THOS. D. FISTER, Acting Supervising Architect.

FURNISHING 3,000 to 5,000 marble head-stones for soldiers' graves. Until July 5. Address General R. N. Batchelder, U. S. A., Office of the National Cemeteries, Washington, D. C.

DREDGING, rip-rap, etc., for channel from Salt Pond to the Ocean, Block Island. Until June 20. Address Herbert S. Milliken, Town Council, Block Island, R. I.

FURNISHING two pumping-engines, each with a capacity of 3,000,000 gallons in 24 hours, through a 20-inch pipe 750 feet long and against an elevation of 210 feet. Until June 21. Address S. S. Frederick, President of the Board of Water Commissioners, Allentown, Pa.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 32-33-34-35-36.

WATER, SEWERAGE, ETC.

LOS ANGELES, CAL. (Special).—The city of Pasadena, Cal., will this year build a sewerage system. The estimated cost of the complete system is \$250,000. That portion to be built at present will cost about \$130,000 (including farm). Aug. Mayer is the engineer.

FLORENCE, KAN.—Proposals will be received until June 15 for work and materials for a system of water-works for city of Florence, Kan. For further information address Florence Water-Supply Company.

SALAMANCA, N. Y., is extending its water-supply.

PITTSBURG, ILL.—Plans for water-works have been prepared by W. R. Coats, C. E., of Kalamazoo, Mich.

WATER COMPANY.—Organized is the Pulaski, Va., Water-Supply Company, W. C. Bullitt, President.

GALLATIN, TENN.—Address Boyer & Roscommon about water-works here.

SHARON, MASS.—The Sharon Water Company will build works.

FORT SCOTT, ARK.—The *Monitor* reports that steps will be taken very soon to obtain a system of sewers under the Act of 1887.

NEWTON, MASS.—An order is before the Aldermen appropriating \$11,300 for the drainage of the Morse Field District.

MANSFIELD, MASS.—Private parties will, it is said, offer to the State Legislature for a charter for a water company, if the town does not accept at its next town meeting the charter of the present company.

TOLEDO, O.—The east side wants an extension of the water-service. The cost is put at \$12,000.

MERCHANTVILLE, PA., has just completed a water-works after plans by Isaac Cassin, C. E., and Howard Murphy, C. E., of Philadelphia. There is a pumping-station, stand-pipe, and 28,000 feet of water-pipe.

FORT RILEY, KAN., will have a new water-works, costing \$40,000.

TITUSVILLE, FLA., is considering the question of water-works.

ST. LOUIS, MO., is dissatisfied with the quality of water furnished by the water-works, and a committee has been appointed by the City Council to see about putting in the Holly system with spring-water as a supply.

MECHANICSTOWN, MD.—The Mechanicstown Water Company has levied an assessment of \$3 per share on its capital stock of 1,000 shares, for the purpose of commencing the building of a water-works. Proposals for bids for doing the work will be asked for shortly.

PITTSBURG, PA.—The agitation in regard to an extension of the water-supply on the South Side is still going on.

CAMDEN, N. J.—The Water Committee of the Council are considering the advisability of introducing filters at the Pavonia Pumping Station. Representatives of the Hyatt and Croker systems have been before the committee. The committee consists of Messrs. Barrett, Campbell, Barber, West, and others.

BRUNSWICK, GEO.—Plans will be made for \$150,000 worth of sewerage. Address City Engineer.

PORTLAND, ME.—The Portland Water Co. have a new contract to supply the city with water for twenty years. The cost of the new work will be about \$140,000.

FARGO, DAK.—The question of the city purchasing the water-works is again being agitated.

RALEIGH, N. C.—J. C. Brewster has submitted a proposition to the Board of Aldermen for the construction of a system of sewerage for this city. The contract provides that he shall have an exclusive franchise of the works for twenty years from date of completion and acceptance, unless sooner terminated under certain provisions. Aldermen Latta, Cross, Cowper, and Horton are the committee.

DALLAS, TEX.—Mr. Brown, of New York, has made a proposition to furnish 2,000,000 gallons of water daily for \$18,000 per annum.

JEFFERSONVILLE, KY.—Organized is the Jeffersonville Water-Works Company. Horace Scott and others.

SYRACUSE, N. Y.—The City Engineer recommends the construction of an intercepting sewer for the Ninth and Fifth Wards. He estimates the diameter at six feet.

AKRON, O.—City Engineer W. D. Chapman has reported to the City Council on the necessity of constructing at least 100,000 lineal feet of sewers at once.

ENGLEWOOD, N. J.—The Improvement Association has appointed a committee to solicit subscriptions to pay for employing an expert to make a plan for sewerage for the town. In a few months water will be introduced and it is hoped a sewerage system will also be introduced.

MILWAUKEE, WIS.—The Finance Committee of the Common Council have, in accordance with the action of the Legislature, recommended the passage of two ordinances providing for the issuing of \$500,000 in water bonds and \$60,000 of South Side sewer bonds. The water bonds will be sold for the purpose of building a new intake and constructing intercepting sewers.

DETROIT, MICH.—The Board of Health has appointed a committee to lay before the City Council a request that an expert be employed to report upon the system of sewerage and its improvement.

VICKSBURG, MICH.—A vote to construct water-works in this place was lost.

GREEN ISLAND, N. Y.—The Sewer Commissioners will soon ask for bids on about five miles of sewers. John L. Fitzgerald, of Schenectady, is the engineer in charge.

CHICAGO, ILL.—Engineer Horn, of the town of Lake, has been instructed to prepare plans and specifications for the erection of a set of pumps for the Water Department, with a daily capacity of 8,000,000 gallons.

COHOSUS, N. Y.—A new 16-inch supply-pipe will be laid from the pumping-station to the new reservoir—6,500 feet. It is estimated that the work will cost \$30,000.

SOUTH PITTSBURG, TENN.—The water-works system is being extended, and about 5,000 feet of new water-mains laid.

SHERMAN, TEX.—A system of sewerage will be built in this city during this year. A system of water-works will soon be completed. The system will be owned and operated by the city.

DECATUR, ALA.—The Decatur Land and Improvement Company signed a contract June 7 with Inman & Co., of New York, for water-works, at \$200,000.

DUBLIN, VA.—A system of water-works is being constructed. For particulars address John W. Lyons.

FERNANDINA, FLA.—The time for receiving bids for building the water-works, previously reported, has been extended to July 15.

GREENVILLE, MISS.—The contract for the water-works at this place has been let to Louis Meteser, and others, of New Orleans. Work is to begin shortly.

GAS, STEAM, BUILDINGS, ETC.

WORCESTER, MASS.—Clark University is being built by Jonas G. Clark, who has given \$2,000,000 to found a university. Architect, Stephen C. Earle.

JERSEY CITY, N. J.—An electric railway is proposed to run between Bridgeton and Jersey City.

NEW ALBANY, KY.—The gas company will extend their works by building a new plant on Bank Street.

INCORPORATED is the Western Natural-Gas Company at Mendota, Ill.

CEDARVILLE, O.—The Cedarville Natural-Gas and Oil Company is a new incorporation.

MINNEAPOLIS, MINN.—The Council Committee has awarded contracts for lighting the streets as follows: For 100 lamps and posts complete to the Wheeler Electric Company, at \$10-75 a lamp; Sun Vapor and Stove Company, 100 lamps and posts complete, \$22-80; Globe Gas-Light Company, 1,000 lamps on city posts at \$18 per lamp. This makes 1,300 lights, an increase of 300 over the present number.

ROCHESTER, N. Y.—The City Council has awarded contracts for lighting the streets. Brush Electric-Light Company, 180 lamps, 2,000 candle-power, the contract to run five years, at 40 cents per lamp per night for the first two years, 28 cents for the next two years, and 27 cents for the fifth year. Rochester Electric-Light Company, 100 or more lamps, 2,000 candle-power, at 28½ cents per night, contract running five years. Edison Electric-Light Company, 700 or more incandescent lamps, 20 candle-power, at 4 cents per lamp per year for the first year, 4½ cents for the second year, 4½ cents the third year, 5½ cents the fourth year, 6 cents the fifth year.

NEW YORK CITY.—The Board of Aldermen have granted franchises to the Mutual Electric Illuminating Company, Theodore E. Otis, President, and the Union Electric Company of Rahway, N. J., E. A. Carman, President.

NEW ORLEANS, LA.—The New Orleans Gas-Light Company has begun an action in the District Court looking to the annulling of the contract with the Louisiana Electric-Light and Power Company for lighting the streets. The gas company asserts that the contract is in violation of law.

POTTSVILLE, PA.—The Town Council acted on the proposals June 7 for street-lighting. None of the bidders, excepting the local company, complying with the advertisement soliciting proposals, which required an exhibit of their respective systems, the bids were not considered.

Further action was postponed until January, 1888, in the meantime the present arrangement with the Anthracite Electric Light and Power Company, of Pottsville, continuing in force. Their rate now charged, and for which they yesterday proposed to enter into an agreement, is at the price of \$104 per annum per lamp (Schuyler system); arc-lights 2,000 nominal candle-power, to be lighted every night during the year from dark until early dawn.

MIDDLETOWN, N. Y.—It is reported that the Standard Oil Company has bought the works and franchise of the Middletown Gas-Light Company, at about \$80,000.

WASHINGTON, D. C.—Newly organized is the Automatic Water-Gas Company, with John B. Alley as President.

HARRISBURG, PA.—The Ridley Electric-Light and Power Company, of Delaware County, with a capital of \$10,000, has been chartered.

OAKLAND, CAL.—Council has taken steps to secure a site for the new city hall, which is to be soon begun. Address Mayor W. K. Davis.

SHERMAN, TEX., will extend its electric-light system.

RAILROADS, BRIDGES, CANALS.

NEWTON, KAN.—The Newton, Attica and El Paso Railroad Company has been incorporated to build 100 miles of railroad.

MILWAUKEE.—The North Harbor Pier has been condemned and C. H. Starke & Co. will tear it down, and for a distance of 600 feet erect new stone-work from the water surface up.

The plans for the new Chicago and North-western Railroad Company's bridge over the tracks at Lafayette Place are completed and have been accepted by the Board of Public Works. A petition will be circulated to raise the grade of the streets leading to the bridge, and when this is done the building of the bridge will be pushed.

TROY, N. Y.—The City Council has ordered the construction of an iron bridge over the Poestenkill at Hill street, to cost \$7,000 to \$8,000.

BRIDGE.—The Secretary of War has approved the plans for a new bridge over Cumberland River at Nashville. The estimated cost is \$100,000. The contract for the superstructure has been given to the Mt. Vernon, O., Bridge Company for substructure, and embankments to John Broderick, of Nashville. E. F. Falconet, of Nashville, is engineer in charge.

RAILROAD.—The Gulf and Ship Island Railway is rapidly constructing its line of road to connect with lines to Chicago. W. H. Hardy, of Meridian; W. C. Faulkner, of Ripley; General Wirt Adams, of Jackson, are directors.

TALLAHASSEE, FLA.—Incorporated are the Eufala and St. Andrews Bay Air-Line Railway Company, and St. Lucie and Lakeland Railway Company.

BOSTON, MASS.—Thomas Lovitt is one of the principals in the New Electric Railway Company, for which a charter was recently granted. It proposes to construct a line to Nantasket Beach.

ALLGHENY, PA.—Heman Clark & Co., of New York City, have the contract for constructing the electric railroad from the City Hall to the Perryville Road. J. J. Houghton is superintendent.

ST. PAUL.—The Board of Public Works has awarded contract for grading Irvine Avenue, from Walnut Street to Western Avenue, to Thornton & Shaw, at \$14,700.

RAILROADS.—A bill is before the New Hampshire Railroad providing for the combination of the Manchester and Lawrence and the Concord Railways into the New Hampshire Railroad. The road is to be under control of the State Legislature.

WALLULA, CAL.—G. W. Hunt, now of this place, has the contract for the construction of a railroad between here and Pendleton.

OTTAWA, ONT.—M. Kemper, representing German capitalists, has made an offer to the Government for the purchase of the Inter-Colonial Railway. The project is part of a scheme for the development of great iron mining and other operations.

NEW YORK CITY.—The Rapid Transit Commission has adopted modified plans proposed by the Manhattan Elevated Railway Company for elevated structure on South and West Streets. The cost is estimated at \$600,000 per mile.

SPRINGFIELD, ILL.—A certificate of consolidation was recorded, June 7, at the office of the Secretary of State, by the officers of the New York, Wheeling, St. Louis and Chicago Railway Company of Ohio, and the New York, Wheeling and St. Louis and Chicago Railway Company of Illinois, for the purpose of forming one corporation for the operation of a railroad from Wheeling, W. Va., to East St. Louis, Ill., and from Lancaster, Ohio, to Fort Wayne, Ind., under the name of the New York, Wheeling, St. Louis and Chicago Railway Company.

CINCINNATI, O.—Recently incorporated is the United Railways Terminal Company, of Cincinnati.

BOSTON, MASS.—It is proposed to build a \$450,000 bridge between Boston and Cambridge.

RAILROAD.—The Georgia Central Railroad is making surveys for an extension to connect with Decatur.

CASTINE, ME.—The Castine and Bangor Railroad has been incorporated. Frank P. Wood, F. H. Drummond, and others, of Bangor, directors.

ASHEVILLE, N. C., June 5.—The charter of the Atlanta, Asheville, and Baltimore Railroad has been turned over to Colonel T. J. Powell, of New York, part of the contract being that the road is to be begun in six months and finished in five years. The line will run from Roanoke, Va., to a point near the Cranberry mines in Mitchell County, N. C., then to Asheville, then to Brevard, and thence to Birmingham, Ala., passing near Atlanta, which will be reached by a branch.

RAILROAD.—The Rockland, Rockport, and Camden Railroad has begun surveys.

THE Mobile and Ohio Railroad has ordered a corps of engineers to survey and locate a line possible between Corinth, Miss., and Birmingham, Ala. The purpose is to have an air line from St. Louis to Birmingham, connecting with Georgia Pacific.

MINNEAPOLIS.—The Council Committee on Bridges will probably report amended plans of the Franklin Avenue bridge over the Mississippi, providing for a bridge with eighty feet head-room over the channel; one through span of 302 feet, and three deck spans of 176 feet each. The estimated cost of the sub-structure is \$58,752, and of the superstructure, \$79,190, making a total cost of \$137,942.

WILMINGTON, DEL.—The contract for building the iron bridge has been awarded to the Smith Bridge Co., of Toledo, at \$15,200.

DALLAS, TEX.—Messrs. A. Davis & Co., of this city, has been awarded contract to build the South-western extension of the Missouri Pacific system, from here to Hillsboro, distance six-seven miles.

BIDS OPENED.

DULUTH, MINN.—The contract for the construction of the Spalding House was awarded to Messrs. Hennessy Bros., Agnew & Cox, of St. Paul and Duluth. The contract price was not made public, but is said to be considerably more than \$300,000.

MONTREAL, CAN.—Hughes & Stephenson have the contract for plumbing and hot-water heating of the new passenger station for Grand Trunk Railroad.

HUNTINGTON, PA.—The Kelly & Jones Company, of New York, have the contract at \$26,000 for warming the Middle Penitentiary.

TORRINGTON, CONN.—The following bids for sewers were received June 7:

L. W. Burt, Hartford, Conn., \$14,047; James J. Cogan, Bergen Point, N. J., \$9,534.40; A. Braxos & Sons, Middlefield, Conn., \$10,740.95; Matthew Kehoe, New Haven, Conn., \$13,133; J. H. Austin, Bridgeport, Conn., \$10,213.20; Franklin A. Snow, Providence, R. I., \$9,933.25; Clark & Byron, New York City, \$7,840.50.

BOSTON, MASS.—The following bids for furnishing white dressed granite for the Suffolk County Court-House were received by the Court-House Commissioners at Boston June 2:

Swett & Davis, Lowell, \$103,000; Cape Ann Granite Company, Gloucester, \$139,000; Hollowell Granite Company, Hallowell, Me., \$105,600; Granite Railway Company, Quincy, \$107,700; Davis Tillson, Rockland, Me., \$85,800; W. S. White, Rockland, Me., \$98,700. The contract was awarded to Mr. Tillson, who is supposed to represent the Hurricane Granite Company, of Rockland, Me. The contract calls for about 45,000 cubic feet of stone.

EAST SAGINAW, MICH.—On June 4 proposals for constructing brick and pipe sewers in certain streets were opened by the Board of Public Works. We give the principal bids: 1,000 feet of brick sewers, 20"x30", John C. Davis, East Saginaw, \$1,200.50; J. P. & A. Davis, East Saginaw, \$2,814.70; Brookes Jackson, \$2,860.50; O'Connor & Nigier, \$2,760.50.

Three hundred and four feet of brick sewer, 30"x45", 350 feet of brick sewer, 28"x42", 510 feet of brick sewer, 24"x37 1/2", 610 feet of 18-inch pipe-sewer, 280 feet of 15-inch pipe-sewer, 300 feet of 12-inch pipe-sewer—all in Brewster street: John C. Davis, \$6,612.22; J. P. & A. Davis, \$5,906.40; T. C. Brooks, \$5,848.40; O'Connor & Nigier, \$5,221.76.

Maple street, 200 feet 23"x33 1/2" brick sewer, 420 feet of 15-inch pipe-sewer, 570 feet of 12-inch pipe-sewer: John C. Davis, \$1,610.40; J. P. & A. Davis, \$1,672.80; T. C. Brooks, \$1,790.80; O'Connor & Nigier, \$1,680.40; Kelly & Lawson, East Saginaw, \$1,790.00. The iron castings, water line, and sewer-pipe will be furnished by the Board of Public Works, the brick and other necessary material to be furnished by the contractor.

ALLEGHENY, PA.—The contract for the rails to be used on Observatory Hill Electric Road has been awarded to the Cambria Iron Co. The plant will cost about \$200,000.

ST. PAUL.—The Board of Public Works has awarded contracts as follows:

Paving—Wacouta street, from Union Depot to Ninth street, to Folsom & Murray for \$15,000; Sherburne avenue, from Rice street to a point 200 feet east of Grant street, to Folsom & Murray for \$9,400; alley in Block 5, St. Paul proper, from Cedar to Minnesota street, to Folsom & Murray for \$500.

Sewers—Sherburne avenue, from Grant to Rice street; Park avenue, from Viola to University avenue; on University avenue, from Brewster avenue to Wabasha, Grant street, from Sherburne avenue to Como avenue; Viola street, from Grant to Brewster avenue, and from Park to Rice street, to F. S. Blodgett for \$12,000.

PENOBSKOT, ME.—The following proposals for the new building of agriculture and natural history were received: C. B. Brown, Bangor, entire work, \$22,100; Lowell & Tibbetts, Bangor, entire work, \$20,500; J. M. Dove, Bangor, carpenter work, \$9,550; William N. Sawyer, Bangor, mason and stone work, \$10,495; J. & J. Philbrook, entire work, \$19,987.

MILWAUKEE.—Bids have been opened for building the new Eighth Ward Fire-Engine House, corner Eighth avenue and Maple street. John Feilenz was the lowest bidder, but as his bid exceeded the appropriation, the contract was not let.

TOPKA, KAN.—The contract for the completion of the State Capitol Building was awarded to George H. Evans & Co., of this city, for \$422,055.28. The only other parties making bids for the entire work were Henry Bennett, of this city, whose bid was \$450,308, and Charles Pierce & Co., of Chicago, at \$478,760. The following made partial bids: Chubbett & Sargeant, Rice & Bassett, J. E. Lane, Sneed & Co., of Kansas City, Terra-Cotta Lumber Co., Haugh, Ketcham & Co., and Variety Iron Works.

NEWARK, N. J.—Six bids were received for the erection of a Soldiers' Home, Newark, ranging from \$52,000 to \$120,000. The lowest bids were those of Joseph M. Smith & Brother, of Newark, for \$72,000, and Henry M. Doremus, of Newark, for \$52,000, to whom the contract was awarded.

HEMPSTEAD, L. I.—The Hempstead Gas-Light Company awarded the contract for furnishing an electric dynamo, etc., to Thomson & Houston, of Boston, and for engine and boiler to Messrs. Hampson & Co.

MONTGOMERY COUNTY, PA.—The following bids for masonry and iron work for Greenlane Iron Bridge, Swamp Creek Iron Bridge, and Jenkintown Stone Arch Bridge, were received by County Commissioners, June 4, 1887: Massillon Bridge Co., Massillon, O., Greenlane Iron Bridge, per foot \$22.50; Swamp Creek Iron Bridge, per foot \$18.50; Groton Bridge Co., Groton, N. Y., \$22.00, \$19.08; West Point Engine and Machine Co., West Point, Pa., \$24.50, \$30; Columbia Bridge Co., \$22.10, \$18.00; Mount Vernon Bridge Co., Mt. Vernon, O., \$24, \$22; Penn Bridge Co., Beaver Falls, Pa., \$22.55, \$17.00; Pittsburg Bridge Co., Pittsburg, Pa., \$25.33, \$23; Doan & Westbrook, New York City, \$26, \$24; Wrought Iron Bridge Company, Canton, Ohio, \$21.70, \$17.20; Morse Bridge Co., Youngstown, O., (ump bid) Plan 1 \$5,617, Plan 2 \$5,469; Plan 1 \$3,322, Plan 2 \$3,223; Standard Bridge Company, Philadelphia, \$18, \$15; John Denithorne & Son, Phoenixville, Pa., \$19.78, \$17.83; Berlin Iron Bridge Company, Binghamton, N. Y. (ump bid), \$5,210, \$3,465.

Masonry.—Willoughby H. Smith, Hendricks P. O., Montgomery County, Pa., Greenlane Bridge, \$1,777; Swamp Creek Bridge, \$1,444; Richard Denithorne, Phoenixville, Pa., \$1,250, \$3,300; Alex. McLean, McLean P. O., Montgomery County, Pa., Greenlane Bridge, \$4,000; Mack & Schwenck, Zieglerville, Pa., Swamp Creek Bridge, \$5,200; William Todd, \$3,930. Jenkintown Stone Arch Bridge.—Richard Denithorne, \$8,900; Hugh H. O'Neill, Jenkintown, Pa., \$4,915; Ellwood Hart, Conshohocken, Pa., \$6,922; Samuel Hart, Conshohocken, Pa., \$5,480; Mack & Schwenck, \$10,990; William Todd, \$7,131.

BALTIMORE, MD.—Contracts for the erection of storehouses, cottages, tenements, etc., at Sparrow's Point, for the Pennsylvania Steel Co., have been awarded to Mr. John G. Coder. Designs were prepared by Benjamin B. Owens, architect.

SCHENECTADY, N. Y.—The following bids for laying new mains were received by the Water Commissioners, June 7: M. Nolan, Schenectady, N. Y., Union Street extension, 6 and 4-inch mains, 2 1/2 cents per lineal foot; Terrace Place, 4-inch mains, 20c.; State Street extension, 8 and 4-inch mains, 20c.; Benjamin Van Vranken, Schenectady, 26c., 20c., 20c., per lineal foot, respectively. The work includes the setting of hydrants, gates, and gate-boxes.

NEWBURGH, N. Y.—The carpenter and brick work for the extension of the County Clerk's office has been given to William White, of Goshen, at \$15,200. J. B. and J. M. Cornell, of New York City, bid \$14,447 on the iron-work, but no action has been taken. Theirs was the only bid. Proposals for heating and plumbing will be asked for.

GOVERNMENT WORK.

NEW YORK.—The following bids were opened at the Army Building, by Lieut.-Col. Henry C. Hodges, on Thursday, June 9, for masonry and carpenter work on the Academic Building at West Point, N. Y.

Bidders: Charles H. Bunn, mason's specification, \$81,280; carpenter's specification, \$27,059; to be completed in nine months. Richard Calrow, for all, \$115,049; to be completed in six months. James L. Lowry, mason's specification, \$87,700; carpenter's specification, \$28,400; to be completed by February 9, 1888. Byrcn K. Bates, carpenter's specification, \$19,750. Lambert Kleits, carpenter's specification, \$30,500; to be completed by September 1, 1887.

No award can be made, as the figures of the lowest bidder exceed the appropriation.

JEFFERSON CITY, MO.—Synopsis of bids for earth, stone, brick and stone-work of approaches to Court-house, etc., opened June 7, by the Supervising Architect of the Treasury Department: William Trippensee, Jefferson City, \$6,700; McCarthy & Corbett, Washington, D. C., \$8,000; David McMerriam, \$8,200; Larkworthy & Menke, Quincy, Ill., \$6,787.

FORT NIAGARA, N. Y.—The following bids for construction of buildings were received by the Quartermaster's Department, June 2:

BIDDERS.	Brick barracks building, complete.	Brick storehouses, complete building.	TOTAL.
John H. O'Rourke, Brooklyn, N. Y.	\$23,945	\$15,400	\$39,345
John Calvert, Youngstown, N. Y.	10,498	8,200	18,698*
John E. Riordan, Youngstown, N. Y.	10,945	8,500	19,445
R. J. Getz, Buffalo, N. Y.	20,754

*Accepted.

PARKERSBURG, W. VA.—Synopsis of bids for hydraulic passenger elevators for Court-House, etc., opened June 7 by the Supervising Architect of the Treasury Department: Crane Elevator Co., Chicago, Ill., \$7,800; Geo. C. Howard, Philadelphia, Pa., \$3,822; Ellisthorpe Air-Brake Co., Chicago, Ill., \$3,070; gas-engine and screw machine in place of hydraulic service, \$2,700.

SYNOPSIS of bids opened June 6, 1887, by Colonel S. T. Abert, for removal of wreck in Rappahannock River, Virginia: John L. Johnson, Fulton, N. Y., \$3,000; William H. French, Norfolk, Va., \$1,195.

LEXINGTON, KY.—Synopsis of bids for masonry of superstructure of Post-Office, etc., opened June 4 by the Supervising Architect of the Treasury Department: The Southern Construction and Quarry Company, Petros, Wayne County, quarry, Oolitic limestone, \$32,551.23; Belknap & Dumesnil Stone Company, Bowling Green, Ky., \$31,000; John Boyle, Cincinnati, Ohio,

Hoosier Stone Company, quarry, Oolitic limestone, \$40,200; Buff Amherst, \$41,587; Indiana Salem Stone, \$40,200; Cleveland bluestone, \$40,108; Ohio River freestone, \$38,064; D. V. Johnson, Hoosier Stone Company, quarry, Bedford Oolitic, \$35,000; Blatz & Krebs, Dork Hollow Quarry, Buff Bedford, \$41,661; Dumesnil Bros., Dork Hollow Quarry, Bedford limestone, \$37,200; John Moore, Dork Hollow Quarry, Bedford limestone, \$55,828; McCarthy & Corbett, Washington, D. C., Dork Hollow Quarry, Bedford limestone, \$40,669; John Diebold, Dork Hollow Quarry, Bedford limestone, \$39,973.

PEORIA, ILL.—Synopsis of bids for joiners' work, wood-flooring, etc., of Post-Office Court-House, etc., opened June 6 by the Supervising Architect of the Treasury Department:

BIDDERS.	Amounts for different kinds of finish.			Rate per sq ft. for Addl Floor-ing.
	White Oak.	Cherry.	Mahogany.	
Truesdale Mfg. Co.	\$31,420.00	\$34,325.00	\$38,685.00	10 1/2 c.
John O'Connor	37,000.00	38,500.00	40,000.00	12 1/2
Cudell & Lehman	33,264.00	35,690.00	38,118.00	12 1/2
John Moore	26,500.00	27,700.00	31,180.00	20
John Mitchell	28,896.81	31,897.00	36,397.00	10
Robert Mitchell Fur. Co.	26,382.85	27,985.85	30,221.85	12 1/2

DETROIT, MICH.—Abstract of proposals for constructing 300 feet, more or less, of elevated walk on pier at Dunkirk Harbor, N. Y., received and opened at the office of U. S. Light House Engineer, Major S. M. Mansfield, Tenth District, Detroit, Mich., June 4, under advertisement of May 16: Walter K. Williams, Dunkirk, N. Y., material and labor of all kinds necessary for building walk at per lineal foot in place, \$1.14; William J. Harris, East Avon, N. Y., \$1.18.

PROPOSALS for removal of wreck of sunken steamboat "Marie A." lying near Charenton, La. Bids opened by Major W. H. Heuer: John H. Gardner, New Orleans, La., \$660; Peter Usner, New Orleans, La., \$875; John J. Atkinson, Houston, Texas, \$575; James C. Bains, New Orleans, La., \$1,850; Samuel W. Skinner, Wilmington, N. C., \$1,800; William H. Brown, New Orleans, La., \$475; Harry Freeman, Franklin, La., \$450; Lewis Anzures, New Iberia, La., \$350; William L. Campbell, Mobile, Ala., \$1,425; William Evans, New Orleans, La., \$600; Victor Von Schoeler, Franklin, La., \$500.

ABSTRACT of proposals for dredging in the Thames River, Conn., received in response to advertisement dated May 7, and opened June 6 by Lieut.-Col. D. C. Houston, Corps of Engineers: Richard Parrott, 355 Broadway, Newburg, N. Y., 36c. per cubic yard; total for 40,000 cubic yards, \$14,400. Hartford Dredging Co., Hartford, Conn., 22c. per cubic yard; total for 40,000 cubic yards, \$8,800. Lowest bid.

TOLEDO, O.—The following bids for dredging at Toledo Harbor, O. (straight channel), were received by Major L. Cooper Overman, U. S. A., May 31. Rate per cubic yard, scow measurement: Stang & Gilmore, Lorain, O., for all the dredging 25c. for a part of the dredging 22c.; J. M. Elvy & Louis J. Seck, Toledo, O., for all the dredging, 24 1/2 c.; William St. John, Toledo, O., for part of the dredging 24c.; Charles F. Dunbar, Buffalo, N. Y., for all the dredging, 27c.; Dodge & Petree, Chicago, Ill., for part of the dredging, 33c.; Charles B. Crane, Chicago, Ill., for all the dredging, 27c.; L. P. & J. A. Smith, Cleveland, O., 24c., 25c.; George Talbot, Buffalo, N. Y., 20c., 21c.; Carlin, Stickney & Cram, East Saginaw, Mich., for all the dredging, 23 1/2 c.; Edwin H. French, Fulton, N. Y., for part of the dredging, 22 1/2 c.

MISCELLANEOUS.

MILWAUKEE, WIS.—The Board of Public Works has opened bids for furnishing the Fire Department with 1,000 feet of 2 1/2-inch hose from A. H. Gardner & Co., H. J. Delaney & Co., American Fire-Hose Company, Richard J. Thomas, and Rundle & Speece, ranging from 68 cents per lineal foot to 90 cents. The bid of 68 cents was for single-body hose, which was thought too high, and the board will advertise for bids making specifications which will exclude single-body hose.

PHOENIX, ARIZ. May 24.—A number of capitalists have combined in the formation of the Arizona Improvement Company, with headquarters in this city. The business of the company includes the taking of water and lands, maintaining and operating an electrical apparatus for lighting purposes, driving machinery, etc., and carrying on the business of banking, merchandising and common carriers. The capital stock of the company is placed at \$3,000,000. The Board of Directors has organized, with the following officers: De Barth Shorb, President; W. J. Murphy, First Vice-President; F. W. Sharon, Second Vice-President; Clark Churchill, Third Vice-President; William Christy, General Manager; C. Churchill, General Solicitor; W. D. Fulwiler, Secretary.

BRAINTREE, June 6, 1887.—The officers of the Baintree Water-Supply Company were to-day served with an injunction prohibiting them from continuing the work of construction of their works, pending the decision of the Supreme Court in the case of the Company vs. the Town of Baintree.—*Boston Herald.*

DULUTH.—The Duluth and North-Western Smelting Works have advertised for 2,000,000 bricks, to be used in the erection of furnaces, etc. It is said that the building of the works will require 15,000,000 bricks.

Building Intelligence.

We solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

ABBREVIATIONS.—b s, brown stone; br, brick; br st, brick store; As duell, brown-stone dwelling; apart house, apart-house; ten, tenement; c, each; o, owner; a, architect; b, builder; fr, frame.

AMONG THE ARCHITECTS.

We report the following from the offices of New York City:

Asheville, N. C.—Brick and stone convent, three stories and basement; dimensions, 83x97; for the Rev. T. Frederick Price; plans are also being prepared for a church and parsonage to be erected on the same grounds; Messrs. Paliser & Paliser, Architects.

Sanesville, Fla.—Presbyterian church; to be of brick and stone; dimensions 72x80; for J. D. Mathewson, President of the Board of Managers; architects, Messrs. Paliser, Paliser & Co.

Jersey City, N. J.—Parochial school, to be erected on Van Winkle Street; for the Rev. B. Ter Woot; dimensions, 50x75; cost, \$15,000; a sisters' house and church are to be erected on the same grounds; Messrs. Paliser, Paliser & Co., architects.

BROOKLYN.—The bids opened by the Board of Supervisors, June 9, for the erection of buildings at the St. Johnland County Farm, were found to be unsatisfactory, as sufficient notice had not been given, and they will be readvertised. A very large sum of money is involved in this matter.

NEW YORK CITY.

111 Madison, br ten; cost, \$11,000; o, Adam Moran; a, George M Walgrove.

204-206 s E 126th, br auction rooms; cost, \$10,000; o, Sarah E Cooke; a, Cleverdon & Putzel.

S e cor Madison av and 109th, br stores and dwells cost, \$5,000; o, Hickey & Brady; a, Zeigler & Wenz.

E s Madison av, 25 s 109th, 3 br dwells; cost, \$34,000 all; o and a, as above.

E s Madison av, 100 s 109th, 3 br dwells; cost, \$52,000 all; o and a, as above.

54-56 E 83d, 4 br dwells; cost, \$9,000 all; o, Fred Cornell and Charles Gulden; a, F A Minuth.

S e cor 9th av and 53d, br dwell; cost, \$30,000; o, Wm B Finley; a, James W Cole.

S s 95th, 80 e 9th av, br ten; cost, \$20,000; o, Francis McQuade; a, A B Ogden & Son.

N s 94th, 80 e 9th av, br ten; cost, \$20,000; o and a, as above.

574-578 Eleventh av, 3 br tens; cost, \$39,000 all; o, Mrs Mary W White; a, Morgan M O'Brien.

MISCELLANEOUS.

BOSTON.—Vaie st, near Thornton, manufactory and storage; cost, \$18,000; o, Dennison Manufacturing Co; a, N Kenway; b, James Fagan.

Batavia, near Falmouth, ten; cost, \$17,500; o, a, and b, David W Thomas.

Falmouth, near Batavia, 3 tens; cost, each \$17,500; o, a, and b, same as above.

32-40 Moreland, 5 dwells; cost, all \$45,500; o, Ariel Low estate; a, J H Bessrick; b, Sampson and Clark.

16-30 Cumberland, 8 dwells; cost, ea, \$9,000; o T A Johnston & J E Potter; a, Fred Pope; b, J E Potter.

30 Magnolia, fr dwell; cost, \$8,000; o, M C Weldon; a, T Frost; b, M C Weldon.

Ravine Lane, near Englewood av, fr dwell; cost, \$16,000; o, a and b, Herbert Mosely.

ALBANY, N. Y.—212-218 N 6th st, 4 3-story brick dwell; cost, \$8,000; o, W R Laufer & Co; a, L S Jacoby; b, Martz & Edwards.

1125 Walnut st, 2 story br cottage; cost, \$7,000; o, Lewis Sourwine; a, L S Jacoby; b, D H Greenwald.

22-24 S 7th st, 2 3-story br dwell; cost, \$7,000; o, Veager & Ruhe; a and b, J M Ritter.

CATASAUQUA.—Howtown Road, br church; cost, \$8,000; o, Ed Lutheran Congregation; a, L S Jacoby; b, Cain Semmel.

MINNEAPOLIS.—S S Sprague & Co, of Providence, R I, will erect business block on Nicollet av, corner 8th st, to cost \$250,000, to be seven or eight stories high. The land has already been bought.

The Board of Education has ordered the following new school buildings: Peabody building, corner Nineteenth avenue south and Two-and-a-half street, 8 rooms; Seward, old fair grounds, 12 rooms; Calhoun, Lake street, near Hennepin, 12 rooms; Everett; rebuilt, 8 rooms; Bremer, Crystal Lake, 8 rooms; Madison, addition of 8 rooms; Pureath, addition of 4 rooms, and the large addition to the high-school building.

ST. PAUL.—Exchange, near 9th, 3-story br dwell; cost, \$10,000; o, H J McCaine

At Arlington Hills, br add to pub school; cost, \$21,914; o, Board of Education.

Winnifred, near Andrew, block 2-story fr dwells; cost, \$10,000; o, Lawton Bros.

At Hamline University, 3-story Hall of Science; cost, \$30,000; o, Trustees of University.

Wabasha, near Bluff, 3-story br store and dwell; cost, \$30,000; o, A Crawford.

Franklin, near 6th, 3-story br dwell; cost, \$10,000; o, J Hammer.

Pleasant, near Walnut, add to public school; cost, \$32,487; o, Board of Education.

Snelling av, near Summit av, add to Macalister College; cost, \$60,000; o, Trustees of College.

South Robert, near Fairfield, 5-story br store; cost, \$12,000; o, J G Brady.

142 minor permits, \$131 200.

ST. LOUIS, MO.—9th and Palm sts, 2 adj br car shops; cost, \$10,000; o, St. Louis Car Co; b, Bothe & Rattermann.

9th and Palm sts, adj br car shop; cost, \$10,000; o, St. Louis Car Co; b, Bothe & Rattermann.

25th and Howard sts, 4 adj br tenements; cost, \$9,000; o, Mrs. H. O'Brien; sub let.

Oliver st and Compton av, 5 adj br dwell; cost, \$21,000; o, J M Wieners; a, A F Rosenheim; b, Francisco & Co.

DEDHAM, MASS.—Work on the new residence of Mr Albert W Nickerson, one of the largest owners of the Atchison, Topeka and Santa Fe R R Co, has begun and will be completed according to plans prepared by the late Mr H H Richardson. The expense of the house will be upward of \$100,000.

ATHENS, GFO.—The Y M C A will build a \$15,000 Association Hall. McGinty & Co are contractors.

LITTLE FALLS, N. Y.—J S Barnett & Bro. will build a new tannery building, 51x114.

NEW YORK CITY.—F E Withers has prepared plans for a pavilion hospital to be erected by the Department of Charities on Blackwell's Island. The cost is \$25,000.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 3. } PUBLISHED EVERY SATURDAY.

NEW YORK, JUNE 18, 1887.

LONDON, JULY 2, 1887.

SINGLE COPIES, TEN CENTS. } IN AMERICA
Subscription, \$4.00 per year in advance, post paid. }
SINGLE COPIES, SIXPENCE. } IN GREAT
Subscription, 20s. per annum in advance, post paid. } BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

LEAVES OF ABSENCE FOR MUNICIPAL ENGINEERS.

WE happened to be, a few weeks ago, in the office of a City Engineer, not a thousand miles from New York, where some members of the city government, having special charge of the Public Works, were informally discussing matters of local interest with the Engineer, who casually remarked that, after several years of uninterrupted work, he was glad to think that a period of comparative inactivity in the prosecution of municipal work would enable him to take a short vacation. He even suggested that, owing to the prospect of construction of some important work, which was to be soon put under contract, it would be well for the city to grant him a leave of absence long enough to enable him to visit other cities where work of a similar character was then under construction; such an inspection would afford him the opportunity to criticise the methods of construction of other engineers, and possibly to give to the city, in its forthcoming work, the benefit of the experience thus acquired.

The preposterous suggestion of a pleasure trip to be taken by a public officer *at his own expense*, while under salary, was evidently too much for the equanimity of the austere City Fathers. Was it not somewhat remarkable that their engineer, appointed or elected for his ability to design and build all their municipal work, should want to procure ideas from others and to spend in such an unheard-of manner the time which should be devoted to the work that he was paid to do? Other remarks from both sides followed, showing that there was very little prospect of an agreement, when the timely suggestion that the intended visit could be made with more profit to all concerned if the engineer was to go on the same trip as the companion and professional adviser of a Committee of the City Government turned the course of the argument, and the great men left, promising to think of the subject.

This little incident reminds us of the fact that very few of our engineers have any chance to acquire, *de visu*, a knowledge of engineering works in other parts of the United States (not to speak of foreign countries). Even the information which they can obtain from written descriptions of distant works is very incomplete. Whether the paucity of adequate descriptions of works of construction is due to the lack of leisure on the part of the superintending engineers, or to the reluctance of some to publish the methods of their practice, it must be admitted that the knowledge disseminated by scientific periodicals and by other engineering papers covers only a limited part of the field of modern American practice.

An illustration of this statement can be found in the diversity of practice which obtains in different districts for the construction of public and other works. Each method has probably its good points, and if engineers had more opportunity to compare the efficiency and cost of all of them, and to combine their best features, they would be able to design and construct better work, possibly for less money. This remark does not apply with so much force to such mechanical and other structures as are generally produced at a limited number of central points, to be distributed all over the country, but they cover many engineering works which originate, and are designed, at the place where

they are to be constructed by engineers residing in the same locality.

There have been lately some successful efforts made to bring together the members of various professional associations for the purpose of discussing questions of interest and of comparing notes; and the result of their stated gatherings has been to secure greater uniformity of practice in various branches of mechanical construction and engineering generally, by giving their members an opportunity to exchange ideas and to visit together works of interest. They have also served to cultivate a better feeling among the members generally, but more individual intercourse between engineers is needed, especially at this time of universal activity in the construction of engineering works of all descriptions.

Municipal and other corporations, when desirous to engage in the construction of works of importance, should favor the practice of giving to their professional advisers ample opportunity to study, by actual inspection, the methods of work used by others, and we firmly believe that this course, if judiciously followed, would result in substantial benefit to the profession and to the community.

POLLUTION OF THE PASSAIC.

FOR the last ten years we have been satisfied that the inhabitants of Newark and Jersey City were at times drinking diluted sewage, and that sooner or later the evil results would become so manifest that public opinion would imperatively demand a change.

Occasionally there have been little spasms of disgust in the form of letters to the press from some citizen pointing out the numerous sources of pollution of the Passaic River, which have been followed by reports, with chemical analyses, showing that the pollution was not so very great; notes on the self-purifying power of running streams, and tables of vital statistics to prove that the health of these cities was fairly good or even excellent.

The reports of expert engineers as to what should be done to improve the water-supply have led to no very practical results, and it seemed probable that a cholera epidemic would be necessary to bring about the required improvement. The *Sunday Eagle*, of Jersey City, has now taken the matter up, and its article is republished in pamphlet form, with a number of appendices, including a report from Professor Leeds, extracts from reports of the State Board of Health and the State Geologist, some comparative vital statistics, and a map indicating the sources of pollution of the river and their relations to the intake for the water-supply of Jersey City. The proof that the Passaic water which is pumped through the water-works of Jersey City is polluted with sewage, factory refuse, dead animals, etc., is given *usque ad nauseam*, but all this is an old story.

The newest part of the pamphlet is that which gives a comparison of the death-rates of Jersey City and of Hoboken for several years before and after 1882, in which year Hoboken changed her water-supply from Passaic River water furnished by Jersey City to Hackensack River water. Before this change was made the death-rates, and particularly those from zymotic disease, were higher in Hoboken than in Jersey City, as will be seen by the following table:

Total death rate per 1,000 of Population.			Death rate per 1,000 from Zymotic Diseases.	
Year.	Jersey City.	Hoboken.	Jersey City.	Hoboken.
1875	25.9	30.5	No report.	No report.
1876	26.8	30.7	"	"
1877	22.3	26.4	"	"
1878	20.7	25.0	"	"
1879	20.3	22.4	"	"
1880	22.4	23.7	5.9	6.8
1881	26.2	20.9	8.0	10.0
Averages	23.5	26.9	6.9	8.4

After the change was made the figures were as follows :

1882	26.0	24.9	7.7	7.7
1883	21.9	21.3	5.2	4.5
1884	21.7	21.1	5.2	3.9
1885	22.8	23.6	5.9	5.4
1886	22.5	22.4	5.5	5.4
Averages	22.9	22.6	5.9	5.4

The improvement in the health of Hoboken does not seem attributable to any other cause than the improvement of the water-supply, and what was good for Hoboken would, undoubtedly, be good for Jersey City.

during a discussion at the Society of Arts, that for the future the society would award its certificates, etc., to the makers and not the sellers of goods. This is a step in the right direction.

Speaking in the discussion of a paper on the new drainage works at the Houses of Parliament, read by Mr. John Phillips, C. E., before the Institute of British Architects, Sir Robert Rawlinson briefly summarized his views of an ideal system of drainage, practicable where a place could be dealt with *de novo*. Every valley line and stream should be rigidly kept as a surface-water channel and outlet; the sewage proper should be intercepted from the valley lines and carried to an intercepting sewer.

An insurance association of a novel character is being established in manufacturing centres in France, and will probably be imitated in other industrial countries. A central establishment, with a complement of medical men and apparatus, is in telephonic communication with the principals of the factories subscribing. On the receipt of intimation from any such factory that an accident has occurred, the

At each rectangle an opening was provided to allow of the raising or lowering of "legs," and in the centre other openings permitted the lowering of the cylinders. When a firm working position was required, the pontoons with the legs standing above the level of the deck, was floated out to the spot, the legs lowered to the bed of the river, and the deck raised on the legs by hydraulic power, and supported thereon by pins. Valves were provided, permitting the ballasting of the pontoons with water, to prevent them floating their legs on a high tide.

SAFETY-VALVE.

OUR SPECIAL ILLUSTRATION.

STAIRCASE, Examination Schools, Oxford, England. T. G. Jackson, London, architect.

OUR VIGNETTE ILLUSTRATIONS.

RESIDENCE OF MR. A. J. HEMPHILL, COMO, MONMOUTH COUNTY, N. J.

THE subject of one of our vignette illustrations this week is the residence of Mr. A. J. Hemphill at Como, Monmouth County, N. J.

HOUSE OF A. J. HEMPHILL, COMO, N. J.—COPE & STEWARDSON, ARCHITECTS, PHILADELPHIA.

It is fairly probable that the pollution of her water-supply costs Jersey City from three to four hundred deaths, and from five to six hundred constantly sick each year.

It is to be hoped that the effort made by the *Sunday Eagle* to have a change made in the water-supply will be successful, and that a skilled engineer will soon be set to work.

OUR BRITISH CORRESPONDENCE.

Restricting the Award of Exhibit Medals—Ideal Drainage—Accident Insurance for Factory Employees—The Tay Bridge.

LONDON, June 1, 1887.

It has long been customary in exhibitions, etc., for jurors to award medals to the exhibitors of articles, irrespective of the fact that the firm or individual exhibiting is neither inventor nor manufacturer. I know of a case where three distinct firms hold the certificate of a certain institute for the same trap. It was recently announced

doctors attend and administer such first aid as is needful. In the event of the accident being slight and necessitating only home attention, the association carries it through to the recovery of the patient. If a hospital case, the association duties cease when the patient is taken to the hospital. The scheme is, of course, established in the interests of employers, not of workmen.

The Tay Bridge approaches completion, and it is hoped by the North British Railway that it will be ready for opening early in July. Certain preliminary tests were made last week when six locomotives and tenders were run on to the centre span of the bridge side by side on the two lines of metals. The centre span is 245 feet, the weight of the locomotives 430 tons, and the maximum deflection 1 3/4 inches. The total length of the bridge is rather over two miles and consists of 85 spans of 50 to 245 feet; clearway between water-line and centre span, 79 feet. For sinking the cylinders of the bridge specially designed pontoons, constructed of tanks, were utilized by Messrs. D. Arrol & Co., of Glasgow, the builders. The dimensions of these floats were 81x66x7 feet, and they carried all manner of apparatus in the shape of cranes, boiler and engines, etc.

Monmouth County, N. J. It is a frame structure, shingled, on brick cellar and foundation. The interior is finished in white pine and oak. The total cost was \$4,088. Messrs. Cope & Stewardson, 212 South Third Street, Philadelphia, were the architects.

TWO WINDMILLS.

We illustrate this week two windmills designed respectively by Architects Edward Lowery Woodruff, of Tompkinsville, N. Y., and H. Edwards Ficken, of New York City. We are indebted to Mr. A. J. Corcoran, of No. 76 John Street, New York, for the use of the photographs from which the drawings were made.

A NEWSPAPER controversy has recently been going on in California between Mr. Andrew Rosewater, C. E., of Omaha, and Colonel George E. Waring, Jr., of Newport, R. I., over novelty of the separate system of sewerage and value of manholes on small pipe sewers.

STAIRCASE, EXAMINATION SCHOOLS, OXFORD, ENGLAND.

T. G. JACKSON, ARCHITECT.

THE BOSTON METER TEST.

By the courtesy of the Boston Meter Commission, the members of the Boston Society of Civil Engineers, and other gentlemen interested in the subject, were given an opportunity, on the afternoon of Saturday, June 11, to see the apparatus devised by the commission, and to learn from the chairman and his colleagues the method which is followed in carrying out the purposes for which the commission was created. The rooms occupied by the commission are at the southerly end of the Mechanics' Building on Huntington Avenue, in the basement. The main room is perhaps seventy feet long and less than half as wide; is divided longitudinally by a railing about waist high, and is well-lighted by windows, which occupy nearly the whole of the upper half of the south wall.

The testing-benches, scales, tanks, supply and waste pipes are all on the south side of the railing, and the other

any plans when made are submitted to the Water Board for approval. The board expressed a wish, too, that the tests should be as public as might be found possible without interfering with the trustworthiness and accuracy of the tests. In conformity with this wish the railing is so placed as to allow everybody to see and hear everything and prevent any outsider from touching the apparatus.

Each meter is subjected in turn to the following line of treatment. It is first tested for accuracy—that is, before any work is put upon it. It is then subjected to a durability test by putting through it, in a constant stream, as much water as would under ordinary conditions be put through such a meter in one year, and this will require about twenty days of constant running. Then the meter is to be subjected to intermittent use for a length of time not exactly stated, and finally is to be put through the same tests for accuracy that were made upon the new meter. After the second test for accuracy, the meters are to be taken apart and carefully examined, the proportions of the parts are to be studied and any evident opportunities for improvement noted.

In detail the tests for accuracy and retardation of flow are quite elaborate.

A gauge is placed on the 6-inch main just as it enters the testing-room, another midway of its length, a third at its end near the testing-tank, and small gauges are placed

MODERN SEWER CONSTRUCTION AND SEWAGE DISPOSAL.

BY EDWARD S. PHILBRICK, MEM. AM. SOC. C. E.

No. VI.

(Continued from Vol. XV., page 516.)

THE Boston intercepting sewers, so far as now constructed, pass along the shores of the South Boston and Boston peninsulas, which they will finally completely girdle, as shown upon the map published in a recent number.

The junctions of the branches of the intercepting sewers with the main are bell-mouthed in form, so that the axes of the two sewers meet by curves tangent to each other; this arrangement occasions the least possible disturbance to the current. Sections of one of these bell-mouthed chambers are given on the next plate. Near each of these junctions a "penstock" or stop-gate is constructed, by closing which the main sewer can be entirely emptied for a while for inspection. When so closed the intercepting sewer would discharge through the old mouths or outlets near where its laterals are intercepted. These outlets are all retained for such emergencies as well as for storm-water overflow under control, and are protected against tide-water by self-acting valve-gates.

The inclination throughout nearly all these intercepting sewers is 1 in 2,000. This slope will, it is expected, afford

TWO WINDMILLS.

half of the room is open and is reserved for spectators. Huntington Avenue carries a 16-inch main, and from this a 6-inch pipe is brought into the testing-room, and runs along directly under the testing-bench. This 6-inch main is about 200 feet in length, and is tapped just after it enters the testing-room by two service-pipes, one an inch and the other three-quarters of an inch in diameter. These service-pipes are carried along under the testing-bench just above and parallel with the 6-inch main to the farther end of the room, where are located the scales and tanks. By this arrangement two services 55 feet in length are obtained, and the average conditions met in practice are in this particular fairly represented. In all the tests for accuracy under the ordinary pressure these service-pipes are used. When a meter is to be tested under different heads, other service-pipes supply water to tanks located on the different floors, and the meters are supplied from the tanks.

For durability tests, sixteen 1-inch taps are connected with the 6-inch main under the testing-bench, and by means of lead-pipe connections a row of sixteen meters can be placed upon the testing-bench and allowed to receive and discharge all the water which they are capable of passing. A drain-pipe of ample size with open branches receives the discharge, one branch for each meter. The chairman of the commission stated that the Water Board of Boston had given no minute instructions as to the method of testing, but had left nearly everything for the commission to arrange for itself, but

at the inlet and outlet of the meter. The commission has chosen the method of measuring out given quantities of water by weight and reading the meter as closely as may be, and by a simple but ingenious electrical arrangement the flow of water is stopped on the instant that the scale tips at the required weight. By an arrangement of tanks and pipes the meters can be made to discharge under back-pressure varying from zero to fifty-one feet.

To illustrate: 10 cubic feet were discharged by a meter through a $\frac{3}{4}$ -inch open pipe into the tank in 3 minutes 30 seconds; with back-pressure of 8 feet in 4 minutes 8 seconds; with back-pressure of 22 feet in 4 minutes 40 seconds; with back-pressure of 36 feet in 5 minutes 32 seconds; with back-pressure 51 feet in 6 minutes 50 seconds; and 10 cubic feet were discharged through $\frac{1}{2}$ -inch opening in 4 minutes 6 seconds; through $\frac{3}{8}$ -inch opening in 9 minutes 58 seconds; through $\frac{1}{4}$ -inch opening in 23 minutes 35 seconds; and through $\frac{1}{8}$ -inch opening in 3 hours and 40 minutes.

The initial pressure under which the meters work can, by the use of tanks, be put at 84, 55, 40, 26, or 8 feet head, and it is proposed by the use of a steam-pump to provide an initial pressure of 200 pounds per square inch for all meters that will stand it.

The commission consists of L. Fred Rice, C. E., chairman, Mr. Charles Carr, a mechanical engineer, and Mr. Leow, an inventor and mechanician.

a velocity of flow that will prevent the deposit of sewage sludge, though not always preventing deposits of sand or road detritus. To provide for this emergency, flushing gates have been built into the large sewers at intervals of about half a mile. Their construction is illustrated by Fig. 15 of Plate IV.

When not in use the gate stands above the sewer in the manhole. The lower part is hinged, and is kept vertical by bolts. When used it is lowered on to its seat and allowed to remain there till the sewage has accumulated to its top. The bolts are then drawn, allowing it to tilt as soon as it is raised from its seat, when the impounded sewage rushes forward. The weight of the gate is counterpoised as shown.

In order to govern at all times the flow of rain-water into the intercepting sewers and prevent an unnecessary quantity from flowing to the pumps in times of storm, the junctions of various laterals with the intercepting sewers are provided with automatic regulators, adjusted to the circumstances of the separate cases.

In the case of the South Boston intercepting sewers, the whole district is so high that the rain-water can be discharged with impunity into the harbor without flooding cellars. The regulating apparatus is therefore in this case applied in the intercepting sewer itself just below its last lateral branch at Kemp Street.

It is illustrated by Fig. 9, Plate IV, and is described by Mr. Clarke as follows: "The apparatus is very simple and consists of stop-planks, closing the sewer from its top

down to about the ordinary dry-weather flow-line, the sewer below the planks being lined with a cast-iron gate-frame or seat, curved to fit the invert, and also vertically to correspond with the curve of motion of a cast-iron valve which plays up and down in front of it. The valve is held by two cast-iron levers, pivoted by a 3-inch wrought-iron shaft in two bearings, the other ends of the lever being connected by vertical arms to a 3-inch square bar. To the ends of this bar are fastened two boiler-plate floats, placed in wells on either side of the sewer. To avoid disturbance to the motion of the floats by waves caused by a rush of sewage under the valve, water is brought to the wells through a 5-inch pipe, as shown, from a point fifty feet below the regulator.

The connection between the valves and the floats can be so adjusted that the former will begin to close when the surface of the sewage in the sewer has reached any desired height. As the floats rise the valve descends until the opening below it is just sufficient to let enough sewage pass to maintain the allowed depth of flow in the sewer. Should the amount of rain-water from low districts, reaching the main sewer through other intercepting sewers, exceed the capacity of the pumps to control it, the main sewer fills and its sewage backs up into the South Boston sewer, and still further raises the floats. The opening under the stop-planks is thus entirely closed, and all of the common sewers above discharge at their old outlets, and continue to do so until the amount of water reaching the pumps can be controlled by them."

South Boston, which are so low that insufficient head-room was afforded for the usual section. These tracks are here depressed some feet below tide-water level, in order to pass under those of the Old Colony Railroad, and are drained by special pumps maintained by the Railroad Company.

The diameters and cost of various sections of these sewers, under different conditions, is thus given by Mr. Clarke:

Size.	Thickness of Walls.	Average Depth below Surface.	Cost per Foot.	Material in which it is Constructed.
6 ft.	12"	20 ft.	\$12.68	Clay and sand.
5' 6" x 4' 9"	8"	24 ft.	13.35 to 16.85	See Fig. 10.
5' 7"	24 ft.	26.16	Piles used in mud.
4' 6" x 4' 8"	21 ft.	11.97	Clay.
4' x 4' 6"	10.10

(TO BE CONTINUED.)

THE FUTURE FOR ENGINEERS.

IN his inaugural address as President of the Society of Engineers, Professor Henry Robinson refers to a prevailing fear that opportunities for professional work are falling off, and that the future for engineers is not encouraging, saying that he does not believe there is any ground for such gloomy views. He says: "Having myself, during the last twenty-five years, passed through three periods of profound depression in trade, entailing a like feeling of anxiety and doubt as to the future of professional work, I have a vivid recollection that these dark periods were followed by times of great prosperity. The interval between

BUILDING CONSTRUCTION DETAILS.

No. V.

BALLOON FRAMES.

(Continued from Vol. XV., page 544.)

THE old adage that necessity is the mother of invention has been illustrated in many ways in the various building operations which have been carried on in the Western States. The greater portion of our mechanical and building methods have naturally been derived more or less directly from English ideas, and in the East these ideas have always prevailed. In the West, however—and the term West includes the country even as near at hand as western New York—lack of time, a desire to build as cheaply and with as few mechanical appliances as possible, and doubtless a lack of skill on the part of the mechanics available for ordinary building operations, have led to certain innovations of the Old-World usages. In the West the great demand has always been for small, inexpensive houses, and the amount of material and labor involved in their construction has been reduced to the lowest possible degree by the adoption of what has been very suggestively termed the balloon frame, a system which differs considerably from the ordinary post and girder frame, while possessing many points in common with it, and which is worthy of a little serious study and comparison with the older method.

Any man who knows how to use a hammer, a square, and a saw can call himself enough of a carpenter to build a house with a balloon-frame, for those are the only tools used. Figure 1 is a diagram sufficiently extensive to illustrate this construction. It must be remembered that in the West, lumber is usually obtained from a yard, and only regular sizes and dimensions can be had. The ordinary foundation-walls are of brick, eight inches thick. On this is laid a 2x8-inch timber as a sill, the corners being halved and spiked together. The studs are cut a uniform length, and are set up on the sill, being simply toe-nailed thereto, with no tenoning or framing whatever. The studs are all 2x4 inches. They are doubled at all corners and each side of all openings, but none of the openings are framed, the studs being commonly spaced along the whole wall, sixteen inches on centres, without regard to doors or windows, the opening being cut out and the side studs doubled after the floors are all laid. A 2x4-inch plate is nailed on the top of the studs as a tie and to support the rafters and ceiling beams, which are more often arranged as shown by the figure, though in some cases where attic space is not required the rafters rest on the 2x4 plate between the ceiling beams, to which they are nailed. In the present instance the ends of the ceiling beams are cut down two inches and a 1x6 board nailed across the tops of the beams to support the rafters.

The floor-beams, usually 2x10 inches for spans of less than twenty feet, are spaced to correspond with the studs. This is an essential element of the construction, and all chimneys, stairs, etc., inside of the house must conform thereto. The first-floor beams rest directly upon the 2x8 sill and are nailed twice against the sides of the studs. The flooring is carried out between the studs, and in the better houses it is customary to fill in over the flooring between the studs with three courses of brick to keep rats from rising in the wall. To support the second-floor beams a 1x6-inch strip, generally known as a ribbon, is let in flush with the inner face of the studs and the floor-beams are notched one inch over this, besides being nailed to the studs. The construction at the ceiling has been previously explained. The rafters are usually no more than 2x6 inches and are spaced twenty inches on centres across the entire roof. There is no doubling of the rafters in any case except for weak valleys, and as the rafters are laid out so as to butt exactly against each other, the ridge is dispensed with, the heads being nailed together, while the feet are toe-nailed to the plate or to the 1x6 band. And, finally, all roofs and walls are covered with 3/4-inch boarding, nailed twice to each stud and rafter.

If construction is to be considered as a scientific operation involving careful planning and exact workmanship, the balloon frame becomes mere ignorant child's play unworthy of notice. But if the proof of the pudding is in the eating; if the end justifies the means; if it does not matter how a building is constructed, so long as it is light, strong, and durable, then the balloon frame is one of the neatest of adaptations to necessity and circumstances, and deserves a better name than is usually given to it. That it does produce a stiff, staunch building cannot be denied, for nowhere do the winds have the force and the velocity they acquire on the Western prairies, and yet the average

PLATE 2

When no regulation was needed to govern the amount of water to be received from a lateral sewer the connection was made as shown in Fig. 7, which illustrates the junction of Vale Street sewer as a type of this kind. The section of the intercepting sewer appears below, and the lateral sewer, with its manholes and tide-gates, above.

Figure 5 shows the short piece of iron pipe built into a sump in the bottom of the lateral sewer, with a cast-iron flap-valve, generally kept open. One or more of these was used, as occasion demanded, to conduct the water from the bottom of the lateral to the interceptor.

The tide-gates are hinged to cast-iron rings, (see Fig. 8,) built into the brick-work. The gates are inclined so as to be self-closing, and have rubber bearings to insure tightness. Figures 1, 2, 3, 4, 10, 11, 12, and 13 illustrate the various forms and methods adopted in constructing the intercepting-sewers, according to the circumstances of the case. The form shown by Fig. 2 was used only where passing under the tracks of the N. Y. & N. E. R. R. in

the two periods lead many to abandon the profession, either from inability to wait for better times, or from an erroneous notion that those better times would never come. My own experience has led me to think that probably most of those who discarded their profession in this way were really not fitted for it, or had no real love for it."

The cause of failure in the profession, he thinks, is usually defective training. "Many youths are sent almost direct from school into workshops, whilst, on the other hand, many pursue their theoretical studies apart from opportunities of observing the practical application of their knowledge. In both cases an important factor in the formation of an engineering training is wanting. In the former the youth may become a skillful mechanic, but will lack breadth of knowledge to fit him for a profession which has pre eminently to deal with large subjects extending over a wide range of thought. In the latter the youth is wanting in the leaven of practical knowledge. I do not consider it possible in any educational establishment to impart to and impress upon the mind the results of the matured experience of actual practice, although a considerable approach to it can be accomplished."

Western house is about as free from jars or bulged walls as the average dwelling about New York or Boston. The whole secret of the stiffness of the balloon frame is in the thorough boarding of roofs, walls, and floors, tying the whole so effectually that there is no chance to give in any direction. Nails may not be as sure and lasting factors of resistance as wooden tenons, but they are much cheaper, and where time and money have to be considered as carefully as they are in the West, the balloon frame can hardly be condemned on any just grounds.

For purposes of comparison, a diagram is given herewith of the ordinary post and girder construction. Figure 2 will be of interest to those readers of THE SANITARY ENGINEER AND CONSTRUCTION RECORD who are more familiar with the other method. It will be seen that whereas in the balloon frame each stud bears its share of the burden, and is an essential element of the construction, with the post and girder system the sill, the corner-posts, the girts, and the plate constitute the frame by themselves, being braced firmly by the diagonal pieces, and made of sufficient strength to alone sustain any ordinary strain that would act upon the wall, the 2x4 studs acting only as a filling to the skeleton. The stiffening powers of the floor, wall, and roof boardings are not considered as elements of strength, or at least are not relied upon, and all of the principal pieces of timber are tenoned together. There can be no doubt that this is a much more scientific, workmanlike and enduring construction than the balloon frame, and should be used in all cases for houses of any size, but

EXAMINATION OF THE ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.

THE third examination carried out under the auspices of this association took place on Friday and Saturday, the 22d and 23d of April, at the Institution of Civil Engineers, Great George Street, Westminster, on which occasion nineteen candidates presented themselves for examination.

The written and graphic portion of the examination occupied the first day. The *viva voce* being taken on the second.

The examiners were: Mr. J. Lobley, M. Inst. C. E. (President of the Association), Borough Engineer, Hanley; Mr. W. G. Laws, M. Inst. C. E., City Engineer, Newcastle-on-Tyne; Mr. E. B. Ellice-Clark, M. Inst. C. E., County Surveyor, Sussex (West); Mr. H. P. Boulnois, M. Inst. C. E., Borough Engineer, Portsmouth; Mr. Lewis Angell, M. Inst. C. E., Borough Engineer, West Ham.

The following are the papers set at this examination: **SUBJECT:—Engineering as Applied to Municipal Work—W. George Laws, M. I. C. E., Examiner.**

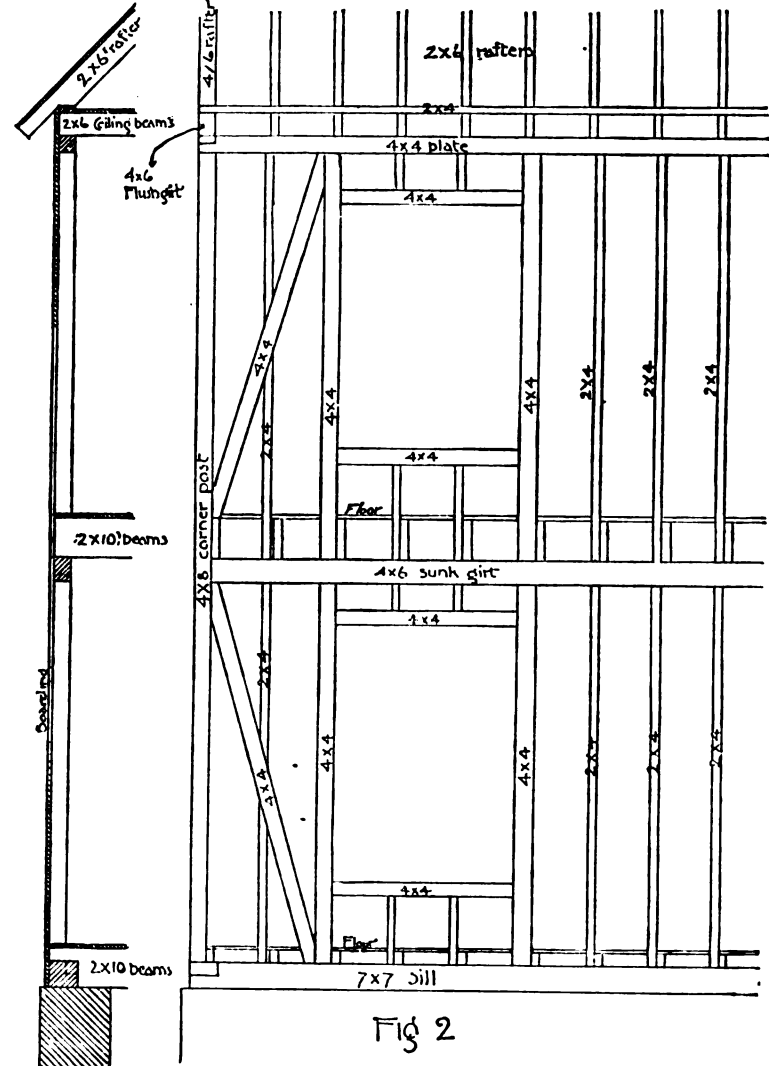

1. How are the lines of a chain survey fixed in position, and how is the correctness of the work tested? What is meant by "tying" the lines? Give a sketch.
2. How would you find the relative levels of a sloping field, say for laying it out for streets? What instruments are used, and how?

1. Under what conditions would you construct inverted arches in a building—and what purpose do they serve?
2. Sketch some different forms of dowels used in masonry. Show the position of a kneestone in a wall.
3. Under what conditions would you lay masonry or concrete blocks in diagonal bond?
4. State Tredgold's, or other rule, with diagram, for proportioning the various parts of a scarf [having regard to the strength of different timbers] to resist tensional, compressional, or shearing force respectively.
5. What considerations determine the form of truss or principal for a roof of a given span?
6. Sketch the principal of a roof, not iron, for a span of 26 feet, where a tie-beam is inadmissible.
7. What do you consider the best method of forming a fire-proof floor for a warehouse? State the advantages and disadvantages of arched floors.
8. What is meant by sheet-lead "crawling," and under what conditions will this happen?
9. Write a short specification for flat roof to be covered with zinc, giving such sketches as you consider necessary.

SUBJECT:—Sanitary Science.—Lewis Angell, M. Inst. C. E., Fellow King's Coll., London, Examiner.

1. What are the component parts of—
(a) Pure Atmospheric Air?
(b) Pure Water?

What are the usual sources of contamination in a dwelling-house?

for cottages, stables, and ordinary light constructions, it is a question whether the advantages of a post and girder frame would be commensurate with greater cost as compared with the Western method.

It may be of interest to consider just how much more expensive one method is than the other. A section of wall framed like Fig. 1 contains 171 feet of lumber, and would require about 133 nailings. The only fitting would be in connection with the two ribbons. The portion of frame shown by Fig. 2 would contain 283 feet of lumber, have practically no nailings, but each beam in the first floor has to be gained into the sill, and there would be at least fourteen mortises and tenons to cut and fit. The diagonal braces and the window heads would offset the fittings of the ribbons in the balloon frame. We will assume the rafters and the beams equivalent in each case. The post and girder frame requires more care in setting, and we can only approximate the difference in labor, probably not over thirty per cent. more than the balloon frame. Figure 2 requires, as we see, quite sixty-six per cent. more lumber than Fig. 1, and the difference would actually be much greater for the entire house, for timbers as light as 2x6 for ceiling beams and rafters would seldom be used in the East, and 20 inches would be considered too wide a spacing for the rafters. Whence it is fair to assume that the balloon frame can be put up for one-half the cost of the ordinary post and girder construction.

3. What is a syphon, and how may it be used in carrying water from one side of a dam to the other? What conditions are essential to its action? Give an instance you know of its use in main drainage.

4. What is meant by "Hydraulic Mean Depth," and how is it calculated? What is the H. M. D. of a trough 12 inches square running full?

5. Describe the mode of "laying" and jointing an ordinary street sewer-pipe, and the use of "boning-rods" in securing uniform fall therein.

6. Sketch and describe an approved manhole and its proper position and uses in a system of sewers.

7. When are brick sewers to be preferred to pipes, and what is their best shape? Sketch section of and specify very briefly for a length of brick sewer.

8. Describe and illustrate the mode of forming a reservoir dam, showing how it is made water-tight, and the precautions to be taken against leakage, and damage by overflow.

9. Calculate the strain per square inch on the metal of a pipe four inches diameter, and one-half inch thick, under a head of 300 feet of water-pressure.

10. Mention some of the chief systems of wood paving. Specify briefly for one of them, and state where it is applicable, and why.

SUBJECT:—Building Construction, etc.—E. B. Ellice-Clark, M. I. C. E., H. P. Boulnois, M. I. C. E., Examiners.

2. How many cubic feet should be allowed for each adult in a sleeping-room?

3. What natural conditions and structural precautions are necessary to secure a healthy site for a dwelling?

4. Sketch a section of a house of three stories, showing—
(a) A sink on ground floor.
(b) Water-closet and bath on first floor.
(c) Water-closet on third floor.

and show, distinctly, the water-tanks and entire method of drainage, trapping, sewer connection, and ventilation.

5. What proportion in sectional area should the ventilating-pipe above a water-closet bear to the soil-pipe below?

6. Describe a practical test to discover any hidden defects in a house-drain as to jointing, trapping, etc.?

7. For what quantity of rainfall in 24 hours is it usual to provide in a main sewer, and how many cubic feet per head of the population would you provide for in a water-carried system of sewerage?

8. State the advantages and disadvantages of a duplicate system of drainage for the separation of rainfall from the sewage?

9. State, generally, what are the methods adopted for the purification of sewage at the outfall, and describe some one chemical process, its mode of operation and results.

SUBJECT:—Public Health Acts and Rivers Pollution Acts.—Joseph Lobley, M. Inst. C. E., Examiner.
This examination was confined to a knowledge of these acts.

IRRIGATION REGULATION IN COLORADO.

THE third biennial report of the State Engineer of Colorado, which deals largely with irrigation problems, shows very forcibly the great importance of State control to regulate the use of water and prevent its waste. The State has adopted an excellent system of laws, and the engineer refers with pride to the favorable interest manifested towards it by other States, and even by the Parliament of Australia. Like all new laws, these have had to be put in operation in opposition to the prejudices and selfishness of those who had been using water wastefully, and without law.

The laws require proper measuring flumes and head-gates to all ditches, but these provisions are not always obeyed, and the engineer has not the authority to *oblige* their introduction.

The old method of measurement by the inch has been introduced in many of the decrees and leases of water right, and is still the legal measure. On account of its uncertainty it is desirable to have the cubic foot as the standard. The equivalent to this is stated by one Commissioner as "38 $\frac{1}{8}$ statutory inches." Among other recommendations, Mr. Nettleton desires that police power be given the Commissioners to arrest all persons guilty of changing head-gates or otherwise violating the laws; also, for protection to the Commissioners while performing their duties; also requiring all appropriators of water to prove up their rights and obtain a judicial decree defining their rights. One difficulty experienced, has been the lack of a competent authority to decide questions as between various drainage districts, and a law is asked creating a board of water commissioners for this purpose.

Another requirement constantly mentioned in the Commissioners' report is a self-registering of the heights of water at the intakes to the canals, for the purpose of giving a continuous record of the flow. By this means it is hoped to gain more exact data for the determination of the vexed question of the "duty" of water.

The various Commissioners report a decided increase in duty since the opening of the ditches as an effect of "seepage" through the soil. In the Cache la Poudre district for the season of 1886, the duty "was about three times as large as the estimate heretofore generally accepted, the average for May to August, inclusive, in District No. 3, 193 acres per foot discharged per second; 200 acres are mentioned as not unusual in Utah, and still more in California.

The year 1886 was one of great scarcity of water, the whole amount discharged in the irrigating season being less than that for the month of June, 1884. For that reason the commissioners were called upon to adjudicate upon the amount flowing to each taker, adjust the head-gates, etc., in many cases, and toward the close of the season the supply was reduced to that for domestic use only.

In extreme cases, this was given on alternate days only, so as to eke out the supply.

As all this has to be done with a due regard to priority of rights, it will be seen that the duties of a commissioner are often of a very delicate nature, and the pay vouchsafed (\$5 per day only) for the short time engaged is not, it seems to us, sufficient for such services. The office ought certainly to be a permanent one, so that the occupants may become skilled in their duties, and their services more valuable on account of experience gained.

The question of seepage is a very important one, of which an interesting example was given some time since in our columns, and some ditches have been built which depend entirely upon this for a supply.

Near the close of this interesting report is a discussion of the growth of husbandry in the State. The earlier settlers planted only wheat, but now other grains and small fruits and vegetables are cultivated extensively, and the introduction of vineyards and orchards is rapidly progressing. By a careful attention to the varieties of fruit introduced, the apple has been successfully cultivated up to heights of 8,000 feet, and pear, plum, and cherry trees are in bearing up to 6,500 feet in La Plata County.

A great deal has been said about raising good crops *without* irrigation. On this point we quite agree with a quotation given from a private letter. "You may add as an axiom, that no crops of grain are raised anywhere in the State of California with a less rainfall than ten inches, and that *good crops* are only the result of twelve to fourteen inches rainfall and upward. We have not yet discovered

the secret of making vegetation grow in dry land without irrigation. Since heavy rainfalls have made grain-growing possible almost anywhere in the arid region, the impression has been spread abroad that irrigation is unnecessary, but a few normal seasons will speedily correct this impression."

The report takes up the question of reservoirs as a means of storing water in times of scarcity; and points it out as worthy of encouragement by the State. One of the commissioners discusses briefly the question of the diminution in flow as affected by the general destruction of the trees, but the statistics are too meagre to base any certain conclusions upon. It cannot be doubted that the effect of the wholesale deforesting of the mountains will be very disastrous to the whole country.

RISE OF WATERS OF THE NILE.

THE following table, drawn up from a report of Colonel Moncrieff, resumes the observations of more than a century and will show the enormous variations which take place in the rise of the waters. In the period of 126 years the Nile, at Cairo, has been marked:

5 times at.....	25 pies or.....	m.
24	24	20.12
24	24	19.58
28	24	19.04
21	22	18.50
19	21	18.27
17	20	17.96
11	19	17.60
4	18	17.42
1	17	17.15

A rise which surpasses 25 pies is dangerous; it may cause a rupture of the dykes or an inundation. From 20 to 23 pies the rises are moderate, and the best years are those when they are between 23 and 25. When the level does not attain 20 pies, certain regions, where the soil is high, cannot be watered. In 1877, when the Nile did not reach 18 pies, a famine ensued throughout the country. The advantage, therefore, of regulating the resources of the river is apparent. In order to profit by the overplus of water at the time of the flood it would be necessary to construct a series of immense reservoirs in the meridional regions of the Valley of the Nile at different levels, capable of storing enormous quantities of water at the time of the flood, to be repaid to the river at low water.

Some years ago M. de la Malte formed a company under the name of "Société d'études du Nil," which appointed M. Jacquet—engineer-in-chief of roads and bridges—to make an especial study of works to be undertaken in Upper Egypt. To this end he explored that part of the country in conjunction with M. de la Malte; and on his return in 1882 published a learned report on the subject.

M. Jacquet proposes to create the first reservoir at Gebel Selseleh. On quitting Assuan in descending the Nile, the river runs for a distance of forty kilos. in a valley closed in on both sides by mountains. The two chains then branch off almost suddenly, leaving the vast plain of Koum Ombas between them, which extends as far as Gebel Selseleh, a distance of thirty kilos. At this point the two chains again run close together, and the Nile traverses a defile of 400 metres in width, forcing its way through the rock as if it had been cut through to give it passage. To the east of this defile there is an opening of 1,800 metres wide in the Arabic chain, which was once evidently the bed of the Nile. At no very distant period the rocks formed a ridge which held back the waters, and thus formed by their deposits the plains of Koum Ombas and Amangar, of heights not now reached by the highest floods. M. Jacquet considers that the plain above the passage of Gebel Selseleh is marvelously situated for the creation of an immense reservoir. It would form a vast circle, shut in on all sides, 30 kilos. long by 50 kilos. broad,—in round numbers, a superficial area of 120,000 hectares. In his rapid survey, M. Jacquet was only able to take certain levels, but he estimated that of the plain as lower than the water mark at Gebel Selseleh, so that as soon as the waters attained 20 metres the whole of the plain would be flooded and every metre raised in this basin of 120,000 hectares would correspond to a store of 1 milliard 200 million cubic metres of water, taking into consideration the capacity of the river's bed as far as the top of the first cataract.

In the first instance, the present bed of the Nile would have to be dammed up in order to raise the level in the reservoir; the old bed situated to the east, as before mentioned, would also have to be barred. It would then be necessary, naturally, to provide a fresh opening for the river; this would be done by opening up two new arms, one serving as a discharge, being 700 metres wide, would be dug to the west of the old bed of the river, while the second, only 300 metres wide, would open into the lower plains and run at the side of the Nile, being, at the same time completely separated from the present bed. Independently of these two branches there would be constructed, firstly, a navigation canal with a series of locks; secondly, an irrigation canal capable of discharging 500 cubic metres per second. Supposing the maximum retention to be 25 metres above the water mark, the lower surface of the waters in the lakes being fixed at 20 metres, seven milliards cubic metres of water could be accumulated, and restored to the Nile during the low-water period.

The first result would be to remove all fear of inundations when the rise of the waters was excessive. As soon as any indication of a flood was perceived, the reservoir could be emptied, and such quantities of the rising water drawn off

as would be necessary to avoid any overflow into Lower Egypt: in fact, the capacity of the reservoir would permit 4,000 cubic metres per second to be drawn off during more than twenty days. On the other hand, when the rise was likely to be insufficient, progressive stores could be made during the ascending period, beginning from the month of July, so as to have the reservoir completely full at the time of the flood. At this point a gradual opening of the reservoir would permit large quantities to be poured into the Nile for a considerable number of days, so as to lessen in a certain measure the evil of an insufficiency. The irrigation canal would besides, according to the project, bring under cultivation a superficial area of 400,000 hectares now lying waste.

The estimated expense for carrying out this project is 100,000,000 francs. Numerous objections have been made to the plan of reservoirs. Losses would occur of the waters of the lake through infiltration and evaporation, it has been stated, and the basin would become choked with slime. These objections have all been satisfactorily disposed of by M. Gallois Bey, to whose report on the question we refer all those who are interested in the matter.

The Government of the Khedive is convinced of the importance of the proposed works, and the Minister of Public Works is concentrating all his efforts toward their accomplishment. There is every hope, then, that the time is not far distant when the country will benefit largely by their realization.—BOGHOS NUBAR, in *The Engineer* (London.)

TENTH ANNUAL REPORT OF THE BOARD OF HEALTH OF THE STATE OF NEW JERSEY.

THE report on vital statistics for the year ending June 30, 1886, which is contained in the tenth annual report of the State Board of Health, does not give death-rates either for the whole State or for parts of it. The birth-rate is stated at 20 per 1,000, which indicates that the returns are very imperfect.

The total number of deaths during the year is given as 22,734, which would seem to indicate a death-rate of a little over 17 per 1,000, which is comparatively low.

The great defect in this part of the report is that there is no study of deaths by localities, to show where there has been improvement or the reverse, or where there are indications of special need for sanitary efforts.

Among the numerous papers and essays appended to the report, one of the most valuable is that by Dr. J. W. Stickler, of Orange, on the diseases of hatters, and it is so because he actually investigated the matter for himself and gives us some definite facts, instead of general advice and quotations.

He found that the most common disease of hatters is catarrhal inflammation of some part of the air-passages, and that consumption is a more frequent cause of death among them than among most other workmen. How much of this is due to true tubercle and how much to dust deposits in the lungs seems to be unknown.

Beyond mere allusions to the fact of its existence, Dr. Stickler seems to have paid no special attention to the mercurial poisoning which is so marked a feature among the diseases of hatters.

The other essays in the book are devoted to popular instruction on various sanitary topics, such as sewerage, water-supply, gas, etc.

The paper on poisoning by new milk, which was published by Dr. Newton in the *Medical News* of September last, is reprinted with some additions. This refers to a number of cases of sickness at Long Branch in which vomiting, diarrhoea, and collapse were produced by the use of milk in which Dr. Newton found the poisonous substance known as tyrotoxin, and which seems to have been developed in the milk in the short space of five hours. Dr. Newton thinks that this was due to the fact that the milk was placed while warm in tight cans and shipped at once for market without having been first cooled. If this were the case it should be easy to prove it, for any milk enclosed while warm in a tight can or bottle should develop the same product. This we doubt strongly. There is reason to believe that some specific micro-organism was concerned in the production of the poisonous substance, and it is to be regretted that cultures were not made and the matter thoroughly worked out.

Taken as a whole the report is an excellent educational document for distribution among the people.

THERE is considerable prospect of the establishment of plumbers' classes in Montreal next autumn in connection with the Government schools.

CARRYING WATER-MAINS ACROSS A RIVER.

At the recent meeting of the Michigan Society of Civil Engineers, Mr. W. R. Coates read a paper describing the method used by him to carry the water-mains for Grand Rapids across the Grand River, which we abstract as follows:

"I first removed," he says, "the old wrought-iron main, and then cleared away the slight accumulation of sand, gravel, and fragmentary rock for a space of about six feet in width on the line the new main was to occupy, and entirely across the river, thus exposing the naked limestone rock. A false work was then constructed directly over the line and entirely across the river. This false work was composed of about seventy trestles placed at intervals of twelve feet, or one trestle to each length of pipe; these trestles were connected together in such manner as to make a good working bridge from which to prosecute the work. The chief purpose of this false work was to serve as a temporary bridge on which to put the line of main together, and from which to lower it to place in the bed of the river; but it also served an excellent purpose as a base from which to conduct the trenching operations. This bridge was eight feet in height, and ordinarily projected from two to four feet above the water, although at times the water was up to the floor-plank.

"The plan adopted for making the trench for the main was, first, to clean off the sand and gravel, as already described, thus exposing the naked rock, then to drill holes at intervals of two feet on the centre line of the proposed trench. These holes were carried to a depth of about thirty inches, and after being completed, were each charged with a ½-pound cartridge of Hercules powder. These charges were prepared in clusters of six, and exploded with electricity, a small dynamo being used for the purpose. Inserted in the upper end was an exploding cap, attached to which were two insulated copper wires, of sufficient length to reach above the water, where they were connected with wires leading to the dynamo. This dynamo was of sufficient power to explode the six charges simultaneously, and could be easily moved from one point to another, as occasion required, and it was not necessary to station it more than fifty feet from the blasts. It was not difficult to so adjust the charges as to secure the desired execution, without disturbing the false work. This very greatly facilitated operations, as without the false work for a working base, a very great amount of time would have been lost in getting to and from the work. The blasts did the best execution when the drill-holes were slightly inclined from the perpendicular. In charging the blasts the cartridges were inserted in the drill-holes and forced to the bottom with a long rod. The overlaying water proved to be sufficient packing to secure the desired execution without sand-tamping, and at the same time leave the false work free from danger from flying rock, as the rock though sufficiently broken up to permit of easy removal, still remained in the trench, from which it was simply raked out upon the sides until after the main was laid, when it was raked back again into the trench and over the pipe, heavy, long-handled hoes being used for this purpose. The trench when finished was in most excellent form to receive the main. From each side of the river toward the centre the bottom of the trench sloped gradually for 300 feet, the entire fall being only one foot, while the middle section of 200 feet was a true level. It is very rarely, indeed, that we can obtain such an even grade entirely across so wide a river.

"After the trench was complete and in readiness, the pipe was put in place upon the false work and joined together preparatory to lowering to place in the bottom of the river. The pipe was of cast iron, in 12-foot lengths, each section weighing 1,500 pounds, and of the pattern known as socket and spigot-joint pipe. The pipe was coated with Dr. Angus Smith's patent varnish, and the joints were made of hemp, gasket, and lead. I gave the joints the greatest depth of lead the socket would permit, in order to secure the highest degree of lateral stiffness. In putting the line together on the false work it was so put together as to conform to the shape of the trench bottom, so that when lowered to place the main would come to a bearing on the trench bottom simultaneously throughout its entire length. When the main was all in place on the false work, and the joints all made, chain-slugs were attached to it at intervals of twenty-four feet, or each alternate section of pipe, and to these chain-slugs were attached screw-rods one and one-quarter inches in diameter and nine feet long. These screw-rods were each provided with a double hook at the lower end, and to these the chain-slugs were attached. The rods, passing up through a heavy, supporting cross-timber, were

held in place by nuts, with lever extensions for turning them. These chains and rods were of proof metal, and capable of carrying sixteen times the load that was placed upon them. I provided this very large safety factor in order to be prepared for every possible contingency. While it was not at all probable, yet it was possible, we might not be able to secure equal duty along the entire line in lowering the main. Of course, if one chain and screw, from any cause, failed to carry its proper load, its neighbor would be overloaded.

"After the slings and screws were all attached, the two shore ends of the main were plugged and braced, and the main filled with water and subjected to a test-pressure of 140 pounds to the square inch. The result of this test was satisfactory to all concerned. After this test the water was drawn from the pipe, as it was deemed best not to carry this extra load in lowering the main to place.

"All was now in readiness for the grand climax of the entire work. In a few short hours we were to know, from actual, practical demonstration, whether our plans were to prove a success; whether our theory and our practice would prove harmonious. The work had been observed with deep interest by the Board of Public Works and by the citizens of Grand Rapids, and very naturally there were many doubts and fears concerning its successful accomplishment.

"The prevalent fear seemed to be that it was impracticable to handle so lengthy and heavy a line of pipe all at once, and that even if this could be done, it would be impossible to resist the force of the current when the line became fully exposed to it. From my own point of view, I had considered all serious obstacles overcome when the rock-trench was completed, and that lowering the pipe to its place in the bottom of the river would be a mere play spell. And so it proved.

"Of course, I had carefully calculated the requirements of the situation, and the means requisite for handling the main, and for resisting the force of the current, and had provided amply for any and all contingencies. And this was not a difficult matter at all; there were no unknown quantities involved; everything could be mathematically demonstrated, almost as easy as two and two make four. If fifty feet of pipe could be handled safely all at once, five miles could be handled just as safely, if everything was proportioned and timed correctly. As to the great bugbear, the current of the river, five minutes' ciphering clearly demonstrated that gravity alone gave an ample factor of safety, the simple weight of our main being such that the current would not affect the line in the slightest degree. These fears and doubts proved quite a disturbing element, however, with many who were very greatly interested in the success of the work, and they were not allayed until the work was fully completed, and they were shown to be entirely groundless.

"Forty men were now stationed along the line of main, one at each screw, and a signal-man with a horn was placed in the centre. At intervals of ten seconds the signal-man gave one blast with his horn, upon which the men at the screws each gave one full turn at the screw-lever at which he was stationed. We first made a few turns to the right until the main was raised sufficiently to permit of the removal of the temporary supports from under the pipe. We then reversed, and turned steadily and uniformly, till the main reached its final resting place in the bed of the river. Two hours and a half only were occupied in accomplishing the task, and our main now rests in its rocky trench at the bottom of the river, with the entire volume of the river quietly flowing over it, instead of, as a few hours before as quietly flowing under it. While the trench in the bottom of the river was in excellent shape, yet I left all the screws attached, and under partial tension, till the trench was partially refilled and the pipe firmly bedded, after which the screws and chains were removed, the refilling of the trench completed, and the false work taken out, and now nothing remained in sight to indicate the scene of our recent busy operations. The main was again tested after it was lowered to place, and found to have sustained no injury in the process of laying. The plan here outlined for crossing rivers with water-mains is superior to any with which I am familiar, and if properly executed will always ensure successful and satisfactory results."

NOTES.

M. CANOVETTI, an Italian engineer, has published a note on the sanitary work done and in progress for the city of Naples, of which the following is an abstract:

The old part of the city is greatly overcrowded by a poor population, and has a high mortality rate. The water-supply was very scanty, but is now abundant, being furnished from a mountain across the valley through an inverted syphon 20,000 metres in length, which now delivers 100,000 cubic metres per day, or about 200 litres for each person. The water is furnished by a private corporation, which charges 25 centimes per cubic metre to householders and furnishes 15,000 cubic metres per day free for municipal purposes. After this water-supply was introduced cholera ceased, although some cases occurred in the suburbs where this supply was not furnished.

A system of intercepting sewers has been decided on to deliver the sewage into the sea at a remote point, and a wide street is to be cut through the darkest and densest part of the city. If all the work which is mentioned by M. Canovetti as being in progress is properly carried out, it will make a great difference in the sanitary condition of the city.

In a paper on Dr. Koch's bacteriological water-test, recently published in the *Lancet*, Professor G. Bischof gives the following as his conclusions:

"(1) The total colonies found by culture in gelatine-peptone do not represent the total actually present in a sample of water, but an indefinite aliquot part thereof. (2) The number of total colonies found does not, within a very wide range, justify the rejection of a sample; no more can a sample be relied on as safe if very few colonies only be indicated. (3) The test, does not, as a rule, allow of distinction between pathogenic and harmless microphytes. (4) Pathogenic microphytes present in a sample of water are apt to escape detection by being crowded out by the organisms ordinarily occurring in water. (5) The relative biological purification indicated by the test in samples of water after filtration through sand is at variance with other well-known facts, and should be accepted with caution."

THE hydrant is the rival of the fire-engine, besides being its assistant. This was clearly recognized in days gone by, and gave rise to some curious scenes. Mr. Edwin Chadwick was informed that when hydrants were first put down at Liverpool, a fire was put out by the hose and jet alone when the appliance was first used; but when the men of the Brigade force arrived on the spot with their engine, they were so enraged with the man who had put out the fire that they attacked and beat him for interfering with what they conceived to be their privilege. Previous to 1862, in one of the sub-districts of London, an officer in charge got the idea that by the insertion of a hose into a plug, or attaching it to a stand-pipe, he could frequently extinguish a fire before the engines reached the spot. The man not only thought it out, but "he did it." Unhappily, in putting out the fire in this fashion, he also extinguished the rewards which the vestries were in the habit of giving to the men whose engine arrived first, second, or third at the scene of the fire. The emoluments for working the engines were also lost. So much obloquy was incurred in consequence, that this man in advance of the age had to abandon the project, both he and the men who acted with him being stigmatized as low fellows—"stand-pipe men."—*Engineering*.

AMONG the regulations recently issued by the Belgian Postal and Telegraphic Administration for the construction of electric-lighting circuits, it is strictly prohibited to make any connections with gas or water pipes. Wherever the lighting conductors cross telegraph or telephone wires, they shall pass underneath the latter at right angles, and at a minimum distance from them of two metres (6½ feet), and, moreover, shall be protected above by a strong wire to prevent contact in case of the breakage of the telephone wires. Electric-light conductors shall not run parallel with telephone or telegraph wires if it can be avoided, but, where necessary, the distance between them shall be at least 12 metres (39.3 feet). The installation must be tested regularly, at least once daily. The contractor shall assume the entire responsibility for all damage or accident arising from his electric-light installations.

THE inhabitants of the Bootle district in the suburbs of Liverpool have lately had an unpleasant, although fortunately harmless, experience in connection with their water-supply. The water, as delivered for several days in succession, was offensive both to sight and smell. It appears that a disused stone quarry in the neighborhood had been loaded up with a material known as "blue billy," which is rich in iron. The pumping-engine being under repair and stationary, the old quarry became flooded, and when started again the water had become impregnated with the material. The water on being analyzed was certified as being quite wholesome, although impure.

THE NAUTICAL ARENA, PARIS.

The following description of this aquatic circus is abstracted from the *Genie Civil and La Nature*:

This institution, inaugurated last year, is intended to furnish an amusement resort in the form of circus in winter and a swimming-bath in summer.

The main hall is a circular one, some 100 feet in diameter, lined with galleries and rows of boxes, elegantly decorated and draped.

In the centre of the hall is a concrete basin some 10 feet deep and 80 feet in diameter, lined with white marble. This basin is supplied with a constant flow of warm water. It has a circular overflow around the sides and also a syphon overflow with automatic air-valve which allows the surface to be kept constantly clear while the water is drawn off from the bottom of the tank. It has a capacity of 42,000 cubic feet and is filled from a well 270 feet deep, furnishing water at 12° Centigrade (54° Fahrenheit). This supply is heated to 23° Centigrade (73° Fahrenheit), by means of the condensed water of the engines in the building. This condensed water is passed through two preliminary tanks so as to draw it off and keep it clear of oil. This hot water flows at the rate of 1,750 cubic feet per hour.

In the middle of this concrete basin is a hydraulic piston supporting a platform 45 feet in diameter. This platform is an open-joint wooden floor, on 20 I-beams radiating from the piston-head and connected by concentric circular beams. On the circumference of the frame-work are guides which slide in grooves in 20 iron columns placed regularly all around the outside. There are also 5 columns around the piston 5 feet out from it, which are held to the frame by their heads and slide in cylinders sunk in the masonry foundation to the ram. When the ram is run out to its full height the whole platform is made to revolve by means of hand gears sufficiently to bring the guides out of the grooves of the columns and bring them over brackets on which they are lowered slightly and thus steady the whole system. By the same motion the five centre posts are drawn from their casings and brought to bear on foundation blocks. In this position the whole frame-work is perfectly steady and can stand the equestrian evolutions upon it without any appreciable vibration.

This whole movable frame-work weighs about 30 tons, and the raising is done by means of 4 pumps absorbing about 5 horse-power. Each operation of raising takes 80 gallons of water at from 25 to 35 atmospheres of pressure. It takes 5 to 6 minutes to raise it and from 1 to 2 to lower it.

In summer the platform is lowered to a depth of about 3½ feet and supported on brackets which revolve on the 20 columns. This forms a shallow bath for children and those who cannot swim. It is connected to the bank of basin by means of an iron bridge. The outer basin forms a swimming bath 19 feet wide all around the outside of the other and some 10 feet deep.

In winter this annular bath is covered by iron girders forming tiers of seats reaching up from the centre ring to the second floor which is arranged with boxes and a circular passage outside. The inner platform is covered with a mat of cocoa-fibre all in one piece, which weighs some 2 tons, on which the horses perform as on the ordinary tan, with the advantage that it gives no dust. When they get to the nautical performances the mat is rolled up and drawn off on special trucks, then the platform is gradually lowered into the water.

In summer the boxes on second floor are transformed, the sides being swung around to form dressing-rooms against the wall with a passage in front. Similar rooms are extemporized on first floor; there are 60 on each floor.

The question of heating the hall was quite important so as to prevent all condensation of moisture from this large body of water, on the walls, etc. The hall has a capacity of 530,000 cubic feet.

By means of a fan-blower seven feet in diameter, air is taken above the roof and carried through three hot-air furnaces before being delivered into the hall under the second floor seats at 104° Fahrenheit. The outlet is in a

cupola over the hall. The temperature of the hall is thus maintained at from 64° to 70°. In winter 1,412,000 cubic feet of air is blown in per hour; in summer 2,118,000. This increased amount was found necessary on account of the larger surface of water uncovered when the seats are removed.

Around the main hall are rooms for hydropathy, hot-air baths and vapor baths, besides small bathing-rooms for washing before going to the swimming-bath.

The ell of building contains stabling for 20 horses and paraphernalia, which is changed into a gymnasium in summer. On the upper floors are a gymnasium, fencing-room, smoking and reading rooms, and café.

The main entrance has a fine vestibule and elaborate stairway, built by Charles Garnier, architect of the Opera House; the building having previously been used for a panorama of the Battle of Reischhoffen.

The whole is lighted by electricity.

In the large hall, eight Soleil lamps with opal globes and a star formed with ten Jablochhoff horizontal candles; and a garland of 400 Edison lights in the front of balcony. There are 60 incandescent lights in the corridor.

At entrance four Street & Maquaire arc lights.

In café four Soleil lamps.

In all 1,200 incandescent lights of half ampere, placed on three circuits to prevent all danger of total darkness in case of accident. For instance, in the boxes there are 5 lights, 2 on 25 horse-power Edison dynamo, 1 on battery of 60 accumulators and the other 2 on 25 horse-power Edison dynamo. The accumulators are being charged during the day time.

The Jablochhoff lights are connected to two alternative Maquaire machines excited by two small dynamos.

The power is taken from two 60-horse-power engines on one fly-wheel and from one 30-horse-power engine, all of the Corliss type, built by Lecouteux & Garnier. The boilers of Collet type are arranged for fine fuel.

Architects Gridaine & Sauffroy; frescoes, by Delaunay; engineering, Jules Solignac; hydraulic work, Edoux.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

ELEVATOR-CAR INDICATOR.

The accompanying drawing illustrates a novel elevator-car indicator, recently patented by Q. N. Evans, of No. 12

Cortlandt Street, New York, and in use in the new Cotton Exchange Building and in the Astor Building in Wall Street, the object of which is to show the position or floor at which the car of an elevator may be to persons on any of the other floors of a building and indicate the direction of its movement.

The apparatus consists of a water-tank A, diving-bell B, flexible tube C, and permanent iron pipe C', the latter connecting with the indicators d d', shown in enlarged section at D.

The indicators consist of a glass tube (t) similar to a water-gauge glass, and a cup (c) or small reservoir of colored water.

The principle taken advantage of is the compression of air by the diving-bell as it is submerged in the water; the compressed air acting through the hose and tube C on the surface of the water in the little reservoirs c c forces it upward in the tubes t t, which latter are marked to correspond with the level of the floors.

It may appear to a close observer that the expansion of the air by heat or loss by leakage would disarrange the whole adjustment, but this is provided for by the diving-bell being just drawn out of the water every time the car reaches the top of the house, allowing the atmosphere to equalize itself each trip of the car. Motion is given to the diving-bell by the differential pulleys and belt, as shown, and here again self-adjustment comes into play each trip. Stop-balls on the balance-chain from the head of the diving-bell are made to strike stops as shown, so that should there be slip or lost motion, a ball will strike either on the up or down position, causing a slip of the chain over the pulley at the head of the diving-bell.

An overflow-pipe is provided to the tank A, and a slight drip of water from a small pipe continually falls into the tank to make up for loss by evaporation. The water in the glass tubes is colored red to contrast with the glass itself, that it may attract the attention of the unobservant.

METHOD OF CONNECTING FIXTURES TO HORIZONTAL BOILERS.

ASBURY PARK, N. J., May 31, 1887.

SIR: I was helping a plumber fit up a house at Lakewood, N. J., and they wished to get the boiler out of the way on account of small kitchen. It is a 40-gallon vertical boiler set up in a horizontal position. Will you kindly illustrate it in your next issue for comment, to see if I can obtain a better way for doing same? The boiler is always hot at the top as well as at bottom, and the pipes are so hot between water-back and boiler that you cannot put your hands on them. Hoping this will meet with your approval, I remain, yours respectfully, HELPER.

- A. Circulation.
- B. To boiler from water-back.
- C. To water-back from boiler.
- D. The sediment.
- E. Hot water to fixtures.
- F. Cold water to boiler.
- G. Check-valve.
- H. Vacuum-valve.
- I. Tube for cold water.
- J. Brackets that support boiler.

[We are always willing to give space to our young readers who want a criticism of their work when they make us a good sketch. We have no fault to find with the arrangement shown, as it will undoubtedly circulate well unless the pipes are obstructed. There are other ways of doing it, and as it may be only a difference of opinion as to whether they are better or not, we refrain from reproducing any of them, but if some more of the helpers will send us their method of doing it we will publish it.]

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

CONTRACTING ENGINEERING AND PLANT. KEYSTONE BRIDGE COMPANY, } PITTSBURG, June 11, 1887. }

SIR: I note in your issues of April 30 and May 7 in the discussion of our traveler on the elevated work for the Suburban Rapid Transit Co. that I have been accredited with designing same. If credit belongs to any one in this matter it is to our Superintendent of Erection, Mr. George Buchan, now in charge of the erection of the Missouri River Bridge at Kansas City. In discussing the erection of this work some time last fall I suggested the idea of the overhead traveler with long swinging arms, and he worked out the details. The idea even was not original with me, as I saw the same principle applied by Mr. Lassig, of Chicago, in St. Paul, early in the year 1884. Yours very respectfully,
A. F. BROWN, General Manager.

MACHINE FOR TESTING STRENGTH OF BUILDING MATERIALS.

OFFICE OF BOARD OF EDUCATION, }
MINNEAPOLIS, MINN., June 7, 1887. }

SIR: Mr. Gates A. Johnson, of St. Paul, Minn., can find a first-rate testing-machine for all kinds of building materials in the State College of Mechanic Arts in this city. Professor William A. Pike conducted a series of experiments for me while I had charge of the department of building inspection, which were satisfactory in every respect. The college is probably the best equipped of any in the State for this work, and Professor Pike has been willing to make tests of materials when the purpose was to benefit the public in general. Sincerely yours,

WALTER S. PARDEE,
Supervising Architect Board of Education.

HOW TO MAKE CELLARS DRY.

NEW YORK, June 10, 1887.

SIR: Will you kindly inform me through your paper what I must do to make my cellar dry.
The floor is concreted, and there are windows back and front, but it is damp, and everything gets moldy in it.
Yours,
"MORRISANIA."

[It is not generally understood that all mixtures of cement or lime with sand, etc.—in other words, all mortars—are more or less porous, and that they will all absorb moisture.

This being true, if a hole be made in the ground and walled up, and the bottom concreted ever so well, it is only necessary for water to stand against the exterior for some of it to be absorbed. In time the concrete and the stone or brick may become saturated, or nearly so, and evaporation will take place at the interior, tending to cause dampness.

For this reason it is always well, where practicable, to have tile drains around a house at a depth at least as low as the bottom of the foundation (of course with a suitable outfall) so as to promptly remove the soil-water. If this be done the walls and bottom will never become saturated with wet, and the cellar will be dry.

A second remedy is to coat the bottom and sides with a layer of damp-proof material. The rock asphalts are best. The natural bitumens and the coal-tars also serve a good purpose. This must be done by persons familiar with the work.

In building a new house a damp-proof course in the walls near the bottom and bitumen, etc., outside and in the bottom are used.]

ERRATA.

IN our reply to "Earlham," page 15, issue of June 4, the last line of the second column should begin to read "inlets to each room," etc., instead of "inlets to six rooms."

OUR attention has been called to the fact that the fulcrum of the automatic damper-regulator shown on page 689 of our issue of May 28, Vol. 15, is on the wrong side of the power or centre post of the bowl, when the apparatus is used to govern a draught-door.

Gas and Electricity.

Illuminating Power of Gas in New York City.

E. G. LOVE, Ph.D., *Gas Examiner.*

EXPERIMENTS have been successfully conducted for a week past on the lighting of the Hoosac Tunnel by the Westinghouse system of electric-lighting. The work is done by the Westinghouse Electric-Light Company of Pittsburg.

THE Boston Electric Club was partly organized on June 12. The following committee was appointed to consider and report a complete plan of organization at a meeting to be held on Tuesday, June 21, at the offices of *Modern Light and Heat*: Frank Ridlon, of the Brush-Swan Electric-Light Company; W. B. Hosmer, of the Thomson-Houston Electric Company; A. H. Chapman, of the New England Telephone Company; H. H. Eustis, of the Eastern Electric Cable Company; B. S. Flanders, of the city Fire Alarm Department; R. F. Ross, of *Modern Light and Heat*; W. I. Barker, of the *Electrical World*, and F. Gilley, of the *Electrical Review*.

BOSTON SOCIETY OF CIVIL ENGINEERS.

A REGULAR meeting of the Boston Society of Civil Engineers was held Wednesday, June 15, thirty-one members and three visitors present.

Messrs. Nelson Spofford and George N. Barrus were elected members and two names proposed for membership.

Announcement was made of the death of George A. Parker, an honorary member, and a committee appointed to prepare a memoir.

Mr. Edward S. Philbrick read a paper on "The Land Slide on the Boston and Maine Railroad, at Dover, N. H., May, 1884."

It was voted to omit the July and August meetings.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

A MEETING was held Wednesday evening, June 15, President W. E. Worthen in the chair, and John Bogart, Secretary.

The subject presented, "Construction of the Panama Canal," was given in a very entertaining manner by M. T. Bowlonge, a French engineer, who has been in charge of a portion of this work.

He stated that the profile prepared for the work indicated only the greatest depressions and elevations of the surface. Of the total estimated quantity, 140,000,000 cubic metres only 30,000,000 cubic metres has been removed, or one-fifth. There are areas of marshland on both eastern and western slopes that have never been surveyed; the construction of these areas to be done after the more elevated portions are completed, postponed on account of their fever-producing quality. These marshes are filled with timber, and covered to a depth of two feet with water during the dry season.

The large dredge in use there removes the material by scooping it out in front of the dredge. The highest elevation a lock can be built and obtain a necessary supply of water would be 11.8 metres above tide. He confirms the reported sliding of slopes on a portion of the line. Description of climate was severe for the Isthmus, as he stated it to be dry for three months and raining day and night for the remaining nine. It is extremely difficult to obtain laborers on account of the climate. Negroes from Africa cannot be obtained without force, and it required three months in one instance to obtain 171 negroes, but they proved to be strong.

The death-rate among the whites has been eighty per cent. Out of seventy-two foreigners holding positions as agents, clerks, and draughtsmen, only eleven are now on the work, 45 per cent. have died, and the remainder have returned home. The work can be continued only four months longer with the funds now on hand. At one point the surveyed lines do not connect, but lap each other, and it will require a new survey if work is continued to completion.

The committee having charge of the arrangements for the convention, Messrs. W. G. Hamilton, Stephenson Towle, and John Bogart, will visit Hotel Kaaterskill on Thursday, the 16th, to make final arrangements for the comfort of the members and guests.

PERSONAL.

MR. HENRY W. ROGERS, President of the New England Water-Works Association, has become General Superintendent of the works and undertakings of the Gardiner Water Company, of Maine.

BREVET MAJOR-GENERAL JOHN G. PARKE has been appointed Superintendent of the United States Military Academy at West Point, N. Y.

ARCHITECTURAL COMPETITIONS:

PLANS FOR STATUES.—The Trustees of the James Lick Trust, of San Francisco, Cal., invite designs on paper for the construction of the groups of historical statues to be erected in the space set apart in front of the City Hall of San Francisco, Cal., and in accordance with Thirteenth Trust in James Lick's Deed of Trust.

All the plans to be submitted shall be made on a scale of not less than three-fourths of an inch, and not more than one inch to a foot, and from the various designs which may be submitted, three will be selected by the trustees for consideration and further modification to be made, if found desirable. The artists submitting these three designs selected will be invited to submit models and full details for competition. The artist whose plans and models are finally selected from these three will be entitled to enter into a contract, containing proper covenants and agreements, for the construction of the work, with said trustees, and the remaining two, whose designs are not accepted, will receive five hundred dollars (\$500) each. Prominence to be given to bronze in composition of statues, as required by the terms of the Thirteenth Trust. Preference, so far as practicable, to be given to materials obtained in California. Sketches to be all submitted on or before the 15th day of September, 1887.

The expenses of advertising and other incidental expenses, and the sum of \$1,000 for the purpose above mentioned, will be reserved from the sum of \$100,000 for the statues.

The trustees reserve the right to reject any or all sketches and designs submitted.

For further information address H. E. Mathews, Secretary, San Francisco, Cal.

NEW YORK CITY.—The Grant Monument Association calls for designs for the Grant Memorial in Riverside Park. Designs should be sent to 146 Broadway before November.

TRADE CATALOGUES.

THE Holly Manufacturing Co., of Lockport, N. Y., have sent us their new 1887 catalogue describing the gas-kilns, hydrants, and valves manufactured by them.

THE Messrs. John Wiley & Sons, 15 Astor Place, New York, have sent us their new circular catalogue entitled "Practical Works and Text-Books on Civil, Mechanical, Mining, and Marine Engineering, etc., containing full titles, descriptions, and press notices, selected from the latest catalogue of our publications." Copies will be sent free on application.

PUBLICATIONS RECEIVED.

REPORTS FROM THE CONSULS OF THE UNITED STATES. No. 76, April, 1887. Washington: Government Printing Office. 1887. Also Reports from Consuls, Nos. 77 and 78. Washington: Government Printing Office. 1887.

ANNUAL REPORT of the Chief Engineer Board of Public Affairs, Cincinnati, O., for the year ending December 31, 1886. H. J. Stanley, Chief Engineer.

SIXTH ANNUAL REPORT of the Board of Water Commissioners of the city of Amsterdam, N. Y. A. H. De Graff, Superintendent.

ANNUAL REPORT of the Board of Public Works of the city of St. Paul, for the year 1886. L. W. Rundlett, City Engineer.

ANNUAL REPORT of the Board of Health of the city of Toledo, O., for the year 1886. C. L. Van Peet, M. D., Health Officer.

MISCELLANEOUS.

LITTLE ROCK, ARK.—The Little Rock Electric-Light Company will erect a new building for their plant.

DECATUR, ALA.—The Decatur Wire-Fence Machine Company, capital stock \$25,000, has been organized.

BESSEMER, ALA.—The Bessemer Brick Company has been incorporated, capital \$50,000, for the manufacture of brick, tile, etc.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 61-62-63-64.

WATER, SEWERAGE, ETC.

SYRACUSE, N. Y.—The surveys are nearly finished for the reservoir of the Syracuse Water Company at Osceola in Lewis County.

SALT LAKE CITY.—Note the movement now going on to raise funds for an extension of water-mains in this city.

NEW YORK CITY.—The Hydraulic Reclamation Company has been incorporated. Capital stock, \$100,000. John B. Bolles and others are incorporators.

MONTROSE, PA.—Address A. Lathrop, Chairman of the Building Committee, about water-works which it is proposed to establish here.

WATER COMPANIES.—The Council Grove Water Company, of New York City, has been incorporated; capital stock, \$100,000; George B. Inman, and others, incorporators. The Worcester Water Company, Worcester, N. Y., has been incorporated; capital stock, \$35,000; H. H. Smith, and others, incorporators.

ALBANY, N. Y.—The latest proposition about a water-supply comes from Andrews & Co., who offer to furnish 10,000,000 gallons daily from wells sunk in the Van Rensselaer Flats at \$237,500 per year. If this plan is accepted, the water will be first conveyed in a 42-inch iron main to the Blecker Reservoir. Further, dams will be built on Patroon Creek, above the contamination in "Sand Creek," and a reservoir, with a capacity of 15,000,000 gallons, will be built near the Tivoli Lake. A \$20,000 filter plant will also be constructed. The total cost is estimated at \$1,000,000.

PHILADELPHIA, PA.—To meet current demands for extension of the water-service, the Water Bureau needs much new iron pipe.

GLOVERSVILLE, N. Y.—\$20,000 will be expended in constructing sewers. The Village Trustees have the matter in charge.

WELLSVILLE, O.—This town will have sewerage as soon as possible.

MUSKEGON, MICH.—The citizens have started a movement for sewerage. Address the Mayor.

ANDOVER, MASS., has a bill in progress in the State Legislature giving the town authority to obtain a water-supply.

SACCARAPPA, ME.—The town meeting of June 8 indefinitely postponed action on the proposition of the Portland Water Company to furnish water at \$2,500 per annum.

TOLEDO, O.—Mr. S. P. Axtell appeared before the Water-Works Board recently and put in a proposition for a plant to furnish 5,000,000 gallons of pure water filtered by the Hyatt system every 24 hours for less than \$100,000.

NORWALK, CONN., will have a system of sewers. Work will be begun immediately.

CHATTANOOGA, TENN.—We stated in our issue of May 21 that a filtering plant was to be put in here. The contract for the plant has since been let to National Water-Purifying Company, 145 Broadway, New York.

CITY OF MEXICO.—We recently noted that the Bucyrus Construction Company, of Bucyrus, O., has been awarded the contract for draining the Valley of Mexico. The contract is for \$4,000,000, on the understanding that the work shall be successfully carried out. Daniel P. Ellis, W. H. Harris, and others of Cleveland, are the company.

BOSTON Board of Aldermen are considering the appropriation of \$30,000 for sewage-pumping engines at the Dorchester Bay tunnel.

ALBANY, GEO., will have water-works; also a street-railroad.

WARSAW, ILL.—The Business Men's Association should be addressed in regard to obtaining water from a well system.

BOWIE, TEX., is taking steps to secure an artesian well.

GREENVILLE, MICH., is taking steps to obtain a water-supply.

MILWAUKEE.—Bonds will be issued as follows: Intercepting-sewer bonds, \$60,000; water-works bonds, \$500,000.

PORTLAND, ME.—The City Council, June 6, accepted the new contract with the Portland Water Company, by which the company agrees to construct as soon as practicable a reservoir on Munjoy Hill, at the same elevation as that on Bramhall, with not less than 15,000,000 gallons capacity, to be completed on or by January 1, 1889.

ALLEGHENY, PA., has a committee of the City Council inquiring about a better water-supply. Address Councilman Seaman.

STEELTON, PA., will have water-works. President Wood is chairman of the committee of inquiry.

GERMANTOWN, PA., needs additional water-mains.

SALT LAKE CITY, UTAH, is discussing the obtaining of a better water-supply for drinking and household purposes.

NASHVILLE, TENN.—The enlarging of the water-works is going on under the direction of City Engineer Jewitt. There will be a filtering plant, pumping-engines capable of furnishing 4,000,000 gallons daily, and a reservoir. The contractor is Mr. Holmes.

GLOVERSVILLE, N. Y.—A special election will be held to vote on raising \$5,000 for sewers.

NEW BRUNSWICK, N. J.—A movement is well under way to convert Lyle's Brook into a covered sewer. Address Professor Austin Scott in regard to the matter.

ATHENS, FLA.—Steps are being taken to obtain water-works.

WATER-COMPANY.—Chartered is the Artesian Water-Company, of Memphis, Tenn.

WATER-METERS.—See our "Proposal" columns for proposals for water-meters needed by the Spring Valley Water Company, of San Francisco, Cal.

DENTON, TEX., will have two new artesian wells.

JOLIET, ILL.—The city is seeking to buy the works now controlled by New York parties.

PITTSFIELD, MASS.—A bill is before the State Legislature providing for better sewerage in this place.

GREAT BARRINGTON, MASS., Water Company will increase its stock by \$50,000.

SANTA FE, N. M., is projecting an important work in the way of water-supply. It is proposed to build storage-reservoirs in the foothills and bring the water by ditches to the city for irrigation and power.

BURLINGTON, VT.—The water-main will be extended 300 feet into the lake. A fire-proof fuel shed will also be built. For both \$9,000 has been appropriated.

WATER COMPANIES.—The Beaver Dam Water-Works Company, Beaver Dam, Wis., has been incorporated. E. G. Ferris, and others are incorporators.

The Panama Water-Supply and Improvement Company, New York, N. Y., has been incorporated. Conrad N. Jordan, and others are incorporators.

RALEIGH, N. C.—J. C. Brewster has the contract for building a system of sewerage in this city. He will want vitrified-pipe.

WALLA WALLA, WASH. T., needs an engineer to design a water-works. Address W. H. Reed.

KALKASKA, MICH., is agitating the obtaining of a water-supply.

MECHANICSVILLE, IOWA.—Address George W. Fall, or Dr. N. S. Hubbell, about obtaining a water-supply here from artesian wells. A report upon the subject will soon be made.

ATHENS, GEO.—The question of water-works is being considered.

GRIFFIN, GEO.—A proposition has been made to build water and gas works. For further information address the Mayor.

SANFORD, FLA.—The Sanford Water Company has awarded the contract for a reservoir to Louis McLain. They will erect a new pump.

ATHENS, GEO.—The question of a sewerage system is being agitated.

RIVERHEAD, L. I.—The subject of obtaining a water-supply is being agitated.

DENVER, COL.—The Cortez Water Company has been incorporated; Franklin M. Lawrence and Seth L. Larrabee, incorporators.

MONTCLAIR, N. J.—The Township Committee has closed a contract with Mr. E. B. Bartlett for a supply of water for ten years. The source will be wells sunk in the northern part of the township.

BOWIE, TEX.—The City Council will issue \$4,000 in bonds to drill an artesian well and build water-works.

WATER-WORKS.—Works are projected in the following towns: Bartlett, Iowa; Nickerson, Kan.; Sycamore, Ill.; Kinsley, Kan.; Columbus, Wis.; Manitou, Col.; Scotland, Dak.; Walnut, Iowa; Wakefield, Neb.; Halstead, Kan.

INCORPORATED is the Great Falls, Mont., Water-Power and Town Site Company; will build works. Louis G. Phelps, V. Wilson, and C. A. Broadwater are incorporators.

WALLA WALLA, WASH. T.—There is a project on foot to obtain water-supply by conducting the water from a creek about a mile above the village, carrying the iron pipes along the side of the cañon in which the creek flows, to a reservoir to be constructed on a hill top, then distribute the water through the village.

BURNET, TEX.—It is reported that A. R. Johnson contemplates building water-works.

MANCHESTER, TENN.—The question of water-works is being agitated.

MORGAN, TEX.—The Morgan Works and Ice Company has been organized, capital, \$5,000, to establish water-works and ice factory.

GAS, STEAM, BUILDINGS, ETC.

INCORPORATED in Ohio is the Winget Oil and Gas Company of Wapakonnet, capital \$5,000.

ROCKLAND AND NORTH ABINGTON, MASS., has appointed a joint committee to investigate systems of street-lighting. The committee recommends the Patton naphtha gas. The cost of introducing it will be about \$20,000, of which \$15,000 has already been raised.

ATHOL, MASS.—The House of Representatives has passed a bill allowing Athol to be lighted with water-gas.

COMPANIES.—The Electric Service Company of Buffalo filed a certificate of incorporation June 6. The capital stock is \$40,000.

The certificate of the increase of the Buffalo Gas-Light Company's capital stock from \$500,000 to \$1,000,000 was filed June 6. The number of shares now out is 20,000.

WESTFIELD, N. J., is investigating systems of electric street-lighting. Address Mayor Miller.

SCHENECTADY, N. Y.—The Edison Electric-Light Company will remove its works from Harrison, N. J., to this city, where works will be built.

NEW BRIGHTON, STATEN ISLAND.—The Electric-Light and Power Company is incorporated; capital, \$10,000. A. K. Gregory, Philip S. Swain, Robert Maitland, all of Brooklyn, are incorporators.

GREENVILLE, N. J.—The Taxpayers' Association will soon hold a meeting to provide means for obtaining gas, also for sewers.

CUMMINSVILLE, O.—The North Side Natural-Gas and Oil Company has sunk a gas-well here, and will lay mains.

CLEVELAND, O.—The Board of Industry is now developing plans for sinking gas-wells, improving the dockage, dredging the river, and building a belt line of railroad along the water front.

CAMDEN, N. J.—The Lighting Committee, of Camden City Council has awarded contracts to the Camden Gas-Light Company and the Wheeler Reflecting Light Company (Limited), of Philadelphia. The former bid was \$25 per annum per lamp, and the latter kerosene oil at \$20. The Camden Electric-Light Company bid \$146 per lamp per annum. Contracts for lamp-posts were awarded to Morris, Tasker & Co. (Limited), for \$7.25 per post, and for street lanterns, to J. Hall Rohman at \$2.70 each.

STILLWATER, MINN.—Bids for lighting the streets were lately received as follows: The local gas company, 200 lamps of 16 candle-power, \$3,200; the Incandescent Company, 200 lamps of 25 candle-power each, per year, \$5,000, and the Stillwater Arc-Light Company, 40 lights of 2,000 each, equaling 80,000 candle-power, \$125 a lamp per year.

BIRMINGHAM, ALA.—The Walker County Coal-Oil Company has been organized; capital stock \$50,000.

GAS CONSOLIDATION.—The Bay State Gas Company, a New York corporation, is trying to arrange a consolidation of all the Boston gas companies under its control. The company will build a plant, acting through the Beacon Construction Company. Elisha S. Converse, Asa P. Potter, and Henry D. Hyde are the advisory committee.

SOUTHBRIDGE, MASS., Electric-Light Company is incorporated, with H. C. Wells, C. A. Dresser, A. Hall, and others, directors.

ALBANY, N. Y., Common Council has voted franchises to the Edison Electric-Light Company and the Municipal Gas Company permitting them to furnish electric-lights for streets. The company are required to furnish 16-power incandescent lamps.

INDIANAPOLIS, IND.—Several propositions are before the city, looking to the erection of a natural-gas plant, and furnishing of the gas for fuel. One of them is presented by the Standard Oil Company.

DENVER, COL., is taking steps to secure natural-gas. An experimental well has been sunk with success; \$25,000 will be raised for the work. Address J. Bristin Walker, of the Chamber of Commerce.

NEW YORK CITY.—The Citizens' Freeman Electric-Light Company has applied to the Board of Aldermen for permission to erect poles and string wires throughout the city, and offers to furnish to the city as compensation for the franchise, all the 2,000 candle-power street-lights it wants at 20 cents a night of ten and a half hours, one free light for every fifty lights furnished to private consumers, and to pay one cent per linear foot of streets occupied.

STILLWATER, MINN.—The Stillwater Electric-Light Company was organized June 10; President, R. F. Hersey; Secretary, R. H. Bronson.

AUSTIN, TEX.—The following charters have been granted: the Edison Light and Power Company, of Fort Worth; capital, \$50,000; incorporators, Sam Hunter, J. W. Schuber, J. G. Watkins, T. T. Cornise, and Max Elser. The Denison Natural-Gas, Coal and Mining Company; capital, \$60,000; incorporators, J. E. Streeper, T. B. Hanna, W. A. Tibbs, A. R. Collins, J. R. Carr, E. T. Hathaway, and George Brown.

PARKERSBURG, W. Va.—The city has granted exclusive privilege to the Natural-Gas Company to use the streets for gas-mains for ten years, natural-gas to be furnished for heating purposes only. The company is composed of Senator Camden, George W. Thompson, C. H. Sattuck, Henry C. Jackson, J. N. Camden, Jr., and others.

BOSTON.—The American Conduit Company will lay electric conduits here.

WARSAW, ILL.—The Warsaw Electric Light Company will light the streets. It is expected the work will be finished by July 1.

NEW YORK CITY.—Franchises for the supplying of electric lights for lighting have been given to the American, the Waterhouse, the Bell, the North New York, the Harlem, the Mount Morris, and the Mutual Union Electric Light Companies.

MOBILE, ALA.—The Progress Electric Light Company has signed the contract for lighting the streets.

GAS COMPANIES.—Incorporated are the Jerseyville, Ill., Electric Light and Power Company; capital stock \$29,000; incorporators: John G. Schwarz, Wallace Leigh, Walter E. Carlin. Also the Stillwater Natural Gas and Coal Company, of Dayton, O.; stock \$5,000.

RAILROADS, BRIDGES, CANALS.

KNOXVILLE, TENN.—A charter was filed June 9 incorporating the Atlanta, Knoxville and North-western Railroad Company. The charter members are Alexander A. Arthur, M. L. Ross, and W. R. Tuttle, of Knoxville; George B. Eager and R. M. Pulsifer, of Boston, and James V. Jackson, of Augusta, Geo. They will build a road from Atlanta to Knoxville, and from Knoxville to a point at or near Cumberland Gap, where a connection will be made with the extension of the Louisville and Nashville and Norfolk and Western Railroads. Grading will be begun within a few weeks.

DEADWOOD, DAK.—The town is taking steps to have the Elkhorn Valley Railroad extended to Deadwood. Address D. A. McPherson.

SIoux CITY, IOWA.—The Sioux City Bridge Company will begin work on the railroad bridge here at once. Marvin Hughitt, of the Chicago and Northwestern Railroad, is president.

BROOKLYN.—Commissioner Conner has determined to spend \$215,000 in paving some of the streets of the Twenty-sixth Ward.

COSHOCOTON, O.—The Coshocton and Southern Railroad proposes to build a road, and is now making surveys. J. C. Pomerene, of Coshocton, is a director.

NEW YORK CITY.—The Dock Department will widen West Street to 250 feet, rebuild Piers 35 and 36 and the line of bulkhead.

RAPID CITY, DAK.—The narrow-gauge railroad will be built by E. B. Chapman, of Omaha. It will be about thirty miles long. Murray Bros., who have the contract to grade thirty miles of the Fremont, Elkhorn and Missouri Valley roadbed west of here, have arrived from Oakdale, Neb., and will begin work at once.

SANDY HILL, N. J.—The Board of Trustees advertise for granite blocks and crushed stone for street work.

CHILLICOTHE, MO.—Bridge Commissioner J. G. Powell has reported to the County Court recommending the construction of his iron bridge, one over Grand River and one over Shoal Creek, at a total net cost of \$9,015.

DUBUQUE, IOWA.—President Touzalin, of the C. B. & N. R. R., will let a contract in a few days for a railroad bridge over the Mississippi.

RAILROAD.—Incorporated is the Minnesota and South-western Railroad Company to construct a line from Northern Pacific Junction south-east to the boundary of Minnesota and Wisconsin. James M. Paine, Edgar M. Wilson, Horace P. Breed, Frank W. Booth, and others, are directors.

LITTLE ROCK, ARK.—Articles of association have been filed with the Secretary of State by the Hope and Shreveport (La.) Railway Company. The capital stock is \$500,000. The directors are J. T. West, W. Y. Foster, S. W. Bundrige, C. T. Short, Patrick Donnelly, R. M. Thompson, and Edward Alexander. The road will pass through the Counties of Hempstead and Lafayette, a distance of fifty miles. The principal offices will be located in Hope.

MILWAUKEE.—The Milwaukee City Railway Company will extend its tracks into Bay View (17th Ward), as follows: On Reed Street, Maple, Clinton, Becher, Robinson Avenue, Lincoln Avenue, Howell Avenue, Potter Avenue, Clement Avenue, Superior and Estes Streets.

ELIZABETH, N. J.—Henry H. Isham, of New York, and Adjustment Commissioner Frederick L. Heidritter, of Elizabeth, will build a street railroad.

LITTLE ROCK.—R. F. Wilson, Street Contractor, has closed a contract with Weigel & O'Keefe to furnish Fourche Mountain granite for street paving.

RAILROAD.—The Stateville and Western Railroad of Texas is extending to Taylorsville, Tex.

RAILROAD.—The Winnipeg and Hudson Bay Railroad asks the Provincial Legislature for authority to raise \$10,000,000, for extending the railroad.

RAILROAD.—The Columbus, Lima, and Western Railroad is being extended in the city limits.

STRATFORD, CONN.—The N. Y., N. H. & H. R. R. is surveying the depot grounds, with a view to improvements.

SPRINGFIELD.—Surveys are in progress for the Springfield, Shellyville, and Mount Carmel railroad.

KNOXVILLE, TENN.—The Marietta and North Georgia Railroad Company will build an iron bridge to cost about \$100,000.

CLEBURNE, TEX.—The contract to extend the Gulf, Colorado, and Santa Fe Railroad has been awarded to Ricker, Las and Company, of Galveston.

CORSICANA, TEX.—Messrs. Roche and Tierney have been awarded the contract to extend the St. Louis, Arkansas and Texas Railroad, from Corsicana to Hillsboro.

DALLAS, TEX.—The Missouri Valley Iron Bridge Company have been awarded the contract to build an iron bridge across Trinity River.

CHAUTAUQUA LAKE, N. Y.—Mr. Elnathan Sweet, State Engineer, is considering the dredging of the outlet of this lake. A bill is before Governor Hill appropriating \$30,000 to the work.

NEW YORK CITY.—The Board of Health will cause the Mott Haven Canal to be dredged out.

BIDS OPENED.

KEARNEY, N. J.—The contracts for constructing the new Soldiers' Home buildings in Kearney have been awarded to E. B. Vliet and Dey & Goble. E. B. Vliet will do the carpenter-work for \$71,000. Dey & Goble will do the mason-work. The contracts have been accepted and the necessary bonds have been given. Work will be commenced at once, and will have to be completed in six months.

MONTREAL, CAN.—Bids for supplying chainstone crossings, flaggings, etc., and also for sewer construction have been received by the Road Committee, as below. The contracts were awarded as follows: A. Desmerault, straight stone curbing, 53c. per foot; curved stone curbing, 60c. per foot D. Lawrence, sidewalk flags, 4x2 feet, at \$2.20; 6x3 feet, \$2.85; crossing flags, 20 inch wide, 50c.; 24 inch wide, 55c. The contract for hauling and laying the various kinds of stone was awarded to Mr. John Parker, at prices ranging from 13c. to 55c. per lineal foot.

LEAVENWORTH, KAN.—The following bids for building hospital for Western Branch, N. H. D. V. S., were received by Colonel E. F. Brown, Inspector General: Holtzclaw Bros., Washington, D. C., for building complete, including heating and plumbing, \$98,500; T. H. O'Neil, Wichita, Kan., for building complete, including heating and plumbing \$95,300; James H. McGonigle, Leavenworth, for building complete, including heating and plumbing, \$92,789. The contract was closed with McGonigle.

BOSTON, June 11.—The Water Board opened proposals for furnishing cast-iron pipe and special castings required for Beacon Street, caused by a relocation and change of grade of said street, and also for the Cochituate service in East Boston. R. D. Wood & Co., of Philadelphia, bid \$35 per ton for 1,100 tons of 24-inch pipe, \$34.50 for 170 tons of 30-inch, \$34 for 450 tons of 48-inch, and \$74 per ton for 80 tons of special castings; the aggregate amount of his bid was \$65,585. A. H. McNeal Pipe Company, of Burlington, N. J., bid \$35.50 for 1,100 tons of 24-inch pipe, \$35 for 170 tons of 30-inch, \$35 for 450 tons of 48-inch, and \$70 to \$100.80 for special castings; the total amount of the bid of Mr. McNeal was \$66,812. The contract was awarded to R. D. Wood & Co.

MILWAUKEE.—The Board of Public Works let contracts June 8, as follows: John O'Neil, constructing 616 feet of brick sewer in Tenth Street, \$1,618.

Charles Røediger, laying 3,076 feet of sewer in Twelfth, Thirteenth, and Fourteenth Avenues, \$4,738.90.

Jacob Warner, laying 1,156 feet of pipe sewer in Eighth Street, \$1,473.90.

J. C. F. Brand, laying 1,177 feet of pipe sewer in Fowler, Eighteenth, and Nineteenth Streets, \$1,380.95.

J. C. F. Brand, laying 857 feet of pipe sewer in Summit Place, Cramer Street, and Bellevue Place, \$1,209.40.

John O'Neil, laying 753 feet of brick sewer in Farwell Avenue, \$2,658.09.

James Reynolds, laying 990 feet of brick sewer in North Water Street, \$1,831.94.

ALBANY, N. Y.—The contract for dredging 20,000 cubic yards of material from the river at Mull's, North Coeymans, has been awarded P. W. Myers, of Albany, at 16 3/4 cents per cubic yard, by the Superintendent of Public Works.

TOPEKA, KAN.—The State House Commission has awarded the contract for building the State Capitol to George H. Evans & Co., at \$422,000.

BOSTON, MASS.—Bids, in accordance with the advertisement of the Board of Directors for Public Institutions, for a supply of dimension stone at Deer Island, have been opened as follows: E. S. Chapen, Boston, edgestones 30 cents per foot, catch-basins \$6.08, \$6.70, \$7.75; Pigeon Hill Granite Company, Rockport, edgestones 37 cents per lineal foot, catch-basins \$5.90, \$6, \$5.90; Lanesville Granite Company, Lanesville, edgestones, 40 cents per lineal foot, catch-basins \$10.50, \$20, \$14.50; J. J. Horgan, Cambridgeport, edgestones 30 cents, catch-basins \$6, \$8, \$6; Rockport Granite Company, Rockport, edgestones 37 1/2 cents per foot, catch-basins \$5.75, \$6, \$6.

In accordance with the notice of the Superintendent of Streets, proposals were opened June 11 for furnishing and delivering 4,000 cubic yards, more or less, of crushed stone, on Washington Street, West Roxbury District, between Forest Hill Station and Ashland Street. Owen Nawn was the only bidder at \$2.20 per cubic yard, and the contract was awarded to him.

NEW YORK CITY.—Bids were opened at the Department of Charities and Correction on Tuesday, June 14, for alterations and additions to the Retreat at Blackwell's Island and for the construction of a pavilion to relieve the almshouse. For the Retreat, bidders, Joseph Spears, \$39,090; John H. Deeves & Bros., \$40,900.

Pavilion, bidders, John H. Deeves & Son, \$20,750; Thomas Ovington, \$22,823; James H. Brady, \$39,462.

Also for repairs to steamer "Minnahamock" as follows: C. & R. Poillon, \$1,771.40; M. Theriault, \$1,175; John F. Walsh, Jr., \$1,194; N. F. Palmer, Jr., & Co., \$1,952; Jenkins & Tregarten, \$1,325. No awards have as yet been made.

NEW YORK CITY.—Bids were opened at the Department of Docks, on Thursday, June 16, for preparing and building a new wooden pier at the foot of West One Hundred and Thirty-second Street, North River; for preparing and building a new crib bulkhead at and south-westerly of West One Hundred and Thirty-second Street, North River, and for repairing the crib bulkhead northerly of the crib pier at the foot of One Hundred and Thirty-second Street, North River. The following were the bidders:

John M. Monks, New York, dredging, per cubic yard, 25c.; new crib bulkhead complete, \$11,094; repairs to existing crib bulkhead, \$2,196; new wooden pier complete, \$17,452; total, \$33,367.

John W. Flaherty, New York, 28c.; \$11,875; \$2,800; \$19,775; \$37,300, respectively.

O'Connell & Coffey, Brooklyn, 28c.; \$10,875; \$2,175; \$15,583; \$31,573, respectively.

Joseph Walsh, New York, 28c.; \$11,500; \$2,718; \$18,700; \$35,858, respectively.

John Gillis, Brooklyn, 20c.; \$11,469; \$1,841; \$17,918; \$33,328, respectively.

Award not yet made.

The following bids were also opened—for preparing and building a crib-work bulkhead at the foot of East Seventy-sixth Street, East River:

John W. Flaherty, New York, total, \$5,300; O'Connell & Coffey, Brooklyn, total, \$4,945; Joseph Walsh, New York, total, \$6,000.

LEAVENWORTH, KAN.—The following bids for two iron

Board of County Commissioners, June 5: Kansas City Bridge and Iron Company, Kansas City, Mo., Walnut Creek, \$4,399; Kansas City Bridge and Iron Company, Kansas City, Mo., De Soto Road, \$4,274; Wrought Iron Bridge Company, Canton, Ohio, Walnut Creek, \$6,800; Missouri Valley Bridge and Iron Company, Leavenworth, Ohio, Walnut Creek, \$4,300; Missouri Valley Bridge and Iron Company, Leavenworth Kan., Five-Mile Creek, \$2,200. Bids rejected as being above estimate.

BROOKLYN.—Bids for building twenty-seven buildings at the County Farm at Saint Johnland were opened by the County Commissioners, June 16, as below: P. J. Carlin, \$890,000; James Birkett, \$934,530; Edward Freely, \$906,000; James & Taylor, for erecting three buildings, \$88,350. All bids were referred to the Committee on Contracts.

Bids for lighting the County Farm by electricity were received from Williams & Potter, who agreed to supply everything in connection therewith for \$38,300, and the Edison Manufacturing Company agreed to do the same for \$37,000.

SAN DIEGO, CAL.—Contracts for pipe, cement, etc., were awarded to the following bidders: Ditching 20,000 feet to J. John drew for \$10,000. Pipe—San Francisco Sewer-Pipe Association, from 21 cents to \$8 per lineal foot, according to size and quantity. Cement—W. W. Stewart, at the following prices: Portland and K. B. \$3.90, Gillenham \$3.80, and Eagle \$3.75 per barrel.

CAMDEN, N. J.—The following bids have been received for the 10,000,000-gallon pump for the Camden Water-Works: George F. Blake Mfg. Co., New York, \$32,400, \$35,500, and \$45,000; Dixon Manufacturing Company, Scranton, \$67,500; H. R. Worthington, New York, \$30,750, and \$19,275; Davidson Steam-Pump Company, New York, \$34,800 and \$28,000, and Holly Manufacturing Company, Lockport, \$39,500 and \$29,500. The bid of the George F. Blake Co. for \$35,500 has been accepted.

GOVERNMENT WORK.

ABSTRACT of bids for timber, iron, and stone, at the harbors of Buffalo, Dunkirk, Oak Orchard, Olcott, and Wilson, N. Y., and Erie, Pa., opened May 16, by Captain F. A. Mahan, U. S. Engineers, at Buffalo:

Buffalo Harbor.—Laycock Lumber Co., Buffalo, 1,272 lineal feet of piles, 25 cents per foot; 5,728 feet, B. M., \$26 per M.; 119,728 feet, B. M., of white pine, \$25 per M.

G. Elias & Bro., Buffalo, 25 cents, \$24, \$21, respectively; contract awarded.

Beals & Brown, Buffalo, 3,466 pounds of drift-bolts, 3.1 cents per pound; 450 screw-bolts, 50 cents each; 8 kegs of spikes, \$4.87 per keg.

Daniel McNaughton, Buffalo, N. Y., 2.2 cents, 55 cents, \$4.60; contract awarded.

Dunkirk Harbor.—Beals & Brown, 24,286 pounds of drift-bolts, 3.1 cents per pound; 180 screw-bolts, 40 cents each; 29 kegs spikes, \$4.87 per keg.

Daniel McNaughton, 2.7 cents, 48 cents, \$4.55; contract awarded.

Laycock Lumber Co., 254,280 feet, B. M., of hemlock, \$10 per M.

G. Elias & Bro., \$10.50; contract awarded.

Oak Orchard.—Laycock Lumber Company, 274,560 feet, B. M., of white pine, \$25 per M.

G. Elias & Bro., \$25 per M.

Miles S. Vosburgh, Wilson, N. Y., \$24.90 (contract).

Beals S. Brown, 17,000 pounds drift-bolts, 3.4 cents per pound; 17 kegs spikes, \$5.25 per keg.

Daniel McNaughton, 2.9 cents, \$4.80 (contract).

George M. Waterman, Albion, N. Y., 3 cents, \$5.50.

Miles S. Vosburgh, 1,043 cubic yards of stone, \$1.25 per cubic yard.

Owen & Calvert, Youngstown, N. Y., \$1.80.

Hannibal S. Sethermer, Carlton, N. Y., \$1.15 (contract).

Olcott.—Laycock Lumber Company, 131,768 feet, B. M., of white pine, \$25 per M.

G. Elias & Bro., \$25 (contract).

Miles S. Vosburgh, \$24.90 (contract).

Beals & Brown, 9,700 pounds drift-bolts, 3.4 cents; 10 kegs spikes, \$5.25.

Daniel McNaughton, 2.9 cents (contract), \$4.80 (contract).

Miles S. Vosburgh, 474 cubic yards of stone, \$1.22 per cubic yard (contract).

Owen & Calvert, \$1.55.

Wilson Harbor, N. Y.—Laycock Lumber Co., 22,488 feet, B. M., of white pine, \$25 per M.

a., propose to put in a \$125,000 blast furnace here. The citizens' meeting has urged the City Council to furnish bonus.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 4. } PUBLISHED EVERY SATURDAY.

NEW YORK, JUNE 25, 1887.

LONDON, JULY 9, 1887.

SINGLE COPIES, TEN CENTS. } IN AMERICA
Subscription, \$4.00 per year in advance, post paid. }
SINGLE COPIES, SIXPENCE. } IN GREAT
Subscription, 20s. per annum in advance, post paid. } BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 20, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

SOCIETY PUBLICATIONS.

THE Royal Institute of British Architects has a very admirable regulation to the effect that it will not publish matter in its "Transactions" which has previously appeared in print. The consequence is that the "Transactions" are sought for, and nearly always have some good original matter interesting to the architect. The third volume, recently received by us, is no exception to the rule. In reading it one is struck with the variety of topics which can profitably employ an architect, and with the number of good themes which can be found in the most unpromising fields. Thus, a paper by William Simpson on "Mud Architecture" develops a quantity of interesting facts collected during a trip through Persia and other countries. His paper is quite as interesting as a record of travel as it is in the light of an architectural document, and he supplements it with a number of notes on Mud Architecture as practiced in other countries besides Persia. He claims to have established the fact that the Great Wall of China was in part, at least, built of mud, or sun-dried clay cemented with mud, which amounts to the same thing, and he traces the use of mud as a building material through Greece, Egypt, nearly all the countries of Europe, England, America, and clear to San Francisco. It will cause many readers considerable surprise to find the extent to which mud is still used. In the south of France *pisé* construction is generally adopted for ordinary dwellings, and in England what is known as cob-walls are used all through Devonshire. In our own country we know that adobe is in quite common use in the West; indeed, the oldest building erected by Europeans in America is the church at Santa Fé, built entirely of mud, which celebrated its three hundredth anniversary some five years ago.

Another interesting paper records the notes of a tour in Greece, by Professor Lewis—interesting at least to those who are at all familiar with the country, though it goes into details to a degree that renders it rather fatiguing to the ordinary reader.

But the paper which to our mind seems of the greatest value is one by Professor Kerr on the "Architect's Functions in Relation to Building Contracts." It is a very clear-headed view of a difficult problem—one that is very seldom treated at all in theory, and is exceedingly difficult to elucidate in professional practice. We cannot do better than to quote his words directly, especially as his remarks apply with almost equal force to engineers and to architects:

"The proprietor or employer desires and expects two things: first, to get his work done with all proper economy; secondly, to know beforehand what money he must provide. Both these expectations are quite reasonable, for the architect and the quantity surveyor are paid expressly to realize them. But at the same time we all know that in both cases the principle is liable to abuse.

"When the proprietor is allowed to overstrain economy he overstrains the contract, and anything that is overstrained, no matter what it is, must sooner or later snap. When he goes even further than this, and hopes to secure a contractor who has made an unwary reckoning, and means to hold him to the grindstone of a losing bargain, he is (in my humble judgment)—let commercial law say what it may—contemplating something like a fraud; and in such a case, not only ought the sanction of the architect to be refused on the ground of honor, but both architect and client will do well to remember that there exist in-

flexible natural laws by whose silent operation the offender is not unlikely to find that grindstones grind both ways.

"You all know how often extras spring up like weeds in the field, in spite of precautions, so that the only way to avoid them hopefully is to recognize them fairly and make allowance for them—not scientifically, of course, but by some rule of thumb, which will answer quite as well; acknowledging in this way the principle that, so far as prudent and experienced advice and warning can accomplish the object, the client is really entitled to feel that the contract which he is advised to sign will cover the actual expense of his project."

That is surely to the point, and here is another good statement:

"In connection with such a complex case as that of a building contract the bargain in which one party has the advantage of the other, whether by design or by accident, is very likely to turn out a bad bargain for both alike. Speculative conditions, therefore, whose object is to impose upon the contractor unknown risks for which it would be idle to suppose that he has provided an adequate allowance, are essentially unsafe conditions."

How many of our architects would take such a view of the case if compelled to arbitrate between a gouty owner and a quarrelsome contractor? Professor Kerr's general view of the subject is, of course, taken from the architect's standpoint, but it is so fair-minded and free from prejudice, we can only regret that it is not more universally received and more fully lived up to by the profession on this side of the water. The principles he enunciates are worthy of remembrance by every architect who is called upon to settle disputes about a building.

"I am proud to be able to stand up in this assembly and repeat my proposition that the confidence with which building contractors are obliged to leave their fortunes to the good faith of the architectural professions is seldom abused; exceptions at any rate prove the rule."

"I come now to the end of my argument, and having regard to all the various incidental circumstances in which I have represented the architect as having to deal with building contracts, I have to submit that what I call liberality, loyal justice to all concerned, impartiality that is warm and sympathetic as distinguished from impartiality that is frigid and dead, is the best, strongest, and safest policy for him to pursue; avoiding harshness of every kind, and especially punitive harshness, as the province of the lawyer alone; and impressing upon his every word and act the mark of that generous fair-dealing (as distinguishable again from ungenerous fair-dealing) which underlies not only the traditional dignity of his vocation, but the personal position of almost unparalleled confidence which he is accustomed to occupy by general consent."

MILWAUKEE GARBAGE.

JUDGING from recent articles in the Milwaukee daily press, that city is rather behind the times in the matter of disposal of its garbage. It seems that this refuse matter has heretofore been disposed of by burial in the outskirts of the city, but that the local health authorities of the neighboring towns have declared this to be a nuisance and have forbidden its continuance, which under the State laws they have a right to do.

The city authorities have resorted to the plan of dumping the garbage into the lake and are thus running the risk of contaminating the water-supply as well as creating a small local nuisance, since the dumping-scow is only to be towed out every other day. The proper method of dispos-

ing of this refuse—namely, by burning it in a properly arranged furnace—does not seem to have received any consideration.

OUR BRITISH CORRESPONDENCE.

Water-Works for a District of Liverpool—Stagings at the Northern Railway Terminus—Sugar Saturated with Sewage—Healthfulness of New Blaydon, Northumberland—Basic Slag as a Manure—Pneumatic Tubes in Newspaper Offices.

LONDON, June 8, 1887.

NEW water-works have been inaugurated in the Wirral district of Liverpool, which has hitherto been dependent on a hand supply. A tower, 58 feet high, with wrought-iron tanks 30 feet in diameter by 35 feet, capacity of 100,000 gallons, has been erected on Heswall Hill. The water is pumped to this water-tower, a distance of four miles, and is supplied thence to the town through a 6-inch main.

one of the sewers. A portion of the cargo was saturated with the water and sewage contained therein, notwithstanding which the Medical Officer of the district permitted it to be put on the market. If the statement is incorrect, it is well that Dr. Davies should have the opportunity of contradicting it, but the information is given to me from a reliable source.

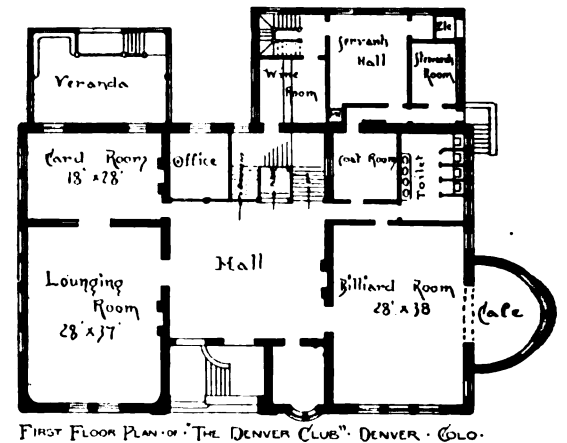

According to the *Sanitary Record*, the Medical Officer of Health of New Blaydon, Northumberland district, has a complaint against the people under his charge of being so distressingly healthy. At a meeting of the Local Board, he stated that he had nothing whatever to report of local interest, the state of health being fully maintained and altogether remarkable. He stated he might fairly claim to join in the doleful and too general cry of, "Yes, indeed; trade is very slack." This gentleman is to be congratulated.

The paper on Basic Slag as a Manure, read by Mr. Gilchrist before the Iron and Steel Institute, has aroused considerable attention amongst iron and steel masters.

OUR SPECIAL ILLUSTRATION.

DENVER CLUB HOUSE.—VARIAN & STERNER, ARCHITECTS.

THE subject of our special illustration this week, is the new club-house of the Denver Club, at Denver, Colorado.

FIRST FLOOR PLAN OF "THE DENVER CLUB," DENVER, COLO.

RESIDENCE OF FREDERICK SCHENCK, LAWRENCE, L. I.—LAMB & RICH, ARCHITECTS.

In connection with the reconstruction of the roof of the station at the Great Northern Railway Terminus, King's Cross, the method of staging adopted by Messrs. Andrew Handyside & Co., of Derby and London, commends itself both on the grounds of economy and simplicity. The entire existing roof had to be taken down and replaced with another of lighter construction. The work was done in sections. On the main platform on either side two heavily-built railway trucks, to run on continuous rails, supported a perpendicular staging, which was connected horizontally immediately under the roof. There are some six lines of metals abreast, together with platforms, in the station. When one section of the roof had been attended to a further section of rail was laid in front of the truck, the staging moved forward *en bloc*, and the next section taken in hand. The work has thus proceeded without the slightest interruption to the regular traffic.

The problem presents itself as to whether sugar saturated with sewage is a wholesome commodity to put upon the market. I hear that a vessel with a cargo of sugar sunk in the river at Bristol, immediately outside the outlet of

Insistence is placed on the point of fineness of the powder necessary before use. It is stated that an artificial manure company has undertaken to purchase any quantity of the artificial preparation which can be supplied by an iron company in the North, laying itself out for the manufacture, by whom the powder is rendered so fine that it passes through a mesh 10,000 to the square inch.

The Manchester telegraph office, and the *Sunday and Sporting Chronicle* office have lately been connected by pneumatic tubes with a view to more rapid receipt of press news. The distance is 420 yards, and the tube is lead-lined iron pipe, 1½-inch bore. Vacuum, 15 to 20 inches, is created in a steel chamber in the newspaper office by a set of 8-inch air-pumps. When a message is received at the telegraph office it is enclosed in a felt "carrier" and inserted in the tube; the newspaper office is signalled by electric bell and the suction is turned on. Time of transmission is stated at 10 seconds.

TV-VALVE.

It is built of gray and brown sandstone, with tile roof. Interior in hard woods, walls in leather, and "combed work." The architects were Varian & Sterner, of Denver.

OUR VIGNETTE ILLUSTRATION.

A HOUSE AT LAWRENCE, L. I.

THE subject of our vignette illustration is the residence of Mr. Frederick Schenck, at Lawrence, L. I. The house is frame, shingled. Inside finish old colonial, painted in light colors. Parlor white and gold. The architects were Lamb & Rich, of New York.

OUR DETAIL SHEET.

OUR detail sheet, the twelfth in the series, shows a store front at 1022 Walnut Street, Philadelphia. Wilson Eyre, Jr., architect.

A BILL has just been signed by Governor Hill which allows the gas companies to charge \$1.60 per 1,000 cubic feet for gas in the annexed district of New York City.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD ILLUSTRATED SERIES.

THE DENVER CLUB, DENVER, COL.

VARIAN & STERNER, ARCHITECTS.

WATER-WORKS OF THE EAST ORANGE AND BLOOMFIELD WATER COMPANY, NEW JERSEY.

THESE works are situated on Grove Street, about one and one-half miles northerly from the Grove Street Station on the Delaware, Lackawanna and Western Railroad. In connection with the subject of obtaining a water-supply from wells, these works possess especial interest from the fact that the water does not come through the soil, but from the rock below, and evidently has its source at some distance. The State Geologist, Professor G. H. Cook, thinks the source is the Orange Mountain, about three and one-half miles distant to the west. The elevation of surface at the site of the wells, according to the topographical maps of New Jersey, is about 100 feet above tide, while the elevation of the mountain is about 650 feet.

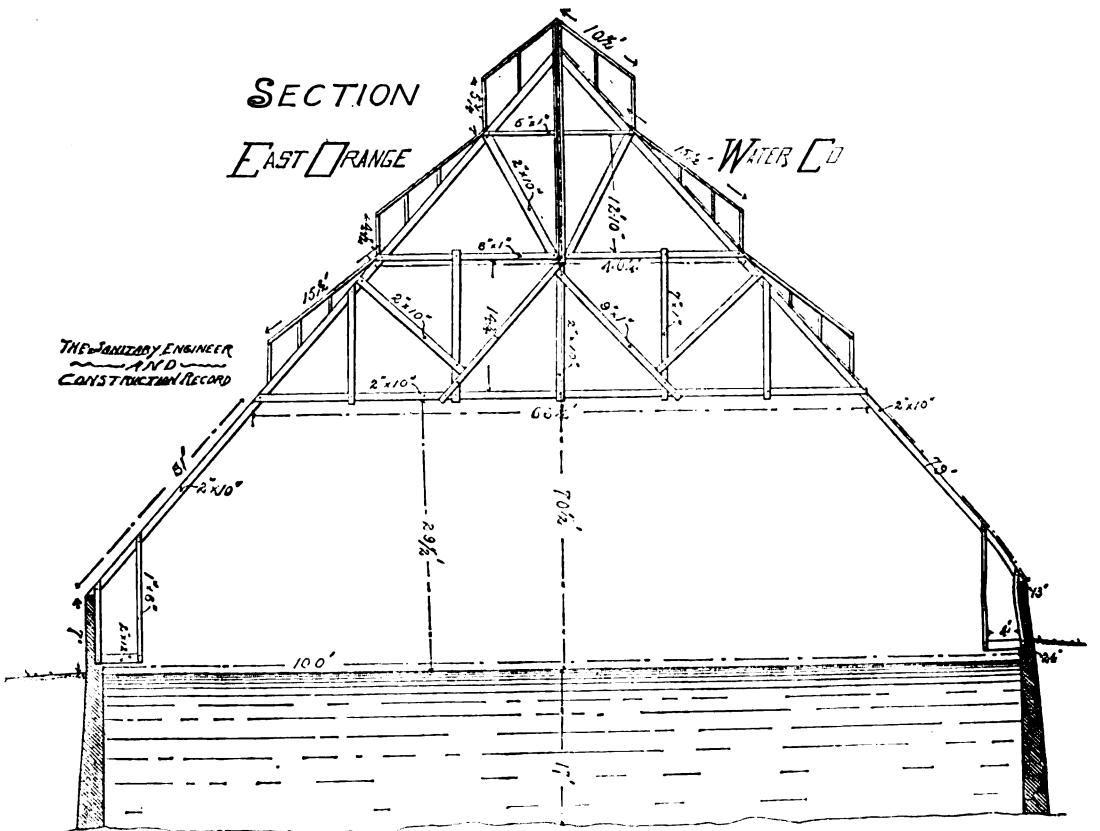

The pumping-station is situated in the valley, which is some fifteen feet lower than the road and 200 feet distant.

The pumping-engines are a Gaskill compound duplex condensing engine, with 10-inch and 20-inch steam and 12-inch water-cylinders, with 18-inch stroke, with an estimated capacity of $1\frac{1}{2}$ million gallons per day. Also, a Worthington duplex compound, with 12-inch and 18-inch steam and 14-inch water-cylinders, with 10-inch stroke, and a capacity of $1\frac{1}{4}$ million gallons. Either set is capable of supplying more than double the present requirements of the service, which are from 360,000 to 500,000 gallons. The supply is by direct pumping through two independent lines of 8-inch mains. The pressure for domestic service is 70 to 75 pounds and for fire service 125 pounds.

The grounds in which the wells are located was originally swampy, with a sluggish stream running across it. Mr. J. M. Randall, the Vice-President of the company and the designer of the works, began examining the site for water in 1883, by putting down a 6-inch tube-well to a depth of 95 feet. The water rose in this to within 5 feet of the ground surface. This well is inside of the pump-house. A second well of same size was next put down to same depth at 200 feet north of the first, followed by a third one at about the same distance south. These when connected up furnished a supply of 350,000 gallons a day. The third pipe-well was put down to 110 feet depth, and the water was found to be harder than was desirable, this hardness seeming to increase with the depth.

Ten acres more of property were then bought, and a well 25 feet in diameter was sunk a short distance east of No. 1 to a depth of 20 feet; this being about 10 feet into the bed-rock below. It was connected with the pumps by a 12-inch suction and yielded on a test about half a million gallons per day. The curb was a 20-inch cemented stone wall, tightly joined to the rock below, surmounted by a 12-inch cemented wall above, so as to shut out the surface and the ground water.

In 1884, No. 5 well, fifty-two feet in diameter and twenty feet deep, was sunk at about 600 feet from No. 1. This went eleven feet into the rock and will yield 1,000,000 gallons in twenty-four hours. It has been drawn upon continuously for six months at the rate of 500,000 to 600,000 gallons. The large well, No. 6, was put down in 1886, and is located about 700 feet from the pumping-station. It is 100 feet inside diameter and twenty-three feet deep, being sunk about twelve feet into the rock. The stone wall up to about the ground surface is thirty inches thick, and the brick wall above the eaves above is eight feet high and twelve inches thick. The building is a polygon with sixteen sides, each of twenty feet four inches external measurement, with a projecting entrance at one side. The height of the building over the well to the peak is about sixty feet, and the roof is in four slopes, with louvres covered by netting on the vertical faces between for ventilation. The roof-timbering is exceedingly light, but, being braced and tied in every direction, seems to stand well. It springs from wall plates 4x8 inches, the 2x12-inch rafters springing from the wall-plates at the angles and running continuously to the peak. The alternate rafters have light 4x2-inch diagonal braces in pairs at intervals all the way to the peak. The purlines are 10x2 inches, placed, with one exception, the

broad way at right angles to the rafters and at spaces of about three feet. At the top of the third slope of the roof each of the sixteen angles is tied by horizontal wooden ties, intersecting and joined at the centre. At the top of the second slope the alternate angles are tied by similar single and double ties. Braces are also run from the centre of these to the top of the lower slope of the roof. Vertical struts are also inserted as shown in the annexed section of the building, to make this bracing effective, and wherever a brace is lacking in lateral stiffness, cross-bracing and tying are resorted to, the result being, as stated, an exceedingly light roof.

The thrust at the angles of the wall-plates is taken up by wrought-iron straps $3\frac{1}{2} \times \frac{3}{4}$ -inch and 4 feet 6 inches long, bent to the angle and bolted to the exterior faces of adjacent sticks by $\frac{3}{4}$ -inch bolts, three in each end of each stick. A gallery, four feet wide, runs entirely around the inside of the building, and is hung up to the purlines by three $2 \times \frac{3}{2}$ -inch sticks opposite each face of the polygon. The purlines to which they are attached are doubled in thickness and placed vertical to be in position to sustain the load. The building is certainly very unique in appearance and seems well fitted for its purpose.

The water stands in the well at about eighteen feet depth, and is remarkably constant no matter what the weather may be, and when not pumped from heavily the water in all three open wells rises about three feet above the ground surface. The well No. 6 is connected with No. 4 by an 8-inch syphon pipe (since the ground descends between the two), and it therefore serves as a reservoir to be drawn

upon when No. 4 is reduced enough to cause a flow between them. Its storage capacity is nearly 1,500,000 gallons.

As a proof that the water does not come from the surface soil, the following statement is made. When No. 6 was being built the supply was drawn from No. 5 for five months constantly. For fourteen weeks of this time, while excavation was progressing, the pumps at No. 6 were kept running night and day to keep the water down so that the men could work, as it would submerge the work if pumping ceased but a few minutes. During the whole of this time the water stood in No. 4 at the full height, and without perceptible fluctuation.

The water seems to come in everywhere over the surface of the rock from seams and fissures in the red sandstone foundation. The rock is of a shaly character, brownish red in color, some layers being hard and resisting the weather, and others crumbling to pieces.

The capacity of No. 6 is estimated at $1\frac{1}{4}$ millions per day.

The fact that the water grows harder at a greater depth was determined also by the borings at the Licorice Works on Bloomfield Avenue, in Newark, about three-fourths of a mile away to the east of No. 6 well. A 6-inch pipe was sunk 25 feet at a time to a depth of 100 feet, and the water tested at different depths, with the result that the best water was found at 25 feet from the surface. There are 75,000 gallons pumped per day from the well.

As to the quality of the water furnished by the East Orange Company, its temperature is 50° Fah. in summer

and 47° in winter. An analysis by Prof. Cook showed absolute freedom from organic matter, a hardness equivalent to calcium carbonate 5.091. Total solids in grains

THE COLLAPSE OF THE DERRICK AT THE BROOKLYN NAVY YARD.

A 75-TON derrick collapsed while being tested at the

per gallon of 9.838, of which $2\frac{1}{4}$ grains were volatile (carbonic acid). The remainder were as follows:

	Grains.
Chlorine as chlorides.....	0.857
Sulphuric acid	0.379
Silica	1.230
Iron and alumina	0.046
Lime	2.209
Magnesia.....	0.712
Soda	1.936
Potash.....	0.227
Total	7.596

A CREMATORY COMPETITION.

THE Society of Architecture of Lyons has selected as the subject of its annual prize competition a crematory in the form of an appropriate monument to be erected in a cemetery. The structure with its surroundings and annexes must not occupy more than 2,000 square metres. It is to contain an anteroom and chapel, and beneath these a crypt into which the bier is to descend after the last funeral services. In this crypt space is to be provided for the cremating furnace, the chimney of which should be the chief motive of the building.

Besides the opening for the descent of the bier, two doors are to be provided to the crypt, one for the entrance of the relatives of the deceased, the other, which should be inconspicuous, for the employees of the establishment. Competitors need not pay attention to the particular form of furnace to be used; they have only to provide sufficient space for it in the central part of the crypt. Around the crypt provision is to be made by galleries and niches for about 5,000 urns, each occupying 0.120 of a cubic metre. There are required plans of each floor on a scale of 1 to 100, a general elevation, an elevation of the principal front, and a section of this front on a scale of 2 to 100. Competing plans must be sent to the "Secrétaire de la Société d'Architecture, au Palais des Beaux-Arts, Lyons, France," before November 31, 1887. The decision will be made by a committee of seven members of the society chosen by ballot. The prizes consist of a gold medal and a silver medal. They will be awarded in February, 1888.

CLEVELAND, O., ENGINEERS' CLUB.

At the meeting, June 14, Professor Stockwell read a paper on the "Use of the horizontal telescope for determining differences of latitude and longitude." Mr. William H. Searles presented the report of the committee on revision of the constitution. The matter will be considered further. It was decided to obtain and frame photographs of the President and ex-President, which will be hung in the club room.

THE graduation exercises of the Rensselaer Polytechnic Institute, at Troy, were held June 15. The class graduated forty civil engineers and two bachelors of science.

Brooklyn Navy Yard on June 15. The full particulars of the accident could not be obtained, nor was there much to be seen, as the pontoon on which the derrick stood was sunk. In general, the following may be said: The derrick was made from designs furnished by the Bureau of Steam Engineering, and built by The Pusey & Jones Company, of Wilmington, Del. It had been previously tested under certain conditions, and had lain at the Brooklyn Navy Yard for some months, when a board of officers was appointed by the Secretary of the Navy, with directions to test, first, what the derrick would lift up to the limit called for in the specifications—viz., a load of 75 tons lifted with the traveler at a distance of 33 feet from the end of the pontoon on which the derrick stood; second, to test also what the derrick would safely swing.

The derrick was of steel throughout, and of T-form, made up of a high, pyramidal, open-work standard of steel I-beams and ties and a king-post boom pivoted at the centre on the top of the standard. In plan the boom was a lozenge-shaped truss, with peripheral tension member, the longer diagonal being made up of two box-beams carrying a traveler between them. The box-beams were not continuous, but notched at the centre into a ring encircling the king-post pivot; two short struts butting also against the ring formed the co-ordinate diagonal of the lozenge.

The derrick was mounted on a pontoon secured by guy-ropes to the dock wall; the arm of the derrick, to which the weight was to be attached, was 61 feet from pivot to end, and projected over the dock wall about 40 feet, the counter-arm being secured by guys to the pontoon. At the end of the pontoon, away from the wall, were three ballast tanks into which water could be pumped as a counterpoise for the load lifted. The pontoon was also heavily ballasted with kentledge, laid in cement, on its bottom.

Before the accident took place, graded weights were lifted by the steam-hoist operating the derrick, and the effects on the stability of the pontoon were noted and its equilibrium preserved by pumping water into the ballast tanks. At the time the accident occurred the weight had been increased to 72 tons with the traveler 51 feet from the axis of the derrick and 33 feet from the front of the pontoon. The load had not quite cleared the ground when the pontoon dipped forward and listed to one side, throwing the derrick considerably out of the vertical, and, at the same time, it is believed the horizontal, peripheral tie of the boom-truss parted on one side, and the box-beams swung around to the side toward which the pontoon listed and dropped into the water with the rest of the boom and tackle. The pontoon, relieved of the weight at the dock end, plunged under water at the stern and finally sank, but without being overturned.

Efforts are being made to raise the wreck, when the cause of the accident will probably be definitely determined.

THE REPAIR AND MAINTENANCE OF ROADS.

BY W. H. WHEELER, M. INST. C. E.

FROM the *L. A. W. Bulletin* we abstract from an article, especially written for the National Cyclists' Union, some very pertinent remarks on the subject of road repairing and maintenance. The roads in many parts of our country are a disgrace to civilization, and it is undoubtedly true that an immense saving in money would result if their management would be left to the intelligent direction of educated engineers, instead of the ignorant roadmasters who consider a road made when it is heaped up in the middle:

"Although railways may have altered the character of the traffic on the common roads, the actual number of vehicles and amount of produce conveyed over them is no doubt greater than it ever was. The railways, by facilitating traffic, have greatly increased the resources of the country, but every ton of goods conveyed by railway must first pass over the roads leading to or from the place of production.

For economical and convenient traction, roads should be maintained in thoroughly good order. This, however, is too seldom the case, and many roads are kept in such a condition as to be a disgrace to the country.

This is the more inexcusable as it is a fact well known to all who have had experience in the matter, that roads well maintained and kept in good order cost less than bad roads. It is plain that if by keeping roads in good order, four horses are enabled to do the work of five, or three of four (by no means an unreasonable supposition), the economy of horse labor and wear and tear of vehicles and harness must be considerable, but economy in the actual cost of maintenance generally follows as well. Experience proves that a road with sufficient strength, good surface, and thorough drainage can be kept in first-rate order with a much smaller quantity of materials than an inferior, ill-kept road requires, and, though a greater amount of manual labor may be necessary, a good road on the whole is generally more cheaply maintained than a bad one, especially when there is any considerable amount of traffic. The indirect saving in the cost of traction and wear and tear of vehicles and horses, which would result from better roads, would probably far exceed any direct saving in expenditure on the roads."

It is estimated that the saving in England by improving the roads (and they are now greatly better than in this country) would be \$100,000,000 per year. This is on the supposition that three horses would be able to do the work of four. It is no exaggeration to say that on many of the roads in this country one horse would do the work of two were the roads put in good condition. The author, referring to English experience, quotes a case where the tolls on a turnpike were insufficient to pay expenses, but by a reorganization of the labor system and the selection of good materials, not only was the roadbed so much improved that the loads hauled were doubled, but the income paid off the debt.

To accomplish this, however, requires the supervision of a skilled engineer, and this is the rock on which authorities here are sure to come to grief, since every roadmaster is his own engineer.

There is no point upon which a more decided coincidence of opinion exists among all those who profess what may now be called the science of roadmaking, than that the first effectual step toward general improvement must be the employment of persons of superior ability and experience as superintending surveyors. The duties of surveyor demand suitable education and talents, and some skill in the science of an engineer should also be regarded as a valuable qualification, and these qualifications must be fairly remunerated.

In the case of roads in town and suburban districts, these are generally under the control of a board having efficient officers, and if the roads are not properly kept it cannot be from want of proper machinery to effect this object. In many of these cases, however, the fact does not seem to be fully realized that efficiency in management means economy in cost, and that efficiency and cost are invariably in inverse ratio.

The growing practice of using narrow wheels for vehicles carrying heavy loads is very destructive to the roads, the width of surface covered by the narrow wheel not being sufficient to bear the heavy weight imposed on it. It has been proved by repeated and careful experiments that wheels with two-and-a-half-inch tires cause double the wear on a road than those do which have four-and-a-half-inch tires. On good roads there is no great advantage in a greater width than four and a half inches. Telford's rule was one inch of tire for every 500 weight on the wheel. By this a cart weighing with its load two tons would require four-inch tires. The following proportions have been advised by competent authority:

	WIDTH OF TIRE.	
	Without springs. Inches.	With springs. Inches.
$\frac{1}{2}$ to $\frac{3}{4}$ ton on each wheel.....	3	4
$\frac{3}{4}$ to 1 ton on each wheel.....	4	5
1 to $1\frac{1}{2}$ tons on each wheel.....	5	6

It has even been recommended by some that all carts weighing over 600 pounds should be restricted to wheels of not less width than four inches, and the vehicles drawn by more than three horses should have wheels of not less than six inches.

Wheels of a large diameter also do less harm to a road than small ones. Stones will be pushed and moved out of their places by the small fore wheels of a wagon, whereas the larger hind wheels will pass over without displacing them. Large and broad wheels not only do less harm to the roads, but cause less draught for the horses.

A perfectly good road should have a firm and unyielding foundation, good drainage, a hard and compact surface free from all ruts, hollows, or depressions. The surface neither too flat to allow water to stand, nor too convex to be inconvenient to the traffic; free from loose stones, the fresh material being put on whenever practicable in winter in such a manner as to inconvenience the traffic as little as possible; all mud scraped off the surface as soon as it arises and not left in heaps on the road, the longitudinal inclination not to be greater than such that a horse may trot down hill with a vehicle behind it without danger.

With the exception of the first and last, all these conditions may be obtained in our existing highways. The great bulk of the roads have been made without any sufficient foundation, and the coating of surface material is so thin that unless constant and vigilant attention is given, the wheels rapidly cut through the crust in wet or frosty weather. The rain thus gains a way into the under foundation, and large quantities of new material are required to be put on before the road can be restored. It is impossible now to provide these roads with good foundations, but it is practicable, notwithstanding, to convert them by proper management into very good roads.

In hilly districts it is not possible to reduce the inclination to such a gradient that a horse can safely trot down, but there exist numerous cases where, at a comparatively small expenditure, by taking off the crest of a hill and filling the hollow, dangerous portions of roads might be improved and convenience of the traffic greatly increased. A gradient having a rise of one foot in every 40 may be considered perfectly safe for a horse to trot down with a light vehicle. An inclination of one in 20 is too steep for convenient traction, and should, if possible, never be exceeded. The latter gradient is too steep, and is the cause of great inconvenience, especially in level districts, it being frequently impossible for a horse to take the load that he can well draw along the level road up such an inclination.

The power required to move vehicles along a road varies with its conditions. The harder and more level the surface the less tractive power is required. On a good paved road a force of 33 pounds is required to move a ton; on a well-constructed road maintained in good order, a force equal to 46 pounds, and on an ordinary country road, fairly well kept, 65 pounds is required; whereas, on a badly kept road, with loose surface, the force mounts up to double and even treble the last figure.

The result of experiments made on a macadam road by the author with a dynamometer attached to a wagon having 3-inch wheels, the total load being two tons, showed that on a road repaired with hard gravel picked off the land and broken by hand, a tractive force varying from 224 pounds up to 280 pounds was required to move the wagon. The same road, repaired with granite broken into cubes to pass through a two and a half inch ring, and on which more labor and attention had been bestowed, required exactly half the force, or 112 pounds.

Although it is seldom that new roads forming main lines of communication have now to be made, yet it is desirable briefly to state the method of construction adopted by the best roadmakers.

The plan adopted by Telford, the greatest road engineer probably since the time of the Romans, was first to level and drain the site of the proposed road, then to lay upon it a solid pavement of large stones, and on this a layer of stones carefully broken so as to pass through a two and a half inch gauge, and no stone weighing more than six ounces, and over all gravel or other fine material in sufficient quantity to hide the stones. Great attention was paid to the surface until it became thoroughly solidified, and then it would stand for several years with a very little repair, one of the roads constructed in this way requiring nothing to be done, beyond cleaning the dirt off, for six years after its construction.

Macadam, who earned his reputation more as a converter of bad roads into good ones than as a constructor of new roads, differed from Telford in his system. Instead of the first coat of rough pitching, he substituted a layer of hard stones broken into angular fragments. This was watched, and as ruts or inequalities formed they were raked and leveled and fresh material added until a hard and level surface was obtained. The material used for coating was the hardest he could obtain, preference being given to granite, greenstone, or basalt.

The great art in roadmaking is so to construct the surface that no wet can penetrate from the top, and so that the dirt cannot work up from the bottom. The foundation must be of such materials as to form a uniform and unyielding body.

Burnt clay is dry and porous, and, if well burnt and thickly covered, makes a good material, but unless these conditions are complied with, it is liable to rapid deterioration.

With the exception of some of the principal thoroughfares, few roads in this country have been formed with a proper foundation. Generally a quantity of such material as could most easily be procured in the neighborhood has been shot down, leveled, and then left to become consoli-

dated by the traffic. This has gradually been worn away by the action of the weather and the wear and tear of the traffic, till only a very slight coating of hard material remains. In wet and frosty weather the wheels rapidly cut through this thin skin, and allowing the water to get below the surface level and the mud to work up from below.

A visible track once made in a road, all the vehicles will follow in the same course, each cutting into the road and forming two deep ruts. The hardest-paved road will wear away if the traffic be all kept in one track. If drivers would only vary their track a few inches, one set of wheels would counteract the effect of the others, and the road remain uninjured. The advantage of this is proved by the fact that wherever there is a turn in the road, however deep the ruts may be on the straight part, they disappear at the turn, because at the turning the horses coming from different directions naturally vary their course round the corners, and one wheel obliterates the track of the other. The experience of all roadmen can testify to the fact that at these points less material and labor is required than at any other part of the road.

One material point in the maintenance of roads is the transverse form. Roads that are too flat hold the water and keep the surface wet. A road that is too round is not only inconvenient for the traffic, but wears badly. On a road that is too round there is a necessity for the traffic all to follow in the same track along the centre of the road, that being the only part where a vehicle can run upright. The continual tread of the horses' feet in one track in the centre soon forms a depression which holds the water, so that such a road is not so dry, and wears more unevenly than one of a flatter section in which the traffic is more evenly distributed over the whole width. If the surface be allowed to wear into tracks and ruts, the roundness will not clear it of water. The best form for the transverse section of a road is that of an ellipse, the surface having a very small inclination in the middle and a steeper fall at the sides toward the gutter.

In dealing with the ordinary repair of roads they must be divided into two classes, the first being those which have to endure the constant and heavy traffic of towns and their immediate neighborhood, and the second, those subject only to provincial and agricultural traffic.

The attrition caused by the wheels of the thousands of vehicles which pass over town roads, many of them carrying weights of several tons, produces an immense amount of wear and tear and necessitates frequent and expensive repairs. The great advantage and economy of paved surfaces in towns need not be dealt with here. Where there is much traffic it is impossible to prevent macadamized roads from wearing into dust in summer and mud in winter. The thickness of the material, thus converted from the hardest known rocks into mud and dust, has been proved to amount to as much in one season as four inches over the part of the surface exposed to the most wear and two inches over the whole surface. The difficulty of replacing this material and combining effectiveness of repair, with consideration for the users of the road, has been a matter of much discussion. The practice of laying a thick coating of stone over the road and leaving the traffic to grind it down to a level surface is barbarous to the horses, destructive to all light vehicles, and wasteful of the stone. To enable broken stone to bond together and form an even surface, some substance must be used that will allow each stone to keep undisturbed with its neighbor. Unless some filling-in material is supplied, from one-third to one-fifth of the whole mass must be ground down to fill up the interstices before the stone can be bedded. In the process the angles are rubbed off the stones until their surface becomes rounded, rendering them liable to be constantly loosened. On the other hand, all fine material added, especially if it be not of good character, is liable to work into dust in summer and mud in winter. If the filling material be of an adhesive character in certain states of the weather it clogs the wheels and tends to the destruction of the road. After a sharp frost, when the thaw begins, the effect may frequently be seen of the material of which the surface is composed combining with the moisture and horse-dung to work into a sticky paste, which adheres to the wheels of vehicles and draws out the stones from the roads. Some road surveyors have adopted the plan of mixing the filling-in material with tar before it is placed on the coating of stone. A road treated in this way if well rolled before being used has a surface almost impervious to wet, and, owing to its elasticity, of a very enduring character. Granite chips or the screenings of the broken slag are an excellent material for mixing with tar. The heap of material after mixing should be allowed to remain for several days before use, otherwise it will be too sticky.

Constant watering in dry weather and cleansing of the surface is absolutely necessary to maintain the surface of a macadam road in good condition. The method of repair observed by the best road surveyors is to have the roads repaired in winter. The material used is the hardest and toughest to be procured, broken to an even and regular size, the fragments not larger than will pass through a two and a half inch ring. The surface is covered with sharp material of the same character as the stone ground in a stone-breaker to a size known as chips. After the stone and filling in has been evenly spread, the surface is well watered and rolled with a steam roller weighing not more than ten tons. A greater weight than this is apt to damage the gas and water pipes. After continual rolling the surface becomes thoroughly consolidated and even and fit for the traffic.

(TO BE CONTINUED.)

MICRO-ORGANISMS IN THE ATMOSPHERE.

DR. PERCY F. FRANKLAND recently read before the Society of Arts a paper on "Some of the Conditions Affecting the Distribution of Micro-organisms in the Atmosphere," which is a very excellent statement of the present state of knowledge on this interesting subject. After a brief historical sketch in which the various methods of collecting and counting these micro-organisms are described and criticised, the author expresses his preference for a method by which a definite volume of air is drawn, by means of an air-pump, through a short piece of glass tubing containing two small porous plugs placed one in front of the other. Of these two plugs, the first is constructed of glass wool only, whilst the second is formed of glass wool and glass or sugar powder. The object of this arrangement is that the second plug, through which the aspirated air has to pass, shall offer more resistance than the first, and, consequently, in the second plug is found to be free from microbes, it may safely be assumed that the first plug has been sufficiently obstructive to the micro-organisms in the air passing through, and that they have all been retained by it. Each plug is then transferred, with special precautions, to a small flask containing a small quantity of sterile melted nutrient gelatine; with the latter the plug is now agitated so as to cause its rapid disintegration, and the liquid gelatine is then evenly spread over the interior of the flask and congealed by rotating it in a stream of cold water. The flask is then maintained at a suitable temperature, and in due time the colonies, each resulting from one of the micro-organisms deposited on the plug, make their appearance and can be counted or examined.

He prefers this method to the use of Hesse's, chiefly on the ground that it is more independent of the action of wind or aerial currents. Indoors, and in an undisturbed atmosphere, the results of this apparatus are practically the same as those obtained by Hesse's method; but in the wind, especially when the direction is variable, the results of Hesse's method are considerably the highest.

The average number of micro-organisms found in 10 litres of air varied, according to months, from 4 in January to 105 in August.

In comparing the relative abundance of micro-organisms in different localities, the number of organisms found in 10 litres of air was as follows:

Top of Primrose Hill, 9; bottom of Primrose Hill, 24; top of Norwich Cathedral spire (300 feet), 7; at the bottom, 18; Golden Gallery of St. Paul's Cathedral, 11; in the churchyard beneath, 70; in Kensington Gardens, 13; Hyde Park, 43; Exhibition Road, 554; in the Chemical Laboratory of Science Institution, 32; in the room of meeting of the Royal Society near the close of the session, 432.

In a third-class railway-carriage containing four persons, soon after starting, the number of organisms that were falling on one square foot per minute was 395. Soon after this the carriage was filled, containing 10 persons, after which it was found that the number falling per square foot per minute was 3,120.

Reference is made to the experiments of Dr. Fischer, a surgeon in the German navy, on the number of micro-organisms contained in air at sea. At a distance from land of 90 sea miles the average of the experiments gave one organism in 26 litres; when the distance from land was 120 miles, it was one in 93 litres. Out of 12 experiments made at a minimum distance of 120 sea miles, in eleven the air was absolutely germ-free, so that it would appear that the maximum distance to which, under ordinary circumstances, micro-organisms can be transported across the sea is about 120 sea miles.

In those places where fewest organisms are found—that is, at high altitudes and in the open country—the relative proportion of moulds to the bacteria is much higher than it is in the air of towns and enclosed spaces. It appears probable that the spores of moulds are more buoyant than bacteria and are therefore floated further and higher by air-currents.

COUNCIL OF CIVIL ENGINEERS.

THE Council of Engineering Societies on National Public Works had a meeting in Cleveland, June 20. There were present: E. L. Corthell, of Philadelphia; L. E. Cooley, of Chicago; Augustus Kurth, of New York, and John E. Eisenmann, of Cleveland. The meeting was called to receive the reports of sub-committees appointed at the annual meeting to compile information in regard to the organization and conduct of public works of various countries.

NEW ENGLAND WATER-WORKS ASSOCIATION.

THE sixth annual convention of this body was held at Manchester, N. H., on June 15, 16, and 17. On the first day a business meeting of the Executive Committee was held at the Hotel Windsor at 1:30 P. M., and the convention was called to order for the opening session at the Court-House at 3 o'clock. Vice-President Kent, of Woonsocket, in the chair. A letter from President Rogers was read explaining that his absence was caused by pressing business engagements which could not be put aside. The presiding officer then introduced Hon. John Hosley, Mayor of Manchester, who cordially welcomed the association to the city, and Mr. Kent responded in fitting terms.

The reading of the minutes was dispensed with, and the brief and business-like reports of the secretary and the treasurer were read, accepted, and ordered placed on file. The treasurer's report showed a cash balance of over \$500, with all bills paid.

On motion of Mr. Hall, of Quincy, a committee to nominate officers for the ensuing year was appointed by the chair, and consisted of Messrs. Hall, of Quincy; Noyes, of Newton, and Sherman, of Providence.

The Executive Committee presented the following list of applicants for membership, with the recommendation that the list be admitted. The convention adopted the suggestion of the committee with no dissenting voice.

FOR ACTIVE MEMBERS.

Rudolph Hering, Chicago; Frederick P. Stearns, Boston; William E. McClintock, Chelsea; George F. Swain, Boston; George A. Kimball, Boston; J. J. R. Croes, New York; Louis H. Knapp, Buffalo, N. Y.; Arthur W. F. Brown, Fitchburg, Mass.; R. A. Jones, Spokane Falls, Wash. T.; Wilson Henderson, Peterborough, Canada; William Molis, Muscatine, Iowa; E. A. W. Hammatt, Boston; R. S. Hicks, Stafford Springs, Conn.; Weaver Osborne, Fall River; Charles H. Baldwin, Boston; Charles E. Chandler, Norwich, Conn.; C. C. Hitchcock, Ware, Mass.; W. W. Robertson, Fall River; S. J. Winslow, Pittsfield, N. H.; Cyrus B. Martin, Norwich, N. Y.; C. H. Truesdell, Central Falls, Conn.; W. C. Boyce, Worcester; Melvin C. French, Kingston, Mass.; D. N. Tower, Cohasset, Mass.; Everett Burns, Westerly, R. I.; F. A. W. Davis, Indianapolis, Ind.; John C. Whitney, Newton; John L. Harrington, Cambridge; William Schwenk, Mount Carmel, Pa.; Solon F. Smith, Grafton, Mass.

FOR ASSOCIATE MEMBERS.

R. A. Robertson, Jr., agent of the Builders' Iron Foundry, Providence, R. I.; Pancoast & Rogers, New York City.

The routine business was followed by a paper on "Some Practical Details of Water-Works Management," by Edwin Darling, Superintendent of Water-Works at Pawtucket, R. I., which dwelt briefly and in a common-sense fashion upon the following points—viz.: The need that works should be well planned and well built, of a corps of efficient workmen, and of a compensation to employees sufficient to stimulate an interest in their work; the care and protection of main-pipes and gates, the care and location of hydrants to make them efficient for fire service, the examination of service to prevent waste, the maintenance of the purity of the supply, the duties of the superintendent and the relation which should exist between him and the water commissioners, the relations of the municipal authorities to the water department, and finally the good results which follow when the water works managers are properly sustained by the city or town officials. The evils of political interference in the conduct of any water department were strongly stated. The work now being done by the Massachusetts State Board of Health in the efforts to preserve the purity of inland waters was highly commended.

Mr. Darling's paper provoked an interesting discussion by Messrs. Clark, Richards, Walker, Hall, Kent, Tidd, Noyes, and Billings, which centered mainly upon hydrant details.

Nearly all of the replies to a question by Mr. Walker, of Manchester, as to whether the first cost of a special service should be paid for by the water department or by the consumer, were, in effect, that the consumer should bear the expense.

WEDNESDAY EVENING.

The report of Committee on Exchange of Sketches included a folio of twenty-six blue prints giving the general plan and primary statistics of as many different water-works, and arrangements were made by which the Secretary will furnish duplicate copies of this folio to members at five cents per sheet.

In the absence of the author, a paper upon the Water Tank at Fall River, Mass., by Patrick Kieran, Superintendent, was read by the junior editor. The paper was illustrated by a tracing of the structure and called out a discussion by Tidd, Parker, Hawes, Stacey, Kent, and Fuller.

A report from a Committee on Uniform Classification of Water Rates, written by A. H. Howland, Chairman, was read by the Secretary. The paper was a lengthy one.

Six different bases for classification were suggested, in what, to the writer, seemed to be the order of their value—viz.:

1. A minimum charge per family without any limitation.
2. Number of stories and height of building.
3. The assessed valuation of the property supplied.

4. The number of front feet in the lot.
5. The number of persons in the family.
6. The number of rooms occupied by the family.

THURSDAY MORNING.

The Nominating Committee reported the following list of officers, and the choice of the committee was unanimously ratified by the convention: President, Superintendent Edward Darling, Pawtucket, R. I.; Vice-Presidents, Superintendent Desmond Fitzgerald, Boston; Superintendent Willard Kent, Woonsocket, R. I.; Superintendent C. K. Walker, Manchester; Superintendent F. H. Parker, Burlington, Vt.; Superintendent George P. Westcott, Portland, Me.; Superintendent J. C. Broatch, Middletown, Conn.; Secretary, R. C. P. Coggeshall, New Bedford, Mass.; Treasurer, Water Registrar A. S. Glover, West Newton, Mass.; senior editor of *Water-Works Journal*, Professor George F. Swain, of Massachusetts Institute of Technology; junior editor, Superintendent William R. Billings, Taunton, Mass.; Executive Committee, Superintendent F. E. Hall, Quincy, Mass.; Superintendent Walter H. Richards, New London, Conn.; City Engineer, A. F. Noyes, West Newton, Mass.; Finance Committee, Water Registrar George E. Batchelder, Worcester, Mass.; Water Registrar Phineas Sprague, Malden, Mass.; Water Registrar James H. Hathaway, New Bedford, Mass.

It was voted to pay the secretary a salary of \$300 per year.

A congratulatory and fraternal telegram was received from the President of the American Water-Works Association, Mr. B. F. Jones, of Kansas City, Mo., to which the secretary was instructed to make a fitting reply.

A lengthy paper on the Water-Works of Ware, Mass., illustrated by photographs and blue prints, was read by F. L. Fuller, C. E., of Boston, and before the reading of the next paper the Committee on Exchange of Sketches distributed rolls of blue prints, each containing sketches upon the following subjects:

1. Mains and Connections at Pumping-Station.
2. Mains and Connections at Distributing Reservoir, by R. C. P. Coggeshall.
3. Vise for Making Cup-joint, A. B. Drake.
4. Blower and Lamp, H. W. Rogers.
5. General Plan of Works.
6. Reservoir Dams.
7. Diagram of Consumption, Edwin Darling.
8. General Plan of Marlboro Works, George H. Stacey.
9. Service-Box, Willard Kent.
10. Water-Tank, W. F. Codd.
11. Temporary Weir, William B. Sherman.
12. Automatic Air-Value, M. M. Tidd.
13. Watering-Cart Hydrants, W. H. Richards.
14. Dams and Embankments, W. H. Richards.
15. High-Service Motor, F. H. Parker.
16. Meter Attachment for Watering-Carts, National Meter Company.

The paper upon a High-Service Motor, by Mr. F. H. Parker, of Burlington, Vt., was listened to with great interest, and called attention to a machine quite unique in its design, purpose, and conditions.

The pressure of water to work the motor varies from $2\frac{1}{2}$ to 5 pounds per square inch, while the pressure against the pump with full tank is 86 pounds per square inch. The motor is in the line of main pipe; works with slight friction and with no shock; offers no resistance to supply of water in either direction; wastes no water, and is practically automatic.

Mr. James H. Hathaway, of New Bedford, read a short paper upon "Methods of Collecting Water-Rates," and the convention adjourned for dinner.

THURSDAY AFTERNOON.

The opening paper was upon Ashland Basin, No. 4, and the mixing and handling of concrete, by W. F. Learned, C. E., of Watertown, Mass.

The paper was finely illustrated by drawings, was listened to with great interest, and a lengthy discussion ensued until it was suggested by Mr. Billings that it be postponed until evening to allow the reading of the next paper on the programme, which was upon "Aeration and Filtration," by Charles B. Brush, C. E., of Hoboken, N. J., and which, in the absence of Mr. Brush, was read by Mr. Billings.

This paper was suggestive and valuable and called forth remarks from Mr. Fitzgerald, of Boston, and a very brilliant address from Professor A. R. Leeds, of Hoboken, N. J., and at the conclusion of his address a vote of thanks was tendered Professor Leeds for his timely remarks.

THURSDAY EVENING.

The time was devoted to a general discussion upon a variety of topics, and the following gentlemen were elected as members of the association:

Active Members.—L. Frederick Rice, C. E., Boston, Mass.; S. S. Coolidge, C. E., Engineer, Council Bluffs, Iowa; Professor Albert R. Leeds, Stevens Institute, Hoboken, N. J.; Solon M. Allis, Superintendent, Malden, Mass.; Winthrop M. Pitman, proprietor, North Conway, N. H.; A. E. Stearns, Water Registrar, Manchester, N. H.

Associate Members.—Prov. Cyl. Co., Providence, R. I.
Honorary Member.—Henry C. Meyer, Editor of THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

After discussing general topics the president said that the question of the place for the holding of the next meeting was before the house. On motion of Mr. Darling, of Pawtucket, R. I., Providence, R. I., was selected as the location of the next annual meeting. The question of the place for the holding of the fall meeting was then brought up, and on motion of Mr. Noyes, of Newton, Mass., it was voted that the matter be left with the Executive Committee. On motion of Mr. Darling, a vote of thanks was extended to his Honor Mayor John Hosley, for the cordial welcome he had given to the convention. And also that the same be extended to Superintendent Charles K. Walker for the consideration he had had for the comfort of the members. Mr. Hawes, of Fall River, Mass., then read a special vote of thanks to be extended to Mr. Walker, which, with much applause, was made unanimous. Mr. Walker made a short reply, and followed it up by stating the arrangements for to-day's festivities at the pond. Vote of thanks were then extended to President Henry W. Rogers, for the impartial manner with which he had conducted his office during the year, to the Vice-President of the present Convention and its Secretary for the manner with which they had conducted their respective offices. At this point Mr. Darling took the chair and began his term of office as President of the Association for the ensuing year. He said: "I thank the Convention for the honor placed upon me and will try to conduct the office to the best of my ability. I bespeak the hearty co-operation of all in the coming year, and hope that the association will be as prosperous in the future as it has been in the past." Then, on motion of Mr. Noyes, of Newton, a vote of thanks was extended to the board of editors of the *Journal*. After a few well-received remarks from Professor A. R. Leeds, of Hoboken, N. J., the convention adjourned at 9:30 o'clock.

The following members and guests were present: Robert C. P. Coggeshall, Supt., New Bedford, Mass.; Wm. R. Billings, Supt., Taunton, Mass.; Chas. K. Walker, Supt., Manchester, N. H.; Arthur E. Stearns, Water Registrar, Manchester, N. H.; Frank E. Hall, Supt., Quincy, Mass.; James H. Hathaway, Water Registrar, New Bedford, Mass.; Albert S. Glover, Water Registrar, Newton, Mass.; Jonas M. Clark, Supt., N. Hampton, Mass.; W. H. Richards, Supt., New London, Ct.; Chas. H. Baldwin, Natl. Meter Co., Boston, Mass.; Edwin Darling, Supt., Pawtucket, R. I.; R. M. Gow, Supt., Medford, Mass.; M. M. Tidd, C. E., Boston, Mass.; Willard Kent, Supt., Woonsocket, R. I.; W. C. Wilcox, ex-Water Registrar, Waltham, Mass.; A. G. Pease, Supt., Spencer, Mass.; Nathl. Dennett, Supt., Somerville, Mass.; M. C. French, Supt., Kingston, Mass.; J. H. Gamwell, Supt., Palmer, Mass.; S. S. Coolidge, Commissioner, Belknap Falls, Vt.; Geo. E. Batchelder, Water Registrar, Worcester, Mass.; John G. Brady, Commissioner, Worcester, Mass.; John C. Kelley, Natl. Meter Co., N. Y. City; H. B. Winship, Ludlow Valve Co., Norwich, Ct.; Richard Partee, Holyoke Hydrant Works, Holyoke, Mass.; C. W. S. Seymour, Superintendent, Hingham, Mass.; W. H. Thomas, Commissioner, Hingham, Mass.; George J. Ries, Superintendent, Weymouth, Mass.; A. B. Drake, City Surveyor, New Bedford, Mass.; William E. McClintock, City Engineer, Chelsea, Mass.; William M. Pitman, Commissioner, Lower Bartlett, N. H.; Phineas Sprague, Water Registrar, Malden, Mass.; William B. Sherman, Secretary Corliss Engine Company, Providence, R. I.; George H. Frost, *Engineering News*, New York City; Phineas Ball, C. E., Worcester, Mass.; James E. Beals, Registrar, Middleboro, Mass.; William F. Codd, Superintendent, Nantucket, Mass.; George A. Stacy, Superintendent, Marlboro, Mass.; David B. Kempton, Commissioner, New Bedford, Mass.; F. H. Parker, Superintendent, Burlington, Vt.; Jason Giles, Chapman Valve Manufacturing Company, Boston, Mass.; E. L. Buss, Chapman Valve Manufacturing Company, Boston, Mass.; Robert J. Thomas, Superintendent, Lowell, Mass.; Albert F. Noyes, City Engineer, Newton, Mass.; Geo. E. Winslow, Superintendent, Waltham, Mass.; C. W. Morse, Superintendent, Haverhill, Mass.; G. B. James, Jr., Commissioner, Haverhill, Mass.; Frank L. Fuller, C. E., Boston, Mass.; Dexter Brackett, Assistant City Engineer, Boston, Mass.; Desmond Fitzgerald, Superintendent Western Division, Boston; W. F. Learned, Engineer Water-Works, Boston; F. P. Stearns, Chief Engineer Massachusetts State Board of Health, Boston, Mass.; A. H. Brodick, Chadwick Lead-Works, Boston; H. W. Humphrey, Commissioner, Weymouth, Mass.; H. A. Nash, Commissioner, Weymouth, Mass.; W. H. Foster, Whittier Machine Company, Boston, Mass.; James P. Roberts, ex-Pumping Engineer, Lowell, Mass.; J. T. Murphy, Commissioner, Marlboro, Mass.; R. D. S. Mortimer, Commissioner, Marlboro, Mass.; B. Frank Polsey, Walworth Manufacturing Company, Boston, Mass.; W. T. Dotters, Superintendent, Winchester, Mass.; F. F. Forbes, Superintendent, Brookline, Mass.; Solon M. Allis, Superintendent, Malden, Mass.; G. A. Polsey, Sumner & Goodwin, Boston; George E. Evans, ex-City Engineer, Lowell, Mass.; Benj. S. Babcock, Superintendent, Nashua, N. H.; R. K. Yates, Superintendent, Northboro, Mass.; Edward H. Rice, Walworth Manufacturing Company, Boston; A. N. Hyde, Jr., Superintendent, Newton, Mass.; M. A. Ewell, Commissioner, Haverhill, Mass.; Weaver Osborne, Commissioner, Fall River, Mass.; William M. Harris, Commissioner, Fall River, Mass.; Patrick Kieran, Superintendent, Fall River, Mass.; W. W. Robertson, Registrar, Fall River, Mass.; L. L. Fuller, ex-Commissioner, Malden, Mass.; Professor Albert R. Leeds, Stevens Institute, Hoboken, N. J.; L. C. Lamphear, Davidson Steam-Pump Co., Boston, Mass.; George Woodman

DR. WOOLSEY JOHNSON.

DR. WOOLSEY JOHNSON, Health Commissioner of New York City, died in the New York Hospital, of which he had been an inmate for more than a month, on Tuesday, June 27, aged forty-five years. His death was caused by chronic diffuse nephritis and diabetes from which he had been suffering for several months. Dr. Johnson was graduated from Princeton College, and began the study of medicine with his uncle in Albany, N. Y. Coming to New York City to complete his studies, he was graduated from the College of Physicians and Surgeons in 1863. He then went to Europe and spent more than a year in study at Paris and at German Universities. On his return to this country he was married and began the practice of his profession, giving special attention to the eye and ear. He was surgeon of the New York Eye and Ear Infirmary and consulting physician at the New York Hospital, as well as medical examiner for some insurance companies. Dr. Johnson was a member of the County Medical Society, Academy of Medicine, the Laryngological Society, and the Physicians' Mutual Aid Association. He was also a member of the Manhattan, Century, and University Clubs. Dr. Johnson was appointed Health Commissioner by Mayor Grace in 1881, on the expiration of the term of Dr. E. G. Janeway. His wife died some two years ago. His health failed soon after her death and he went to Europe last summer, returning unimproved late in the fall. His term as Health Commissioner expired on May 1, but Mayor Hewitt had not yet appointed his successor.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

ENGINEERING ADVICE WANTED.

WALLA WALLA, WASH. T., June 10, 1887.

SIR: Will you oblige me with an answer to the following: We have a little village situated at the mouth of a cañon through which flows a creek. Our idea of the best plan of supplying water to the village is to take the water from the creek, about a mile and a quarter above the village, and carry it by means of iron pipe placed along the bluff of one side the cañon to a hill just back of the village, in which a cistern or reservoir is to be dug to hold the water, which is from there to be distributed through the village by ditches and pipes. Our belief is that with a topography, as above given, such a method of supplying the village with water is the cheapest and the best. Are we, in your superior judgment in such matters, correct in that belief? In placing the pipe along the bluff to carry the water to the reservoir, there are some rocky places to the sides of which, we judge, the pipe will some way have to be attached or hung? What is a cheap and substantial way of doing this?

If you have a back number of your publication giving information on methods of supplying water and constructing the plant for a place situated as is our village, will you please send it to me? Thanking you in anticipation, I remain yours, etc., R. H. W.

[In reply to our correspondent we can only say that his general outline of a scheme seems feasible; but to avoid mistakes in detail, it always pays to employ some competent engineer to work up a plan, and it is poor economy not to employ one.

As to sustaining the pipes along a rocky face, wrought-iron brackets can be secured by leading into suitably prepared holes, or by "foxed" bolts.

Only general directions can be given, and each individual case must be treated according to its particular conditions.]

EXPLOSION OF WROUGHT-IRON OR STEEL TUBULAR BOILER.

KANSAS CITY, MO., June 15, 1887.

SIR: Do you know of a case where a wrought-iron or steel tubular boiler, used for low-pressure steam-heating exclusively, exploded? An answer in your valuable paper will very much oblige yours, A SUBSCRIBER.

[We know of no case in the history of low-pressure heating. Now and then a boiler is burned out and ruined by carelessness, but this applies to all classes of boilers. In the monthly report of the Hartford Boiler Insurance Company there once in a while appears a notice of a heating boiler blowing up, but a study of the case shows they are boilers in either workshops, depots or mills that presumably carry high-pressure steam, the water from which is wasted through traps or otherwise. They also usually occur at night-time when in the care of a watchman or under banked fires in the absence of any attendant.

The safety of a low-pressure gravity apparatus lies in the fact that the radiating surface is nearly always great enough to condense all the steam formed, and that with the increase of pressure the condensing surface (radiators) increase in condensing power, so that the safety-valve (though it may be small and poor) is usually able to cut off any steam the boiler may chance to make, above that which the heaters are able to condense, and keep the pressure below the dangerous point.]

NATIONAL MEETING OF THE MASTER CAR-BUILDERS' ASSOCIATION AT MINNEAPOLIS.

(By Our Special Correspondent.)

MINNEAPOLIS, MINN., June 18, 1887.

THE "Twin Cities"—St. Paul and Minneapolis, as they are called—are becoming more and more each year places where annual conventions and meetings of national bodies are held, and during this week just passed, the Master Car-Builders' Association of America has been holding the interesting sessions of its annual gathering. The sessions began Tuesday with an address of welcome by Mayor Ames, who spoke of the association as being one of the civilizers of the world. President B. K. Verbruyck, of Chicago, responded briefly, and then read his annual address, which was quite short. In it he called attention to the experiments which had been made during the year with automatic brakes and couplings, and said that the tests had been very thorough and that there ought to be at least one kind found that would be satisfactory to the trunk lines and to the Railroad Commissioners.

Secretary M. N. Forney, of New York, presented his annual report, which showed a membership in 1886 of 148 active, 81 representative, and 2 associate members, a total of 231, as against 223 in 1885. The number of cars represented in the association in 1886 was 580,056, as against 486,882 in 1885, and the view was put forth that there will be a marked increase in the number of cars this year. The receipts for the year were \$3,962.16; disbursements, \$3,275.53. The President announced the following committees:

Nominations—Robert Miller, Detroit; C. A. Smith, Jersey City; George Hockney, Elizabeth, N. J.; J. N. Barr, Milwaukee; George F. Wilson, Minneapolis.

Subjects for Investigation—Joseph Wood, Fort Wayne, Ind.; William McWood, Montreal; E. B. Wale, Columbus, O.

Correspondence and Resolutions—L. G. Matthews, Jeffersonville, Ind.; J. C. Barber, Brainerd, Minn.

To Select Place for Next Annual Meeting—W. F. Turrett, Cleveland, O.; H. Wilbur, Bethlehem, Pa.

Members of the Interstate and State Railroad Commissions were invited to participate in the deliberations of the association. The Secretary read correspondence relative to the Christie brake shoe, which has been adopted as the standard of the association. The general sentiment of the members was that no revision of the standard was advisable. The report of the committee on automatic brakes for freight-cars was read by G. W. Rhodes, of Aurora, Ill., describing in detail tests made with the Westinghouse, Carpenter, Ames, Hansenn, Curd, and other brakes. Among the points brought out were—that there is no mechanical difficulty in getting any amount of power required, the main trouble being getting a quick application of the power; that electrical appliances, properly devised and managed, may be made practical and valuable adjuncts, and that the best type of brake is one operated by air with the valves operated by electricity. The sub-committee of the executive committee presented a report on car-couplers, recommending the Janney type as the standard. The first business of the session of Wednesday was the election of officers, which resulted as follows:

President, William McWood, Grand Trunk Railway, Montreal, Can.; First Vice-President, J. W. Cloud, New York, Lake Erie, and Western road, Buffalo, N. Y.; Second, E. W. Grieves, Baltimore and Ohio, Baltimore, Md.; Third, John S. Lentz, Pennsylvania and New York Canal and Railway Company, Parkerton, Pa.; Treasurer, John Kirby, Lake Shore and Michigan Central, Cleveland, O.; Executive Committee, Joseph Wood, Pennsylvania Co., Fort Wayne, Ind.; R. D. Wade, Richmond and Danville Railroad, Richmond, Va.; T. A. Bissel, New York Central Sleeping-Car Co., Buffalo, N. Y.

An animated discussion arose out of the proposition to raise the settlement prices for new cars and trucks ten per cent. The proposition failed to receive the requisite two-thirds vote, as did another one to raise the settlement price of cars scheduled at \$450 to \$500. The list was finally referred to a committee for revision, and its report was adopted. The result will be that the prices of eight-wheeled cars will be raised from \$5 to \$25, according to classification. Box stock-cars, according to the new schedule, will cost \$475 where trucks with wooden transoms are used, and similar cars under thirty-two feet will cost \$440. No change was made in the prices for four-wheeled cars. The report was adopted. The report of the committee recommending the Janney type of coupler was then taken up. Mr. Rhodes favored this coupler, and referred at length to the experiments made at Burlington, Ia., on which the report of the committee was based. Mr. Miller thought the report went too far, and its adoption would force all the railways to adopt the Janney coupler. L. S. Coffin, one of the Railroad Commissioners of Iowa, who was never known to resist an invitation to speak on any topic in any assemblage, volunteered the statement that if God spared his life, and gave him the ability, he

would arouse the State of Iowa to such an extent that the legislature would see the necessity of action. He said that Iowa would not see her young men cut down at the rate of 200 a year when such slaughter could be averted. Mr. Stone proposed an amendment favoring the Miller-Cowel and link type and it was lost. The report of the committee was then adopted. The last day's session was divided between business and pleasure. The first business was the hearing of the report of the committee on accidents to trainmen. Taking as a basis the reports of the railroad commissioners of Massachusetts, New York, and Michigan, the committee estimated the number of railroad employees killed in the United States each year at 1,426, and the number injured at 6,548. Nearly one-half of the injuries are from coupling cars, but the percentage of fatal accidents from that cause is only 13; 27.4 per cent. are killed by falling from trains and engines, while only 18.5 per cent. of the injuries come from the latter cause. The committee regarded it as still an open question whether the use of automatic couplers had reduced the proportion and number of coupling accidents, and suggested improvement and uniformity of non-automatic draw-gear. An interesting discussion followed. Mr. Adams urged that the time had come for the association to take action on the matter looking to greater safety for the trainmen, and he would be sorry to see the association dodge the matter. He was of the opinion that the question was not one of new appliances—automatic or otherwise—but if the railroad companies would keep up in repair and use the appliances they now have, the loss of life and limb would be much less than at present. He thought the old pin-coupler, with an appliance for handling, would be safer than many of the automatic couplers. Mr. Cloud said that a good many of the accidents to trainmen were due to shocks and jerks in the handling of trains, and laid stress on the need of greater care by the engineers in starting up. The report was finally adopted, and the committee continued to next year. The committee on standard draw-gear for non-automatic couplers favored the pocket-drawbar as standing unrivaled for safety and durability, and recommended the plans adopted by W. Kirby, of the Michigan Southern road. Report adopted. Eleven kinds of car-roofs were reviewed by the committee on that topic, no special one being recommended. The president appointed John Kirby, of the Lake Shore and Michigan Southern; J. N. Barr, of the Chicago, Milwaukee and St. Paul, and Geo. F. Wilson, of the Minneapolis and St. Louis, a committee to represent the association in the car-wheel convention. The subject of car-heating and lighting was continued for another year in view of the many experiments now being made. The association chose Alexandria in the Thousand Isles as the place of next annual meeting. The Executive Committee re-elected M. N. Forney, of New York, as Secretary. The association adjourned *sine die*. In the afternoon of Thursday an excursion was made to Lake Minnetonka. Many of those present will attend the annual convention of the Master Mechanics' Association of the United States, which meets this week in St. Paul. The complete list of those who have been in attendance upon this convention is as follows:

Adams, F. D., Alston, Mass.; Adams, J. L., Huntington, Ind.; Ames, La Mott, Beech Creek, Jersey Shore, Pa.; Armbruster, Joseph, Knoxville, Tenn.; Avery, E. A., Grand Junction, Iowa; Baker David H., N. J.; Ballentine, D. W., Portsmouth, Va.; Barber, J. C., Brainerd, Minn.; Barnes, H. A., Stevens Point, Wis.; Bissell, Thomas A., Buffalo, N. Y.; Boatman, Vincennes, Ill.; Bryan, H. S.; La Crosse, Wis.; Buchanan, William, New York; Bushnell, R. W., Cedar Rapids, Iowa; Butler, C. I., Corning, N. Y.; Chapman, T. L., Richmond, Va.; Cloud, John W., Buffalo, N. Y.; Coghlan, John, East Boston, Mass.; Cooke, Allen, Danville, Ill.; Cushing, G. W., St. Paul, Minn.; Davis, James A.; Napanee, Deseronto, Ont.; Davenport, W. R., Pennsylvania; Demarest, G. W., Duncan, T. G., Cincinnati; Zaleski, Baltimore, Md.; Ellis, E. W., company, Chicago; Ennis, W. C. Wortendyke, N. J.; Ettenger, George W., Richmond, Va.; Finlay, L., Arkansas; Fletcher, John B., St. Albans, Vt.; Forney, M. N., New York; Forsythe, William, Aurora, Ill.; Foster, W. A., Corning, N. Y.; Gramling, G. H., Charleston, S. C.; Grieves, E. W., Baltimore, Md.; Griffith, Fred B., Buffalo, N. Y.; Hackney, Clem., Omaha, Neb.; Hackney, George, Topeka, Kan.; Haines, S. W.; Pittsburg, Pa.; Harris, George II., Columbus, Ohio; Harrison, W. H., Baltimore, Md.; Haslett, C. A., Chicago, Hatch, William B., St. Albans, Vt.; Hill, John, St. Paul, Minn.; Hitchcock, Robert, Springfield, Mass.; Hobart, C., Portland, Oreg.; Hodge, John, St. Louis, Mo.; Hunter, David W., Valley Falls, R. I.; Hurlbut, Francis B., Palatka, Fla.; Irvin, Samuel, Sedalia, Mo.; Jackson, Job H., Wilmington, Del.; Johns, C. T., Ohio; Keeler, Sanford, East Saginaw, Mich.; Kirby, John, Cleveland, Ohio; Lentz, Packerton, Pa.; Lyons, Henry D., Marquette, Mich.; McCarthy, H. C., Williamsport, Pa.; McIlwain, J. D., London, Ont.; McKenna, Robert, Scranton, Pa.; Mackenzie, John, N. Y., Cleveland, Ohio; Marden, J. W., Boston, Mass.; Martin, M. M., Decatur, Ill.; Mathews, L. G., Jeffersonville, Ind.; Sargent, George M.; Miller, Robert, Detroit, Mich.; Mills, C. W., Rochester, N. Y.; Nelson, E. D., Williamsport, Pa.; Packard, L., West Albany, N. Y.; Palmer, A. G., Jersey Shore, Pa.; Potts, Robert, St. Thomas, Canada; Pratt, Elias E., Boston, Mass.; Preston, H. L., St. Paul, Minn.; Rasmond, J. H., Chicago, Ill.; Rhodes, Godfrey, Richardson, David C., Lawrence, Mass.; Richardson, John, Ludlow, Ky.; Richardson, William J., Brooklyn, N. Y.; Roberts, H., Detroit, Mich.; Robertson, W. J., St. Albans, Vt.; Rowe, H. S., Portland, Ore.; Scott, W. A., Chicago, Ill.; Shel-

don, George O., New York City; Sheppard, Frank, Altoona, Pa.; Short, William A., Malone, N. Y.; Skinner, J. R., Oneota, N. Y.; C. A., Jersey City; Smith, Peter River, E. Rochester, New York; Snow, W. B., Chicago, Ill.; Stone, W. A., Louisville, Evansville, Ind.; South-erland, T., Detroit, Mich.; Surreff, W. F., Cleveland, Ohio; Verbruyck, B. K., Chicago, Ill.; Wade, R. D., Richmond, Va.; Wagner, J. L., Terre Haute, Ind.; Wall, E. B., Columbus, Ohio; Wallis, F. M., Philadelphia, Pa.; Webster, H. A., New York City; Welch, Benjamin, Sacramento, Cal.; Whitney, Henry A., Moncton, N. B.; Wilbur, Rollin H., Bethlehem, Pa.; Wilder, F. M., Binghamton, N. Y.; Wilson, George F., Minneapolis, Minn.; Wood, Joseph, Fort Wayne, Ind.; Choate, C. P., Detroit; Chase, W. K., Troy, Earle, E. T., Chicago; Hubbard, S. H., Chicago; Kent, John, Kittridge, A. M., Dayton, Ohio; Leighton, J. T., New York; Tippet, E. B., Louisville; Whitney, J. R., Chicago; Whittaker, A. C., Wheeling, W. Va.; Ward, C. F., St. Paul.

CONVENTION OF THE NATIONAL ASSO- CIATION OF MASTER PLUMBERS.

(From our own Correspondent.)

THE National Association of Master Plumbers of the United States met in Chicago, Ill., on June 21, at 10 o'clock in the ladies' ordinary of the Grand Pacific Hotel. James Allison, president of the association, accompanied by Andrew Young, Chairman of the Reception Committee, occupied the platform, and the latter spoke a few words of welcome to the convention in behalf of the city and the local association. "We will try and make it as pleasant as possible for you during your stay and we hope you will make it long."

President Allison having expressed thanks for the greeting, proceeded: "I can hardly express my pleasure and satisfaction at seeing so great a number present to-day, which shows conclusively that no interest in our work is slighted. I appreciate this, I assure you, on my own part and in behalf of the National Association. I am satisfied that your visit here will be a pleasant one, and I have no doubt a profitable one both for yourselves and the public. And now, as we are here for business, I will not waste words further, but at once proceed with the regular order of work. First in order will be the election or appointment of a Credential Committee. What is your pleasure, gentlemen?"

William McCoach, of the Common Council, Philadelphia: "I move the chair appoint the Credential Committee. So ordered, and President Allison named J. J. Wade, of Chicago; George Knipp, of Baltimore; M. Goss, of Kansas City (in whose absence Mr. McCarthy, of Kansas, was substituted); Mr. Wright, of Philadelphia. A short recess was taken pending the report.

The Credential Committee announced, through Secretary O'Neill, the following lists of delegates present and duly accredited, and as the roll was called they marched to the seats assigned them, the chairman of each delegation carrying the extemporized banner, in lieu of the silken emblems lost at Deer Park;

Alton, Ill., one representative—P. J. Kane.
Boston, Mass., nine representatives—John H. Stevens, President; Isaac Riley, John Crawford, William H. Mitchell, D. G. Finnerty, James F. Dacey, Thomas J. Tute, Frank A. Titus, E. G. Perkins.

Baltimore, Md., nine representatives—John McCart, President; William Dunnnett, D. B. Foster, George Knipp, William H. Rothrock, James Connelly, John Trainor, Joseph C. Mitchell, James Millar, Jr.

Brooklyn, N. Y., seven representatives—Mortimer J. Lyons, President; T. H. Radcliff, H. M. Noble, W. T. Hudson, J. J. Keenan, O. Merrin, D. Fragan.

Beatrice, Neb., one representative, Frank Barclay.
Bloomington, Ill., two representatives—Frank Morrison, George McIntosh.

Burlington, Iowa, one representative, Henry Erwinger.
Chicago, Ill., eighteen representatives—Robert Griffith, President; A. W. Murray, Martin Moylan, William Sims, T. C. Boyd, Hugh Watt, Michael Ryan, D. J. Rock, David Whiteford, William Bowden, Rupert Coleman, P. Sanders, J. R. Alcock, M. J. Corboy, J. J. Wade, Andrew Young, William Wilson, Thomas O'Malley.

Jacksonville, Ill., one representative—George E. Matthews.

Cincinnati, O., six representatives—Robert Carlisle, President; Richard Murphy, J. A. Gibson, Stephen J. Nolan, James Allison, Thomas McNeill.

Cleveland, O., three representatives—George S. Paine, President; Charles C. Dewstoe, Peter Desnoyers.

Columbus, O., two representatives—William Halley, President; E. A. Futerer.

Canton, O., one representative—L. B. Cross.
Decatur, Ill., one representative—Philip Mueller.

Denver, Col., three representatives—Thomas J. White, William McCarthy, William Crane.

Davenport, Iowa—James Cameron.

Detroit, Mich., four representatives—James Meathe, President; James Lane, John Cameron, J. H. Crumley, Richard Walsh.

Flint, Mich., one representative—Edwin Sterner.

Fort Wayne, Ind., two representatives—Thomas Mad-den, P. E. Cox.

Freeport, Ill., one representative—Charles Stetson.

Hampden County, Mass., one representative—C. P. Lyman.

Hudson County, N. J., three representatives—Joseph Zumbusch, James F. Blackshaw, I. W. Littell.

Nashville, Tenn., one representative—J. L. Park.

Bloomington, Ill., one representative—Robert Loudon.

Kansas City, Mo., four representatives—Henry Goss, President; J. L. Ryle, W. G. Ashdown, R. B. Farley.

Kansas State Association, four representatives—J. Giles Smith, Wichita; John E. Ford, Newton; J. J. Sheehan and William F. McCarthy, Topeka.

Louisville, Ky., four representatives—M. J. Duffy, President; W. H. Matlack, Thomas P. Watts, Simon Shulhafer.

Madison, Wis., one representative—Thomas Regan.
Milwaukee, Wis., five representatives—William E. Goodman, Hermann C. Apel, George S. Lyons, George A. Spence, Charles Polachek.

Minneapolis, Minn., three representatives—E. C. Cauvet, J. S. Cusick, A. W. Scott.

Lincoln, Neb., one representative—James H. O'Neill.

New York City, twenty-four representatives—John Byrnes, President; George D. Scott, Joseph A. Macdonald, William Young, Frank Reynolds, E. J. O'Connor, W. H. Quick, John Miller, J. N. Knight, Alexander L. Whitelaw, T. J. Tuomey, Philip Smith, T. J. Cummings, Timothy Sullivan, C. H. Kranichfelt, Jonas A. Rossman, George B. Brown, Cauldwell Frazer, H. G. Gabay, John J. Sullivan, Edward J. Brady, Thomas Cochrane, James Fay, William Austin.

New Haven, Conn., two representatives—Andrew J. Clerkin, Franklin A. Curtis.

Norfolk, Va., one representative—William E. Foster.

Omaha, Neb., one representative—John Rowe.

St. Louis, Mo., thirteen representatives—Jeremiah Sheehan, President; David Roden, William H. Graham, James A. Lynch, Thomas Cantwell, A. Boyce, William Norris, James McCartin, John Quinn, O. J. Gerhard, P. C. Ring, T. H. McMahon, J. F. Reardon.

St. Paul, Minn., three representatives—John H. Shea, George Dempsey, J. J. Dunnigan.

Pittsburg, Pa., five representatives—John M. Tate, President; Washington Jarvis, Robert J. Bradshaw, Louis Heilig, James J. Ricketts.

Philadelphia, Pa., seven representatives—William Harkness, Jr., Chairman; John J. Weaver, Enoch Remick, William M. Wright, H. A. W. Smith, J. Sellars Kite, William McCoach.

Providence, R. I., two representatives—George R. Phillips, Thomas Phillips.

Washington, D. C., three representatives—R. G. Campbell, President; E. J. Hannan, James Regan.

President Allison—I have the pleasure of announcing that there are 161 representatives present to-day, the largest number that has ever been gathered at one of our national meetings, which is certainly very gratifying to me, as I know it certainly must be to every member of our National Association. I now have the pleasure of declaring the convention duly assembled and ready for work. But before proceeding further I have one request to make, to beg your indulgence in the first place for any mistakes of mine, and that you will attend promptly, when adjourning, at the hours named for meeting again, and that you will preserve the very best order, so that we can facilitate our work and get through as quickly as possible, since I am told, after the work is over, the Chicago Association "have it in for you," as they say; I don't know what that means [laughter]. The Secretary has but one communication and that from San Francisco, and he tells me that in order to facilitate business, it being in an exceedingly fine hand, he has sent it to a type-writer.

Adjourned for dinner.

On reassembling, the convention was briefly addressed by George C. Prussing, of Chicago, who was introduced by the chair, as "the first instigator and first President of the National Builders' Association of the United States." Mr. Prussing said they were busy men met together for business, and while he appreciated such an introduction to a body so intelligent, they would yet excuse him from breaking in upon their programme at this time. He trusted to see them again.

Communications being in order, one was read from L. E. Ferman, President of the San Francisco Master Plumbers' Association, strongly favoring affiliation with the national body, and regretting the absence of Pacific Coast delegates at the convention. "We have done a great and good work here in California, and it has been the support of the National Association which has given us backbone and continues to strengthen us. The communication was placed on file.

H. G. Gabay, New York—I move that members, on rising to speak, announce their names. Carried.

Mr. Harkness, Philadelphia—If resolutions are in order I will present the following, passed by our association June 10: "That we request the National Association to insist that the plumbers of the country be classed as dealers by the manufacturers of terra-cotta pipe." Referred.

Reports of retiring officers being in order, Secretary Thomas McNeill, of Cincinnati, presented the record of the Executive Committee—how they had held four meetings, the first being at the New York association rooms, No. 54 Union Square, on October 4, when they met the State Vice-Presidents of the East, and took into consideration the trouble then existing in the metropolis and threatened throughout the country. "The result of that meeting was made known to you by a circular sent through State Vice-President T. J. Cummings, New York. At the second meeting, December 2, the president's nominees for committees were approved, the first half of the per capita tax called in, and the president authorized to call in the other half at his discretion. The labor troubles in our trade existing in New York, and of frequent occurrence throughout the country, received long

and careful consideration, when it was decided to communicate to each local association that their members should render the New York trade every assistance possible. The expenses of the Executive Committee, when on official business, were ordered to be paid by the National Association. The third meeting was with the New York association, President Byrnes in the chair, and again they met with the Observation Committee of the New York association, when the conclusion was expressed that nothing further could be done in that matter. The fourth and last meeting had just been held—the day before—in Chicago, all members present except Birkett, of Brooklyn, Mr. Wade, of Chicago, being chosen his proxy. The committee of metal-workers of the United States requested a conference with this committee, and this was granted, a meeting to take place the next day, Wednesday afternoon. Communications were received from Boston and Philadelphia, and action postponed until after this meeting with the metal-workers. T. C. Boyd stated that a committee of delegates from Chicago visited Milwaukee, and as a result of their visit the Milwaukee association is represented in this convention to-day [applause]. The thanks of the committee were presented to Mr. Boyd. The Executive Committee recommended the appointment of a committee by the National Association to buy goods at the lowest market rates for members of the association, also the similar appointment of a member thereof in every town to keep a record of all dealers and manufacturers, or master plumbers, violating any of the protection resolutions of this association, said committeemen to report to the convention. A modified order of business was adopted and bills audited amounting to about \$1,200. A resolution was passed approving the course of the New York master plumbers in maintaining that boys of America might learn the plumbing trade; also a resolution approving and adopting the code of principles set forth by that affiliated body, the National Builders' Association, at their Chicago convention in March."

The Chair—What is your pleasure regarding this report from the Executive Committee?

A. Young—I move the adoption, striking out all that part referring to purchasing goods at cost.

J. J. Weaver, Philadelphia—I move, as an amendment, that all the recommendations be referred to the Committee on Resolutions, when appointed, to report back to us tomorrow morning.

Secretary McNeill seconded the Weaver amendment and it was carried, simply the change in order of business being adopted immediately.

The Chair—As the Committee of Five on Resolutions I appoint Messrs. Byrnes, of New York; Hannan, of Washington; Rothrock, of Baltimore; Harkness, of Philadelphia, and Moylan, of Chicago.

On motion of Mr. White, Kansas City, all future resolutions were ordered to be offered in duplicate.

The secretary's own report was read by that official. He had visited Baltimore; also Cleveland, to help that association against the strike, and had their word for it that the visit was beneficial to them. During the year the membership of the National Association has increased to 1,359, a gain of 172 [applause]. "I have made a careful estimate of the master plumbers in this country, and place the number at 6,054, one-half of whom are in New York State, Massachusetts, Pennsylvania, and New Jersey. Only about one-fourth have any weight, and, as nearly all of these are now affiliated with us, we can carry out projects favoring the good of the whole craft. I thank all the members for personal kindness." Report accepted.

Mr. Weaver, of the stentorian voice, was asked by the chair to assist the secretary, suffering from a cold.

Financial Secretary Enoch Remick detailed the receipts from the \$2 per capita tax collected in two calls, and amounting to \$2,720, of which New York City paid \$450; Chicago, \$326; Brooklyn, \$254; St. Louis, \$180; Cincinnati, \$90, etc.

Treasurer M. J. Lyons, Brooklyn, in his third annual report, credited a balance of \$24.29 received at Deer Park, and total receipts of \$2,744.29, and now had a balance of \$869.10 [applause]. The account was ordered audited next day, the auditing committee at present having a sick chairman.

Inspector-of-Plumbing Lee, of Baltimore, being in attendance, was called up by the chair, introduced and seated with the other Baltimoreans, but no speech could be extracted from him.

Surrendering his seat to Vice-President John Trainor, of Baltimore, Mr. Allison submitted his report as chief executive.

On motion of Mr. Finnerty, Boston, seconded by Mr. Gabay, New York, the recommendations contained in President Allison's excellently received address were referred to the committee on resolutions, to report next day.

An invitation from Trustee Blatchford to visit the Chicago Manual Training School was, on motion of M. J. Corboy, Chicago, accepted, and the hour left with the Chicago entertaining committee.

Then came the reports of the State vice-presidents, meanwhile the committee on resolutions retiring, as also some others, to such an extent, indeed, that the segeant-at-arms, amid some amusement, complained he had much trouble to keep the convention out of the anteroom of lemonade frappe.

[We shall continue and complete our report of the convention in our next issue.—ED.]

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

Persons who make any use of the information they find in these columns we trust will not omit to mention **THE SANITARY ENGINEER AND CONSTRUCTION RECORD** as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 89-90-91-92.

WATER, SEWERAGE, ETC.

PENNSYLVANIA WATER COMPANIES.—Application is made to Governor Beaver for a charter for the Holmesburg Water Company, the object of which is to furnish a water-supply for Oxford and Lower Dublin townships. The subscribers to the act of incorporation are: Charles W. Stout, Furman D. Holmes, William Neill, Robert Johnson, Tustin Boileau, Charles Snyder, William B. Bunker, and Emerson Titus.

SOUTHBRIDGE, MASS.—A town meeting will be called to decide on sewerage.

GRAND HAVEN, MICH., will extend its water-works.

CALIFORNIA WATER COMPANY.—The Arroyo Taro Water Company has been formed to supply water to the upper Carpinteria Valley, Santa Clara County.

MARYSVILLE, CAL.—The new Marysville water company, the majority of whose \$1,000,000 of stock is owned by non-residents, proposes to take water from the O'Brien Ditch in a thirty-six inch pipe and deliver it in Marysville. It will supply power enough to run nearly all the machinery in Marysville.

PORT CHESTER, N. Y.—The trustees of Port Chester, at a special meeting June 17, authorized the committee on roads and bridges to enter into a contract with Freeman H. Merritt to build the proposed sewers for the village.

MERRILL, WIS.—Incorporated is the City Water-Works Company; capital, \$100,000.

WICHITA, KAN., Council is preparing for extensive drainage improvements.

WORCESTER, N. Y.—Our correspondent writes: "We have a company formed ('The Worcester Water Company'). Capital stock, \$35,000. We are now soliciting stock, which is as far as we have got. We have a fine natural reservoir located about one and one-half miles from the village with over 500 feet head."

NORTH MUSKOGON, MICH.—The Water Committee advertises for bids for water-supply, either by driven wells or some other system.

WHITE PLAINS, N. Y.—Governor Hill has signed a bill providing for a system of sewerage for this place.

RACINE, WIS.—3,000 additional feet of intake pipe for the water-works will be laid at once.

MINNEAPOLIS, MINN.—A pumping station will be built on Shingle Creek.

COLUMBUS, KAN., will construct a reservoir for the water-works. Address Long & Doubleday.

WESTFIELD, N. Y., proposes to obtain a supply of water from Chautauqua Creek. The expense is estimated at \$45,317.

ALBANY, N. Y.—The Water-Commission has returned to Andrews Bros. the form of contract by which the latter agree to furnish 100,000,000 gallons of water daily from driven wells. Meanwhile the report of the commission will be presented, with plans.

The Water Commission has sent its report to Common Council favoring a contract, at above price, with Andrews Bros.

COVINGTON, KY.—See our Proposal Columns for a reference to the construction of a water-works reservoir.

NORTH ATHENS, O., will have a supply of water from the Getty's Spring, which is estimated to yield 3,000,000 gallons daily.

MANKATO, MINN.—The Council Sewer Committee has just presented a report on sewerage, recommending that the plans of Messrs. Lewis & Curtiss, of St. Paul, be adopted. The system will be pipe sewers; estimated cost, \$17,000. No definite action was taken.

The City Engineer will lay new water-mains, costing \$5,000.

SACCARAPPA, ME.—Our correspondent writes: "There has been no action taken on water-works as yet, and I doubt of there being any until next March. At a special meeting held a short time since the matter was postponed."

ABINGTON, MASS.—The Big Sandy Water Service will be extended to West Abington as soon as possible.

MANITOU, COL.—The citizens propose to have water-works to cost \$30,000.

CARLINSVILLE, ILL., wants to have some party build water-works, stand-pipe system. Address the City Clerk, until July 15.

COLUMBUS, KAN.—Long & Doubleday will receive propositions for building water-works here.

ATHENS, GEO., wants water-works.

DARLINGTON, S. C.—Our correspondent writes: "We are contemplating water-works. We are now looking for a contractor for artesian wells, as in our locality that is the most practical way of obtaining a water-supply."

ANDOVER, MASS.—In March, 1886, the town voted to construct a system of water-supply for fire purposes, and about 7,500 feet of 8 and 10-inch iron pipe was laid, with 16 hydrants, at a cost of \$9,300. At the town meeting of March 7, 1887, \$5,000 was appropriated for the extension of the system for fire purposes, and \$1,000 for making surveys preliminary to the construction of a system for domestic, fire and other purposes—water to be taken either from Pump's or Haggett's ponds, in Andover, of about 100,000,000 and 600,000,000 gallons capacity respectively. A charter has been procured empowering the town to take water from said ponds.

WORCESTER, N. Y.—A company has been organized which is chartered by the State. The committee is now at work trying to raise a guarantee from the citizens for fire purposes, as the village is unincorporated.

WARSAW, N. Y.—The water-works have been bought by a New England company, and will be extended. The cost of the extension will be \$50,000.

KEARNEY, N. J.—The town has made an arrangement with the Jersey City Board of Public Works for a supply of water. Kearney to pay \$90 per 1,000,000 gallons. Mr. Davy is Chairman of the Water Committee of the Kearney Township Board.

ALTOONA, PA.—The Water Commissioners will employ a hydraulic engineer to gauge Homer Gap Stream, to make plans for a reservoir. The following resolution, passed by Council May 31, indicates just what the work will be:

"Resolved, by Common Council of the city of Altoona, Select Council concurring, that the Water Commissioners be, and they are hereby, directed to employ a competent hydraulic engineer to gauge the flow of the Homer Gap stream, and also procure plans and specifications of a reservoir at the proper elevation to give the highest point within the city at present a sufficient supply of water, said reservoir to hold not less than 50,000,000 gallons; also, to furnish an estimate of a line of pipe not less than sixteen inches from aforesaid reservoir to the city, and report the result of the same to councils at as early a date as possible. And it is further

"Resolved, That the Water Commissioners, in conjunction with the City Solicitor and Water

Committee of Councils, be, and they are hereby, directed to proceed to ascertain, at as early a date as possible, the cost of the right of way of Homer Gap stream; also, the right of way of line of pipe from said Homer Gap to the city, and report the same to councils as soon as possible."

SAN FRANCISCO, CAL., Council will pass on resolutions providing for the employment of two California engineers to prepare plans for sewerage.

FLUSHING, L. I.—The Board of Trustees on June 21 definitely ordered that proposals should be advertised for a 2,000,000-gallon pumping-engine. Address the Water Committee.

ALBANY, GEO., will have water-works and a street railroad.

PORTLAND, ME.—The Portland Water Company will build a reservoir on Manjoy Hill.

ATHENS, GEO., City Council is considering a sewerage system.

PORTSMOUTH, VA.—An agitation for a system of sewerage is begun.

WATERVILLE, N. Y., is agitating the water-works question, and has sent commissioners to Clinton and Richfield Springs to examine the works there.

ISHPENNING, MICH.—The common council has decided to employ an engineer to plan a system of sewerage. It is also proposed to build new water-works at Lake Sally.

WILLET'S POINT, L. I.—The United States Government has arranged to take a supply of water from the Flushing Water-Works. The Works will erect an auxiliary pumping engine. The Government has already obtained the iron pipe.

LAKE, ILL.—Chief Engineer Sprague has submitted to the Town Trustees specifications for two pumping engines, with a daily capacity of 8,000,000 gallons. The matter was referred to the committee of the whole.

WARSAW, ILL.—In reference to a report about water-works at this place, our correspondent writes: "No step has been taken to establish water-works here, but our citizens have subscribed money to bore an artesian well. We expect to have sufficient head for fire purposes."

WEST HOBOKEN.—See our proposals for reference to new sewer work.

GLEN PARK, COL.—A company with a capital of \$60,000 has organized for supplying Glen Park and Palmer Lake with water. A reservoir up the Monument Glen will store the water and large mains will conduct it to both towns, and at Glen Park there will be fire hydrants.

NORTH MUSKOGON, MICH.—The village officials have decided to sink about twenty drive-wells, and by so doing expect to increase their water-supply to about 500,000 gallons per day.

SOUTH FRAMINGHAM, MASS.—Governor Ames has signed the bill relating to the sewerage of this place, and Mr. S. C. Heald, of Boston, the Engineer, will prepare plans at once.

EAGLE RIVER, WIS.—The Eagle River Dam Company will construct a dam costing about \$5,000 two miles below Eagle River. Address Leander Choate, Oshkosh.

CLINTON, ILL.—The City Council on June 20 decided to establish water-works. Plans have been ordered prepared and sources of water will be investigated at once. The first cost will be about \$20,000.

FORT FAIRFIELD, ME.—Town meeting has voted to raise money to put in 30 hydrants for a water-supply.

FARMINGTON, ME.—A town meeting will be held to ratify a contract with the Water Company which has just been entered into by the village corporation.

TAUNTON, MASS.—The water-works authorities have received bids for the sinking of a number of wells to increase the water-supply.

ALLEGHENY, PA.—In reference to the reported removal of the water-works, the water committee has passed resolutions in opposition, and asking councils to abandon the project. The committee recommends the construction of a main sewer from the Eastern City line to a point below the water-works.

GREENVILLE, MICH., is considering the question of water-works.

MECHANICSTOWN, MD.—The Mechanicstown Water-Supply Company have decided to build their own works, which will be begun soon. Iron pipe will be needed.

THOMASVILLE, GA.—Proposals will be received until July 18, for building brick tower and tank for the Water-Works. For further information, address A. F. Prevatt, chairman water-works committee.

GAS, STEAM, BUILDINGS, ETC.

WEST TROY, N. Y.—The West Troy Gas-Light Company will receive the contract to light the village during the ensuing year.

NEWTON, KAN., will have a \$100,000 hotel.

MIDDLETOWN, N. Y.—Bids were received by the Village Trustees, June 14, for lighting the streets. The New York and New Jersey Globe Gas-Light Company offered to furnish seventy or more of their standard lamps with improved self-generating gas apparatus attached, giving a light equal in brilliancy to eighteen-candle power gas, for \$20.60 per lamp per year, the same to burn every night and all night. For a similar light until one o'clock A. M. every night, \$19.80 per lamp per year. If they were given a contract for two or three years they would perform the first-mentioned service for \$19.50 per lamp per year.

The Middletown Gas, Electric-Light and Fuel Company will furnish 35 to 50 electric lights, Voltaic arc system, to burn from early candle light until 1 A. M., every night, at \$182.50 per light per year; 10 additional lights at \$164.25 each. Or will furnish 15 to 30 lights, 20 to burn all night and every night, the remainder until 1 A. M., the former for \$237.25 per light per year, the latter at \$164.25; 10 additional lights if desired all night at \$219, or will furnish 25 to 50 lights, all night and every night, for \$200.75 per light per year; 10 additional lights, if desired, for \$182.50 each. The electric lights are to be what are known as "2,000 candle." The company light, extinguish, clean and supply with gas 70 to 100 lamps until 1 A. M. every night for \$23.80 per lamp per year, from 100 lamps up to 125 for \$22.80, above 125 for \$21.80. For all night and every night as above for \$32.80, \$31.20 and \$30.40. Will repair and maintain lamp-posts for \$1.50 per post per year. Lamp-posts to be fitted with burners consuming four cubic feet per hour. It is stipulated that for each light extinguished before the hour specified in the contract, the village shall deduct twice the amount the company would have been entitled to receive if such lamp had been lighted the whole night. The bids were referred.

WOBURN, MASS.—The Woburn Electric Light and Power Company, a new organization, was organized recently. N. J. Simonds, B. F. Whittemore, S. F. Trull, L. Thompson, and C. H. Buss are directors.

SOUTHBRIDGE, MASS., will have electric lights in the streets.

YANKTON, DAK.—The Electric Light Company intends to erect a plant, using the water from an artesian well for the power to drive the dynamos.

DENVER, COL.—Address J. J. Thomas & Co. who desire a natural gas-plant.

KEOKUK, IOWA.—Address George D. Rand in regard to a natural-gas company to be formed here.

KENOSHA, WIS., wants propositions for lighting the streets with gas or electricity.

ELECTRIC LIGHT COMPANY INCORPORATIONS.—The Southbridge, Mass., Electric Company. C. A. Dresser, Herman C. Wells, Andrew Hall and others.

The Jackson, O., Gas and Electric Light Company. Isaac Brown, H. L. Chapman, Moses Sternberger, T. J. Edwards, T. S. Matthews.

The Stockton, Kan., Electric Light and Power Company. James M. Wells, D. E. Miller, Atchison, Charles C. Woods, O. A. Higgins, and H. C. Reins.

The Paola, Kan., Electric Light and Power Company. J. W. Sponable, J. F. Donahue, H. M. McLachlin and others.

The Hays, Kansas City, Electric Light Company. Hill P. Wilson, M. J. R. Treat, Henry Oshaut, C. C. Brosius, and A. D. Gilleson.

The Dexter, Me., Electric Light and Power Company. Samuel S. Ireland and Levi Bridgeham.

SAN FRANCISCO, CAL.—The supervisors will contract with the California Electric Light Company for 8 mast lights.

CINCINNATI, O., has contracted with the Ohio Lighting Company for gasoline lamps at \$18.71 yearly per lamp, and 40 cents each for new posts.

NEWARK, N. J.—The Citizens' Freeman Electric Light Company has a proposition before the Board of Aldermen offering to furnish 2,000-candle-power electric lights for 20 cents per lamp per night.

CHICOPEE, MASS.—Thomas McDonnell, P. M. Judd, S. D. Stoddard, are of committee to investigate the electric-light question.

THE Manchester, N. H., Gas-Light Company's Works has been leased to the People's Gas-Light Company for 50 years, at \$32,500 per year.

FISKVILLE, TEX.—A company has been organized to bore for natural-gas.

SPRINGFIELD, MASS.—The Equitable Gas Company has applied for a franchise authorizing the laying of mains and supplying of gas.

JAMESTOWN, N. Y.—Address Orsino E. Jones, President of the Board of Trade, in regard to a natural-gas plant for this town.

FLORENCE, ALA.—A company with \$500,000 capital subscribed has been organized to build iron furnaces.

SEDALIA, MO.—The Empire Well Augur Company, of Ithaca, N. Y., has the contract for a gas-well here.

GRIFFIN, GEO.—It is proposed to build gas and water works here.

WABASH, IND.—It is reported that an Eastern syndicate has purchased the "Jumbo" gas-well at Fairmount, near here, and will lay pipe to Chicago.

STILLWATER, MINN.—The Stillwater Gas Company contemplate putting in a water-gas plant, at an expense of \$25,000.

CROOKSTON, MINN.—The contract for steam-heating and ventilating High School building has been awarded to the Porter Steam-Heating Company of Minneapolis.

RAILROADS, BRIDGES, CANALS.

CAIRO, MISS.—The iron-work for the bridge over the Ohio River will be made by the Union Bridge Company of Buffalo, N. Y.; price, about \$3,000,000.

RAILROAD.—The Marietta and North Georgia Railroad will be extended to Knoxville, Tenn. R. M. Pulsifer, of the Boston Herald, is interested.

RAILROAD.—A railroad will be built from Fort Wayne, Ind., to St. Louis parallel with the Wabash.

FLORIDA.—The incorporators of the Windsor, Lake Newnan and Prairie Creek Street Car, Canal and Navigation Company have for their object the operation of street cars in Windsor and steamboats on Newnan's Lake.

UNION SPRINGS, ALA.—It is proposed to build a street railway here.

RAILROAD.—The Tennessee Midland Railroad will build. Engineering parties are in the field. The principal office is in Memphis. A. S. Buford, of Richmond, Va., is President; R. H. Temple is Chief Engineer.

LITTLE ROCK, ARK.—An ordinance will be introduced at the next meeting of the City Council ordering the immediate construction of about fifteen miles of sidewalk.

The contract for grading Scott Street, between Seventeenth and Twenty-second, has been let to E. A. Weyd & Co. at nineteen cents per cubic yard.

THE Indiana and Lake Michigan Railroad, from South Bend to St. Joseph, is again projected.

NEW ORLEANS.—City Engineer Brosnan is preparing plans for paving a number of streets.

ALEXANDRIA, LA.—The Little Rock and Alexandria Railroad will be built. Colonel B. W. Johnson, of Little Rock, Ark., may be addressed.

LOS ANGELES, CAL.—Incorporated is the Los Angeles Cable Railway Company—capital, \$2,500,000—to build an extensive system of roads. Hon. J. F. Clark, S. P. Jewett, Charles Forman, and others are incorporators.

THE Buffalo, Rochester and Plattsburg Railroad will spend about \$1,000,000 in improvements.

RAILROAD.—The Oregon Pacific Railroad will be completed by New York capitalists. Rowland G. Hazard is one.

OAKLAND, CAL.—Burnham, Standeford & Co., of this city, have received orders for the construction of thirty-two cars for the new Powell Street Cable Road in San Francisco. The cost of the cars will be \$48,000.

DETROIT, MICH.—The contract for constructing the East Detroit and Grosse Pointe Electric Railway has been awarded to Gilbert

M. Moran, who will do the grading, track-laying, and ballasting and deliver the road ready for the wires and rolling stock.

NEWPORT.—Chartered is the Newport and New York Rapid Transit Company to cut a canal across Conanicut Island and establish a steamboat line. Daniel Watson, of Newport, is a leading projector.

BISMARCK.—The contract was let, June 7, to A. E. Beal, Thomas Fortune, and Nathaniel Skelton, of this city, for grading that section of the Aberdeen, Bismarck and North-western Railway extending from Napoleon, Logan County, to Bismarck and the steamboat landing, a distance of fifty-seven miles. The work must begin on or before June 10, and be completed by October 1 next. This company has also filed with the Secretary of the Territory articles of location of line to the coal fields in McLean County. Work between Aberdeen and Napoleon is now over half done, and Engineer Richards says that in thirty days more it will be nearly completed, ready for bridges. It is said the Manitoba will also grade a branch from Minot to Coal Harbor in McLean County this year, with the ultimate intention of continuing the line on to Bismarck and thence to a connection with the south-western extension of the Manitoba system at Ellendale.

BUTTE, MONT. T. is to have an electric and cable street-railroad service.

PALATKA, FLA.—The St. Johns and Halifax Railroad will build a large railroad bridge at Rolleston. Colonel S. B. Carter is engineer.

FLUSHING, L. I.—The franchise for a street railroad will be sold by the Village Trustees on July 11.

SPRINGFIELD, ILL.—The Secretary of State has licensed the Equitable Transportation Company, of Chicago, capital stock \$1,000,000, for constructing an elevated railway from Blue Island to Chicago.

PORTSMOUTH, VA.—It will have a street-railroad. Address Colonel William H. Stewart.

COSHOCOTON, O.—Address J. C. Fisher about the construction of the Coshocoton and Southern Railroad.

PITTSBURG, PA.—It is proposed to build a railroad bridge at Brunot's Island.

ST. PAUL, MINN.—The Milwaukee and St. Paul Railroad will be extended to Lake Minnetonka. R. B. Langdon is contractor.

LAWRENCE, MASS.—The Committee on rebuilding the burned Duck Bridge met June 18. Professor Vose recommended that a five-span structure be built, and that the contract be awarded to either the Rochester, the Niagara, or the South Broadway Bridge Company. The City Engineer was authorized to prepare the necessary plans and submit them next week.

CHATTANOOGA, TENN.—The Chattanooga Southern Railway has applied for a charter for a line within the State. W. Crutchfield, Robert Dougherty, John Y. Wood, and others are incorporators.

BIRMINGHAM, ALA.—The Birmingham, Atlanta, and Air-Line Railroad is being pushed. The president is Douglass Green, of New York City.

MOBILE, ALA.—The Mobile and Dauphin Island Railroad is begun. P. S. Page, of Scranton, Pa., has the contract for earth-work.

NEW YORK CITY.—Governor Hill has signed the bill authorizing the city to construct the Washington Heights Viaduct Bridge, to connect with elevated railroad. The Department of Public Works will direct the work.

BRIDGE.—The Massillon Iron Company, of Massillon, O., has taken the contract for building the new iron bridge over the Huron River at Rawsonville, four miles west of Belleville. The price is \$6,450.

BAKERSFIELD, CAL., will have a street railroad.

ARTHUR KILL BRIDGE.—Contractor Alexander McGaw, of Philadelphia, has been awarded the masonry work for the bridge of the Baltimore and Ohio Railroad Company across the Arthur Kill, Staten Island. The Phoenix Iron Company has secured the iron contract, and it is stated that all preparations have been made to start the construction of the bridge.

SANTA BARBARA, CAL.—John Cross, of Los Angeles, has the contract for building a street railway here.

WILKESBARRE, PA.—The Wilkesbarre and Parsons Railroad Company is just incorporated to build a street railway. H. H. Dorr, A. H. Phillips, P. H. Carpenter, W. W. Lee, A. W. Betterly, and A. C. Robertson are incorporators.

RAILROAD.—A survey of the Palisades is being made for the proposed Palisade Railroad Company. It is intended to have this road begin at the West Shore Railroad terminus at Weehawken, N. J., and follow the Palisades to Nyack. William Walter Phelps, it is said, has a large interest in the new company.

HELENA, MONT.—Incorporated is the Butte and Ruby Valley Railroad Co., to build from Butte to Madison County and Bozeman; incorporators, Henry Elling, W. W. Norris, A. J. Davis, and others.

RAILROAD syndicate has been formed and incorporated under the laws of New Jersey, under the title of the "Pennsylvania and New England Construction Company," to establish a through line under one management, from Slatington, Pa., to Hartford, Conn., and Springfield, Mass., by the purchase and consolidation of such existing roads as can be made use of, and the construction of such new lines as may be necessary.

PORT CHESTER, N. Y.—The Board of Trustees have decided to advertise for proposals to build a surface street railroad from Byram River through the village of Rye to Rye Beach.

PORT BYRON, N. Y.—A new canal feeder will be built by the State here.

THE Columbia, Newberry and Laurens Railroad Company, of South Carolina, is asking for bids on stone piers of a bridge over Broad River.

THE Macon, Geo., Construction Company has awarded the contracts for bridging, trestling and crossings on the line of the South Georgia and Florida Railroad to Baker & Putnam, of Thomasville, Geo.

RAILROAD.—The Framingham, Mass., Street Railroad Company proposes to build a line seven miles long from South Framingham to Saxonville.

RAILROAD.—Address Frank Jones, of Portsmouth, N. H., President of the Worcester, Nashua and Rochester Railroad, in regard to a proposed line of road from Canada to North Stratford.

THE Columbia, Newberry and Laurens Railroad is progressing.

WINNIPEG, MAN.—Proposals for the construction of the Red River Valley Railway have been considered by the local government, and that of Ryan & Haney accepted for the construction from Winnipeg to Pembina, sixty-five miles, for \$750,000.

RAILROAD.—Articles of incorporation of the Minnesota and Southwestern Railway have been filed in the office of the Secretary of State of Minnesota. The road will be constructed on a line from Northern Pacific Junction southeast to the boundary between Minnesota and Wisconsin. The principal place of business to be at Pacific Junction. The incorporators are James M. Paine, Edgar M. Wilson, Horace P. Breed, Frank W. Booth, Minneapolis; Asa Paine, Northern Pacific Junction; Mark Paine and A. M. Miller, Duluth; M. J. Clark, Grand Rapids, Mich.

SALT LAKE CITY.—Incorporated is the Utah Railway Company. James G. Taylor, of Nebraska; James Anderson, H. T. Duke and others, of Utah, incorporators.

RAILROAD.—A syndicate of railroad men has purchased the St. Louis Hotel at Lake Minnetonka, and will build a branch to the hotel from Hopkins Station on the Chicago, Milwaukee, and St. Paul, nine miles distant, the contract for the branch being let to R. B. Langdon, of Minneapolis.

ST. PAUL BELT RAILWAY COMPANY has been incorporated with a capital of \$1,500,000. Incorporators, Edmund Rice, Jr., W. G. Gaston, William Dawson, Jr., John H. Morrison, E. A. Jaggard. Object: to build a road to cross all other roads in St. Paul, with a common centre for distributing freight.

BIG RAPIDS, MICH., will issue bonds to the amount of \$15,000, for an iron bridge over the Muskegon River.

ANNAPOLIS, MD.—The Baltimore and Drum Point Railroad is preparing to build. The President is Augustus Albert.

MONTGOMERY, N. Y., will issue bonds to the amount of \$13,000, for a new iron bridge over the Walkkill River.

DULUTH, MINN.—Address President Hoyt in regard to the construction of the Duluth, Red Wing, and Southern Railroad.

DENVER, COL.—Utah and Pacific Railroad will be extended to Laramie City. Henry Wolcott is chairman of the Board of Directors.

HYON PARK, ILL.—The village clerk advertises for bids for an iron bridge over the Calumet River.

BIDS OPENED.

TORONTO, ONT.—The contract for dredging in the harbor has been let to Messrs. I. & I. Conlan, of Thorold, Ont. The Harbor Commissioners decline to give the price of this or other bids.

KROKUK.—The contract for grading the public highway has been given to C. A. McNaman at 23 cents per yard.

LEAVENWORTH, KAN.—The contract has been let for the building of a hospital building at the Soldier's Home at Leavenworth to James A. McConigle, of that city. The cost of the building will be \$93,000.

CROOKSTON, MINN.—The contract for steam heating and ventilating apparatus for the high school building has been awarded to the Porter Steam-Heating Company, of Minneapolis, at \$2,843.

HAMILTON, O.—The following bids for water-supply from tube-filter wells (3,000,000 gallons in 24 hours) were received by the Board of Water-Works Trustees, June 16: The National Water-Supply Company, Cincinnati, O., the work complete according to plans and specification, for the sum of \$9,000. The above bid was opened and laid over for further action of the board.

FLORENCE, KAN.—Bids for constructing water-works were opened June 16 by the Florence Water-Supply Company, J. W. Nier, Engineer, and awards of contracts were made to the following parties: Deane Steam-Pump Company, Holyoke, Mass., pumping machinery; H. C. Darby, Kansas City, Mo., boilers and stand-pipe; Holy Manufacturing Company, Lockport, N.Y., gates and hydrants; Shickle, Harrison & Howard, St. Louis, cast-iron pipe and special castings. The prices are withheld.

MINNEAPOLIS.—Contracts on the work-house annex have been awarded as follows: For the brick work, F. A. Johnson, at \$16 per 1,000; for the iron work, Herzog Manufacturing Company, \$4,080; for the stonework, O. B. Brown, \$1 50 per footings.

TRENTON, N. J.—The Safe Deposit and Trust Company has awarded a contract to Titus & Conrad for a building at \$10,000, and to Diamond & Co., of Boston, for vaults at \$13,600.

ALBANY, N. Y.—Contracts for constructing School No. 3 have been awarded by the School Board as follows:

Mason-work, Cassidy & Gallagher, \$9,845; carpentry, Alexander Simpson, \$5,749; iron-work, McKinney & Son, \$1,844; roofing, James Ackroyd, \$1,034.20; painting, Hudson & Wallace, \$635; plumbing, Fitzgerald Bros., \$706; heating and ventilation, Smead & Northcote, \$2,005.

NEW YORK CITY.—The Armory Board opened bids June 10 for the construction of the armory of the 22d Regiment, after plans by Mr. George B. Post. They were as follows:

Plumbing-work, John J. Sullivan, \$13,970; John Spence, \$13,797; George Cully, \$13,693; John Kenahan, \$13,000. For carpenter-work there were three bidders—Mahony Bros., \$94,360; Christie & Foster, \$105,700; Maguire & Sloan, \$98,072. For heating and ventilation two bidders—Baker, Smith & Co., \$12,873; Jacob Jamer, \$12,985. There was but one bid each for masonry-work and iron-work; for the former Moran & Armstrong bid \$186,443, and for the latter the Wallis Iron-Works bid \$114,300. Taking the lowest of the estimates the new armory would cost \$419,688. The cost under the bids was excessive, and new advertisements will be issued.

MIDDLETOWN, N. Y.—The Board of Supervisors have received bids as follows, for the extension of the Clerk's office and Surrogate's Court room: Ah-wa-ga Iron Works, Caldwell & Gray, Oswego, \$9,993.23; Caldwell, Wilcox & Company, Newburg, N. Y., \$10,000; Atlantic Iron Works, New York City, \$10,147. The contract was awarded to the Ah-wa-ga Iron Works.

ALLENTOWN, PA.—The Board of Water Commissioners opened proposals June 21, to furnish two 3,000-gallon pumps for the proposed new water-works at the Fountain House property. The bidders were the Holly Manufacturing Company, of Lockport, N. Y.; Knowles Manufacturing Company, of Holyoke, Mass.; Davidson Pump Company, of Brooklyn; Deane Pump Company, of Holyoke, Mass.; Robert Wetherill & Co., of Chester, Penn.; Southwick Foundry and Machine Company, of Philadelphia; Henry R. Worthington, of New York. The prices of bids are withheld.

NEW YORK CITY.—Bids were opened at the Department of Docks on Tuesday, June 21, for building a new wooden pier at the foot of West Thirty-first Street, North River, to be known as Pier New, 61, North River.

Bidders: Joseph Walsh, \$48,000; E. Sanford Ross, \$50,750; James D. Leary, \$52,240; John Gillis, \$56,388.

BROOKLYN.—The Board of Supervisors of Kings County has awarded the contract for the County buildings at St. Johnland to P. J. Carlin at \$890,000, and for electric-lighting, at the same place, to the Edison Electric-Light Company at \$37,000.

GOVERNMENT WORK.

PEORIA, ILL.—Synopsis of bids for materials, tools, and labor for plumbing and gas-fitting for Post-Office and Court House, opened June 17, by the Supervising Architect of the Treasury Department: Forsyth & Clark, Peoria, Ill., cast-iron pipe and fittings, \$3,935.85; wrought-iron pipe and fittings, \$3,869.45; J. F. Dalton, Boston, Mass., \$4,650 and \$4,800. John M. Simpson, Peoria, Ill., cast-iron pipe, \$5,607.72.

Kinsley & Mahler & Co., cast-iron pipe, \$4,550. John O'Neal & Sons, Peoria, Ill., cast-iron pipe, \$3,554; wrought-iron pipe, \$3,695.

Crook, Horner & Co., Baltimore Md., cast-iron pipe, \$3,700.

SYNOPSIS of bids for columns for 2d, 3d, and 4th stories, and beams for 3d, 4th, and 5th floors of the Court-House and Post-Office, at Louisville, Ky., opened June 22 by the Supervising Architect:

The Marshall Foundry and Construction Co., Pittsburg, Pa., \$32,184; Sneed & Co. Iron-works, Louisville, Ky., \$35,500; M. A. Sweeney & Bro., Jeffersonville, Ind., \$41,938.54; Pennsylvania Construction Co., Pittsburg, Pa., \$36,875; Haugh, Ketcham & Co. Iron-Works, Indianapolis, Ind., \$37,956.53.

SYNOPSIS of bids for iron-work of 3d and 4th floors of the Court-House, etc., Des Moines, Iowa, opened June 17 by the Supervising Architect of the Treasury Department:

Marshall Foundry and Construction Co., Pittsburg, Pa., \$6,447; Benton Foundry Co., Chicago, \$6,000; Dearborn Foundry Co., Chicago, \$6,280; Clark, Raffin & Co., Chicago, \$6,569; Haugh, Ketcham & Co., Indianapolis, Ind., \$6,687.65.

SYNOPSIS of bids for rebuilding the Revenue Steamer "McLane," now lying at Baltimore, Md., opened by Secretary of the Treasury:

H. A. Ramsay and Son, of Baltimore, Md., \$32,936. Charles Reeder and Son, Baltimore, Md., \$32,445. The Pusey and Jones Company, Wilmington, Del., \$54,000.

Columbian Iron Works, Baltimore, Md., \$60,000. J. Bigler, Newburg, N. Y., \$35,083.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1886, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 5. } PUBLISHED EVERY SATURDAY.

NEW YORK, JULY 2, 1887.

LONDON, JULY 16, 1887.

SINGLE COPIES, TEN CENTS.
Subscription, \$4.00 per year in advance, post paid. } IN AMERICA
SINGLE COPIES, SIXPENCE.
Subscription, 20s. per annum in advance, post paid. } IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 94 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed — & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 20, Leipzig, Germany, and ASHER & CO., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

THE POUGHKEEPSIE BRIDGE BILL.

GOVERNOR HILL, of New York, has signed the act passed by the State Legislature regarding the Poughkeepsie bridge.

After a patient hearing of the opponents of this bill, the Governor arrived at the only just conclusion possible—viz., that it would be an abuse of power to veto it.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD has favored the building of the bridge, and is glad to see that, apparently, no impediment now remains to its completion.

Within reasonable limits, the widest possible freedom should be given to the development of commerce in every direction. There is undoubtedly a natural jealousy on the part of those navigating the Hudson River against the placing of the slightest impediment in its channel. When piers or other structures are liable to cause a dangerous contraction of the navigable channel in the river, it would be an abuse of power to authorize their construction. The Legislature must, however, look at all sides of such a question, and when it is considered that for 150 miles the Hudson River has always been a barrier to land communication, it is manifest that the building of a bridge should not be prohibited or interfered with except upon the most positive proof of danger to the interests of navigation.

To all who have studied the problem, the claims that piers at 500 feet distance from each other in a stream like this can be so dangerous as to cause the diversion of the freight to other routes is preposterous. That there is a great increase in the liability to accident is also untrue.

We are strong advocates of the untrammelled use of our waterways, and of the development of many now unused. At the same time we uphold all proper development of our railroad system. Both are necessary, and legislative aid should only be invoked to prevent abuse and not to hamper either in its rightful progress.

YELLOW FEVER AT KEY WEST.

THE outbreak of yellow fever at Key West has produced the usual conflicting reports. On the one hand the Government medical officials say that it has established a foot-hold, and that the place is dangerous to all who have not had the fever, and this is probably the truth. On the other hand, we have telegrams and reported interviews with inhabitants of Key West to the effect that the fever has been stamped out; that there has probably not been any yellow fever; that there is an unfounded scare gotten up to injure business; that the place never was healthier, etc. But Key West is a good place to keep away from just now, all the same, and it is a source of grave danger to the South Atlantic and Gulf Coast, the ports of which can hardly take too stringent precautions against the spread of infection from it.

REPORT ON DISPOSAL OF THE SEWAGE OF THE CITY OF WORCESTER.

THE report by Mr. Charles A. Allen, City Engineer of Worcester, contains a concise description of the methods used for the treatment and purification of sewage at the Croyden, Doncaster, and Wigan sewage-farms, the Paris, Berlin, and Dantzic irrigation, and at the Burnley, Bradford, Lee, and other precipitation-works, and data as to the quantity and com-

Worcester. His report of a visit to the Pullman sewage-farm coincides with what we learned on the occasion of a visit in May, 1886, which was editorially referred to in our issue of June 17, 1886. He says:

"The farm is run for the purpose of making money, the purification of the sewage being a secondary consideration."

"During the summer months, when vegetation has received all the sewage it will bear, it is simply turned into Lake Calumet in its crude state."

Mr. Allen recommends the adoption of a chemical precipitation method for dealing with the Worcester sewage, and gives the following reasons:

"First—That the effluent obtained will, without doubt, conform to the requirements of the law.

"Second—That the cost of establishing a plant will be less than by either irrigation or downward intermittent filtration.

"Third—That chemical precipitation will not be affected by climatic conditions.

"Fourth—There will be no loss of water, and, consequently, no damages to pay.

"Fifth—If this method be adopted the city will be in a position to take advantage, without material change in plant, of improvements that will undoubtedly be made in the methods of sewage disposal.

"Sixth—That precipitation will be a valuable auxiliary to irrigation or intermittent filtration, if it should ever be thought desirable to add either of these methods of disposal to the system."

The analyses made indicate that the sewage of Worcester is acid, and that it contains a large amount of soluble sulphate and salts of iron, these characteristics being due to the large amount of factory wastes. The chemical process proposed is the addition of milk of lime, which, it is thought, will, in connection with the iron salts already in the sewage, give a satisfactory effluent.

Mr. Allen lays considerable stress on loss of water to the stream as an objection to any plan of disposing of the sewage by irrigation, on the ground that claims for damages will be made against the city by owners of mills lower down the stream if the stream is diminished.

The estimated cost for the construction of intercepting and outfall sewers, and for land, tanks, and machinery, is \$322,758.75. The daily amount of sewage to be treated is estimated at 3,000,000 gallons, or an average of 60 gallons per head per day for 50,000 persons, and the annual cost of the chemical treatment is put at \$22,500.

Whether one agrees with Mr. Allen's conclusions or not, his report is an interesting one, and brings out clearly the necessity of considering local conditions in advising as to a system of sewage disposal.

THE CONVENTION SEASON.

THIS is the time of year when the numerous associations of technical and scientific men meet in some pleasant resort to exchange experiences, make acquaintances, and have a good time generally.

The social part of these meetings is generally admirably managed, and the excursions, reunions, banquets, and receptions furnish to the members that "change of labor" which is looked upon as "rest," and is really of incalculable benefit to men who, during the rest of the year, are generally a hard-working and hard-worked class.

The excuse which our practical tendencies make it necessary to offer for any relaxation from the everlasting daily grind of business is in this case put forth as the advantage and benefit to be derived from an interchange of views and experience on subjects of common interest in the business which occupies the attention of the members of each association. If such interchange of experiences did actually take place, the benefit which is claimed for it would doubtless follow; but the complaint which most of those make who cannot attend the meetings, but rely upon the published reports, is that the objects of the meeting do not appear to be carried out in spirit or in fact. And there is a great deal of truth and force in this complaint. Papers are read, to be sure, and speeches are made, but the mass of verbiage contains very few nuggets of fact which are worth digging for in the voluminous reports. The cause of this is to be found in the diffidence of members who are more accustomed to think and act than to write or talk in public. Such men are very

variety of problems concerning the disposal of sewage, or other problems coming before the city and water-works engineer; or, in general, in those branches of the profession which do not appear to have among their practitioners as many men who are ready to tell what they know as some that are in other branches. Above all, managers of such meetings should remember that figures and statistics as such are meaningless and unprofitable, and the reading of them in public an intolerable bore.

OUR BRITISH CORRESPONDENCE.

Sea Water for Street Sprinkling—Competitive Plans for Municipal Works in Oldham—Registration of Plumbers—Extreme Heat.

LONDON, June 15, 1887.

THE evidence given before the Local Government Board inquiry in the matter of sea-water for street-sprinkling and

In the first place, there is the old story of miserable premiums, to which architects are beginning to get used by this time. They, however, ask the competitors to state what commission they would charge if engaged to supervise the work. Competition is truly the order of the day with them.

The registration of plumbers in Great Britain does not progress as favorably as it should do. At the fourth meeting of the General Council, it was stated that 495 journey-men plumbers was the total number registered up to the present time, exclusive of master plumbers, and that the total cost had been £2,017 (\$9,681.60). There is, of course, an offset in the sum of £850 (\$4,080) received as fees. Mr. George Shaw stated that in the course of examinations, which were purposely made as easy as possible, it was discovered that applicants were continually unable to pass the most simple test. In one case 50 per cent. only had passed.

The sudden spell of heat, the maximum reached being 139.9° Fah., has had the effect of expanding a portion of the railway metals in Lancashire on the London and

A COTTAGE AT ROCKAWAY, L. I.

apt to labor under the delusion that a paper ought to be exhaustive in its treatment of its subject, and elegantly written, and that they have not the time nor the literary ability to produce anything worthy of presentation to their associates.

This is a very mistaken idea, and the sooner it is gotten rid of the better will it be for the societies and their members. It very often occurs that a very short statement of actual practice in any work of construction, clad in the simplest language, will elicit from its hearers a far greater fund of interesting and important information, and of reasons for certain methods of practice, than any elaborate dissertation could possibly do.

We commend this thought to the Convention of the American Society of Civil Engineers now in session at the Hotel Kaaterskill. These conventions are usually productive of much interesting discussion, and we trust that some member of this one will open up a lively interchange of views on some subject which is new or has not yet been worn out. For example, the great

flushing purposes will be of interest to borough engineers. The inquiry was in connection with the scheme of the Commissioners of Bournemouth for laying down pipes for filling water-carts, etc. It was stated that the cost of the water would only be about 5d. (10 cents) per thousand gallons for a period of 30 years, after which time the loan would have been discharged, and the cost would then be only 3d. (6 cents). Mr. Percy Boulnois, the Borough Engineer of Portsmouth, stated that salt water was particularly adapted for purposes of street-sprinkling, especially for gravel, as the salt skinned on the road, and that under ordinary conditions the effects of one sprinkling of salt-water a day were equal to two sprinklings with fresh water. The Borough Engineer of Great Yarmouth, Mr. J. W. Cockerell, confirmed the statement as to the skinning, and upheld the utility of salt water for flushing the sewers. The scheme for Bournemouth is under the charge of the Surveyor, Mr. G. R. Andrews, and the plant will be two 9-horse-power gas-engines, about 12,000 yards of 6-inch and 11,500 yards of 4-inch main, with 57 standards and 57 hydrants.

The Borough of Oldham, in asking for plans in a competition for certain municipal works, is striking out a new line, which will certainly not be appreciated by architects.

North-western system, between Huyton and Prescott, to such an extent that the rails became contorted and a partial block of the traffic ensued. This is notwithstanding the fact that an allowance is made in laying down the lines for a small longitudinal expansion.

SAFETY-VALVE.

OUR SPECIAL ILLUSTRATION.

THE subject of our special illustration this week is the house for the Metropolitan Club, situated on the corner of H and Seventeenth Streets, N. W., Washington, D. C. The building is constructed of brick and stone, with a hardwood finish. The cost of the building was \$35,000. The architects were Messrs. W. B. Gray and H. L. Page.

OUR VIGNETTE ILLUSTRATION.

A COTTAGE AT ROCKAWAY, L. I.

THE subject of our vignette illustration is a cottage at Rockaway, L. I. The architect's name is not known to us.

GRAY & PAGE, ARCHITECTS.

BUILDERS' AND CONTRACTORS' ENGINEERING AND PLANT.

No. XIX.

(Continued from page 12.)

THE use of narrow-gauge portable track as an adjunct to a contractor's plant is rapidly extending, especially as contractors learn the great saving in time and money accompanying its use, and the increased facilities it affords for doing work.

In all parts of Europe, on small as well as large jobs, will be found what is called the "Decauville," from the name of the originator and maker. This is a narrow-gauge, portable track fitted with different kinds of wagons, according to the material to be handled. The track is all steel, made up in sections 16 feet long, with shorter pieces 4 to 8 feet to join with curves, etc. The rails are made of different weights according to use, such as 3, 4½, 6 and 8 pounds per linear foot. They are connected by steel sleepers riveted to the rails; 6 sleepers to each length.

gives more stability. These are the sleepers shown in Fig. 65; for ordinary work they are made flat. The gauges used are 16, 20, 24 and 30 inches, but for ordinary jobs of earth-work or building the first two are the most popular. Some 50 miles of 20-inch gauge are in use on the Panama Canal work. For ordinary building operations 1 to 500 feet are often employed for bringing mortar or materials to different parts of the building. The sections weigh from 116 to 300 pounds according to the gauge. The smaller gauge sections can be carried by a single man and the wider gauge by two men.

Curved sections and switches are all prepared ready to lay, as also iron turntables weighing only 200 pounds.

The wagons used consist of a truck made of iron, with four cast-iron or steel wheels, and the body varies according to the material to be handled. For ordinary contract work the form is that shown in Fig. 66. It is of sheet-iron supported on two trunnions at each end, which allow of its being tipped on either side by a slight effort, though it will remain in place even on a rough road. For light work these wagons will hold from 9 to 11 cubic feet. If horse-power is used for propelling the wagons, their capacity is increased to 14 cubic feet. For use in trains with locomotives the wagons are made to hold from 18 to 27 cubic feet. The same shaped body is also made with a grating in the bottom for transporting ballast for concrete, thus allowing it to be washed. Bodies are also made with a hook at each end by which to hoist them. When large stone are to be moved platform cars are used.

tionality, and it would be hard to say where it was first used. A few years ago a track known as the Peteler track was widely used in this country, but seems to have dropped out of the market. Our contractors seem now, however, to prefer buying light rails and suitable car fittings, and making track and cars to suit their own ideas.

We hope to describe some of the special plant that has been adopted in future numbers of these articles.

(To be continued.)

PORTLAND CEMENT—TESTS AT LONG DATES.

THE accompanying data, derived from the breaking of some 200 briquettes at dates varying from the original seven days' test to 410 days, and from that to 2019 days after gauging, are offered very tentatively, especially as regards the deductions drawn from them, but may not be altogether without interest.

The initial strength of the briquettes broken—that is to say, the strength at seven days after gauging—is by no means high; nor are the final results at any date such as are often secured, the minimum and maximum at seven days being 240 lbs. and 563 lbs. respectively, the greatest test obtained at any date being 700 lbs. per square inch of section; but this may be explained by the fact that the cement was not made to meet any high specification, the grinding was such as to leave a residue of 20 per cent., on a sieve of fifty meshes to the inch, and the gauging was done purposely so as to arrive at the minimum rather than the maximum result; and the same cement in other hands has always given tests from 20 per cent. to 25 per cent. or thereabouts, higher than those from which this statement is deduced. But though it is desirable that these facts should be understood, the comparative lowness of the tests in no way interferes with the general inferences which may be drawn, except that it may be considered that the limit of strength at seven days which gives the best final results may be raised somewhat when cement is tested so as to give out its greatest strength; and perhaps, instead of this figure being in accordance with these results, 538 lbs. per square inch of section at seven days after gauging, it may be increased to 650 lbs. or 670 lbs. for finely ground cement. But with this initial strength there is, in these examples, little if any increase in cohesion; indeed, in many cases, there is a falling off in this respect—which is, however, compensated for by increased strength in some cases. In eleven samples whose initial strength was between 500 lbs. and 600 lbs., six showed a loss of strength amounting on the average to 79 lbs. per sample, or 15 per cent.; while five showed an increase averaging 85 lbs. per sample, or 16 per cent.; or, taking all the samples into consideration, a loss of 1 per cent.

It will be noticed that cement with an initial strength of only 350 lbs. gives equally good results at 1076 days after gauging with that having an initial strength of 535 lbs. broken 686 days after gauging; and it is not probable that the increase of strength of any cement would be greater during the third and fourth year after it was made and used. All the samples of a less initial strength than 300 lbs. while showing an equal percentage of increase of strength, do not give anything like so good a final result; while above 350 lbs. initial strength the percentage of increase falls off rapidly, so rapidly that the final result is not so good as that having a lower initial strength. These tests seem to point to the use of one or two qualities of cement—namely, either that giving the maximum percentage of increase in strength, or that showing no increase at all in say three years in each case—the two qualities of cement being represented in the above samples; the first by that having an average initial strength of 330 lbs. per square inch at seven days, and the second by a cement having an initial strength of 535 lbs. at the same date after gauging. It is a nice question which to prefer, and the user must be largely guided in his decision by the purpose for which the cement is to be employed, whether the material can wait for the added strength to accrue. If this be the case, there seems to be little doubt that the cement having a comparatively low initial strength with a large percentage of increase should be preferred, for such a cement is decidedly more reliable, and there is no fear of its containing an excess of lime. The figures in brackets are those which may be considered to represent the full strength of the cement if tested in the most advantageous way, and are found by adding 22½ per cent. to the original figures.

Initial strength.	Average strength at seven days after gauging.	Average date at which samples in following column were broken.	Average strength.	Absolute increase or decrease in strength.	Average increase or decrease in strength per cent.	Average increase or decrease in strength per cent. per annum.

—REGINALD EMPSON MIDDLETON, M. Inst. C. E., in the *Engineer*, London.

FIG. 65

FIG. 66

Each rail has a pair of fish-plates riveted to one end and a steel shoe riveted to the bottom at the other end (see Fig. 65). In this way the different lengths may be laid together, and in many cases need not be made fast, being so much the more easily taken apart and relaid. When steam-power is to be used the sections must be bolted together. If the track is to be used permanently in one place for some time a special trough-shaped sleeper has been designed which projects 4 to 6 inches beyond the track and

Fig. 67 EXCAVATING APPARATUS —USED ON THE— TANCARVILLE CANAL AND SEWER

On the work of the Tancarville Canal and Sewer at Havre, France, there was an iron syphon laid below the bed of the proposed canal. It was for sewer purposes and formed of two sheet-iron pipes, 4 feet in diameter, laid in concrete. The canal itself was excavated by a steam-excavator, then a 5-foot trench was dug for the sewer. A pair of movable trestles were erected over the trench (Fig. 67) set to run on a track parallel to the trench and connecting with the bank on one side. The "Decauville" was laid on these platforms over to the bank and thence to the waste-dump. There were two tracks on each platform and trap-floors through which the dump-boxes could be raised or lowered, and a steam windlass for this purpose. A boiler on the bank furnished steam for both windlasses by means of flexible hose. In the more recent wars in Egypt, Afghanistan, Tonkin, etc., this plant has been extensively used for transporting troops and provisions; also in the African exploring expeditions the "Decauville," with platform-cars, was used for transporting steam-launches, baggage, etc. Last year Mr. de Brazza exhibited some of the features of his African expedition to the Congo, in the Hippodrome in Paris. There were 103 consecutive performances, in one part of which a "Decauville" is introduced. Some 500 feet of 20-inch gauge was laid each day by 20 sailors and then a train of 3 passenger-cars and a 2½-ton locomotive run over it with no accidents. This plant is rendering a great service to small contractors all over Europe and also in South America.

The use of portable track is not restricted to any na-

THE HASTINGS, ST. LEONARD'S, AND EAST SUSSEX HOSPITAL PLANS.

We are indebted to the *Builder* (London), from whose columns we have reproduced the plans of this hospital and obtained the following data. The architects were Messrs. Young & Hall.

Two schemes were submitted for the approval of the committee—one having wards of the usual form, the other having wards of a circular form, a system which owes its origin to the eminent surgeon, Professor John Marshall, F. R. S.

Several members of the committee and of the medical staff having visited the Miller Memorial Hospital at Greenwich, which (the first hospital with circular wards erected in this country) had recently been completed from the

them, and these lead to a broad balcony so arranged that the patients can be wheeled out into it in their beds. The mortuary and postmortem rooms are on the ground floor and isolated.

THE ARCHITECTURE OF LONDON STREETS.

The *Journal of the Society of Arts*, London, prints a paper read in the Art Section on May 10, by Edward J. Tarver, F. S. A., on the subject, "The Architecture of London Streets," from which we quote the following:

"In England, and especially in our large towns, where every one is free to erect buildings of whatever size he likes, so long as they are carried out in conformity with certain Acts of Parliament as to structural and sanitary conditions, it is hardly possible that each should know

"In the case of new thoroughfares, this would be easy enough, but I would extend this fount of information, as far as possible, to entire towns. The first duty of the officer in charge of this system should be to make himself thoroughly acquainted with his town, not only from maps, but by personal inspection of every portion—no light duty to begin with. I think I see him, mounted on a steady horse, wearing a coat with several outside pockets, containing his maps, note-books, and a sextant. Armed with these, he takes his town methodically in districts, and passes up and down every street. Of course he will pay most attention to the main thoroughfares, as they affect the pleasure of the greatest number of wayfarers in their daily route to and from their business. And I may say here in passing, that the new omnibuses, with their roof seats facing forwards, afford the most enjoyable way of contemplating our street architecture. A Hansom cab may or may not be a quicker conveyance in our crowded thoroughfares, but the view from one is nothing as compared with that from the top of an omnibus.

"To return, however, to the public officer. He will not neglect the smaller streets, for many of our most picturesque views are obtained in them, and besides, no one knows whether or not they may be removed or widened to make way for broader thoroughfares, which would throw into conspicuous prominence some hitherto concealed buildings. Where any important buildings exist, our officer will take a rough sketch of them in his book, or secure a photograph, and if he should know that there is any prospect of altering or widening the street, he will consider the most favorable point of view from which such buildings may be seen. A rectangular building, for instance, generally looks better at an angle than as seen straight in front of the spectator.

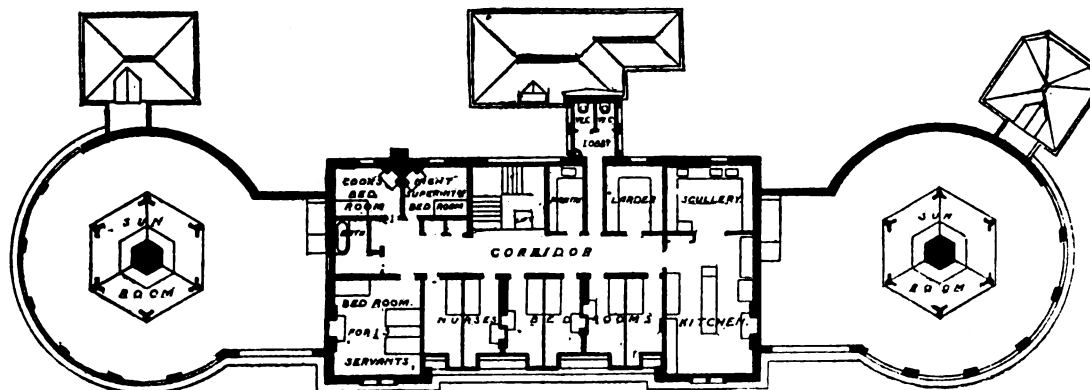

"But the more important buildings have to be considered, not only as seen from their immediate neighborhood, but as forming conspicuous objects from a distance. Here the sextant will be found useful, and the approximate height of every building that rises above the neighboring rooftops will be marked by our officer upon the Ordnance map which he carries about with him. The bench-marks already figured on the map will supply the remaining information as to the altitude of the spot above Trinity datum level. The effect of a distant building depends very much upon the intermediate levels of the ground beyond which it is viewed.

"In order to record the heights of important buildings in an easily comprehended manner, they will be marked in various colors upon a map already shaded in Indian ink, to denote the contours of the ground levels. For instance, all buildings over 200 feet high will be colored bright red; all over 150, purple; over 100, yellow; over 70, green; over 50, blue. These heights, added to the contour levels, will enable any one to see at a glance the part that such buildings take in the general landscape, and an architect about to build a tower will know whether 150 feet will be lost in a valley, or prove a mere waste of his client's money on a hill.

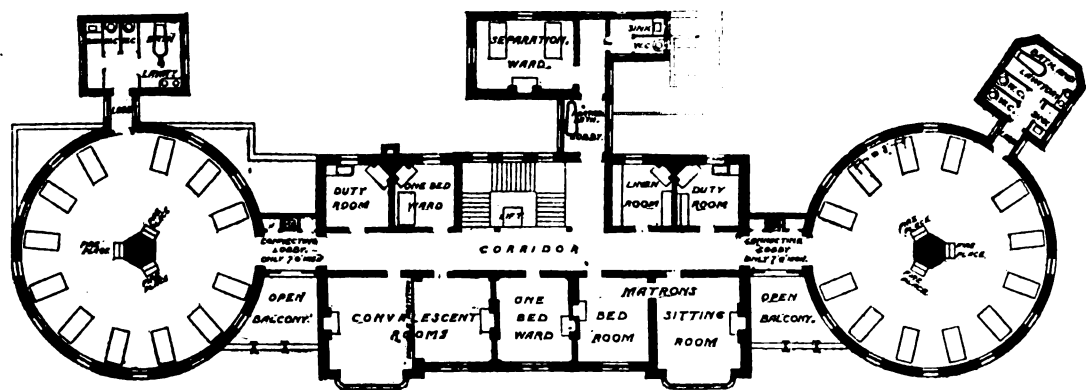

"As far as possible, it would be useful to have elevations of entire streets set up to a small scale; but the enormous size of some of our towns renders such vast labor out of the question. Fortunately, modern science comes to our aid in the shape of photography, and there are many streets which can now be recorded by the camera without very much distortion through a wide-angled lens.

"In order to obtain an idea of the actual appearance of the thoroughfare, the architect of any proposed building will naturally go and see it for himself; but supposing the land is eagerly taken up, and a hundred architects are all busy at work in their respective offices designing buildings of various sizes to be built on this thoroughfare, who can say whether the street, when finished, will make or mar the beauty of the town? It is here that I venture to submit that our public officer will be of real use.

"Let each architect, so soon as he has formed a general outline of a building that will suit his client's wants, send his design by a messenger to our officer. He will have one or two rapid draughtsmen, who will reduce to the required scale the elevation and the roof plan. The latter is most important, as showing the position of the chimneys, which affects street architecture more than may be generally supposed. The messenger will take back the plan in half an hour, so that the architect will not suffer from that most inconvenient state of being without his plans, which he is sure to want, if they are out of his reach for even a day."

THIRD FLOOR PLAN

PLAN OF FIRST AND SECOND FLOORS

WHITE ROCK ROAD.

THE PARADE.
GROUND FLOOR PLAN.

design of Messrs. Young & Hall, the circular system was, after much discussion, finally adopted, and the designs from which the present hospital is being erected were definitely approved.

The building is planned to accommodate sixty-eight patients in five circular wards of twelve patients each, four wards of one bed each, and two separation wards of two beds each.

The central portion contains the general administration offices, with rooms for the resident medical officer, matron, nurses, and servants. The kitchen is placed on the top floor, and will be fitted with a complete gas-cooking apparatus by Messrs. James Slater & Co.

The wards are connected to the administrative department by means of corridors which are only eight feet high, so constructed as to allow a free current of air to pass over

what his neighbors are doing, still less possible that he should know what his neighbors are likely to do in the future. Nor would Englishmen submit to be bound down to build to one rigid line. Our liberty is too glorious a thing, when not abused, to be given up to a second Baron Haussmann.

"And yet, it appears to me, that it is possible to establish a system by means of which the individual architects of our new buildings should be enabled to work together for the common good, and for the prevention of clashing discords in our street architecture.

"As I said before, it is impossible for each man to know what his neighbors are doing; therefore, it should be the business of one public officer to collect all the plans that arise from time to time, and to record them in documents which should be accessible to all.

AMERICAN WATER-WORKS ASSOCIATION.

THE American Water-Works Association will hold its seventh annual meeting at Minneapolis, Minnesota, Wednesday, Thursday and Friday, July 13, 14 and 15, 1887.

It is hoped that City Councils and Boards of Directors will show their appreciation by having representatives in the association, and by sending items of information.

The approaching convention promises to be one of unusual interest and attendance.

The following is the programme:

Wednesday, July 13—Morning session, 10 o'clock. Opening addresses. Regular order of business. Afternoon session, 2:30 o'clock. Reading of papers: Ground water as a source of supply, A. C. Sekell; Water for public supplies, Colonel William Ludlow; Private water companies, H. F. Dunham; Revolution counters, Frank H. Pond; Recording gauges, Charles A. Hague. Evening session, 8 o'clock. Reports of special committees. Question box. Volunteered papers.

Thursday, July 14—Morning session, 10 o'clock. Reading of papers: Natural filtration, G. W. Pearsons; Legal relations, Consumers vs. Suppliers, A. A. Godard; Is water property? A. H. Denman; Reservoirs, open or closed? G. E. Beach. Afternoon session, 2:30 o'clock. Reading of papers: Filtration or subsidence, J. D. Cook; Local distribution of water, P. Milne, Jr.; Fungus or mossy growth, S. McElroy; Elevator indicators, J. N. Tubbs.

Friday, July 15—Morning session, 10 o'clock. Regular order of business. Adjournment.

The committee, with the citizens, have arranged excursions to various points of interest both in Minneapolis and St. Paul, as well as a trip to the lakes, and other social features.

The officers of the association are as follows:

President, B. F. Jones, Kansas City, Mo.; Vice-Presidents, W. L. Cameron, Memphis, Tenn.; H. G. Holden, Lowell, Mass.; J. M. Diven, Elmira, N. Y.; W. J. Milner, Birmingham, Ala.; Richard Holme, Denver, Colo.; Secretary and Treasurer, J. H. Decker, Hannibal, Mo.; Past President, Peter Milne, Jr., New York, N. Y.

Committee of Arrangements and Reception—Colonel John W. Henion, Chairman, Minneapolis, Minn.; Andrew Rinker, City Engineer, Minneapolis, Minn.; Colonel J. T. Fanning, Minneapolis, Minn.; L. W. Rundlett, City Engineer, St. Paul, Minn.; H. H. Harrison, Superintendent Water Works, Stillwater, Minn.

MINNESOTA ENGINEERS' CLUB.

THE club met in Minneapolis June 24. The secretary read the obituary prepared by the committee relative to the death of Franklin Cook. The secretary read an invitation to the convention of the American Society of Civil Engineers, and the club appointed President George W. Sublette a delegate. The president stated that one object of this meeting was to consider the feasibility of having an excursion. On motion of G. S. Houston a joint committee was appointed to assist the secretary in finding the wishes of the members regarding the proposed excursion and also those of the St. Paul club. The president appointed on the joint committee Messrs. W. W. and C. S. Redfield, and on the second Messrs. Houston and Cappel. On motion the president appointed Messrs. Cappel, Pike, Houston, Redfield and Pardee a standing committee on tests of materials, to confer with the State University authorities with reference to a series of tests of local materials to be conducted with a view of correcting the tables on strength of materials.

CALL FOR CANAL CONVENTION.

THE third annual convention for the purpose of considering measures for the improvement of the canals of the State of New York will be held in the Common Council Chamber in the city of Rochester, N. Y., on Thursday, the 28th day of July, 1887, at 11 o'clock A. M. All organizations of citizens in this State representing the commercial, manufacturing, agricultural, labor, and other interests, also individuals and public officials who favor the improvement of the State canals, are invited to send delegates. All individuals and delegates who expect to be present are requested to forward their names and addresses to Frank S. Gardner, Secretary, 55 Liberty Street, New York, as early as possible. The headquarters of the Executive Committee during the convention will be at Powers' Hotel.

THE State of New Jersey has obtained an injunction against the continuance of the work of building a bridge over Arthur Kill, or Kill von Kull.

SANDUSKY HARBOR.

FROM a report on this harbor made by Major L. Cooper Overman, of the U. S. Engineers, we have prepared the following statement:

The entrance to Sandusky Bay is about 40 miles from the western end of Lake Erie, and the Bay forms a natural harbor covering about 22½ square miles, with a depth of from 8 to 12 feet. The Sandusky River enters it at the south-west, some 14½ miles from Cedar Point. The present channel has been improved somewhat under previous appropriations, but it is crooked so as to require three sets of range beacons for its navigation and is 4½ miles long to deep water in the lake. It was intended to have 15 feet depth as being sufficient for the vessels navigating the lakes a few years ago.

The commerce of the city has since then greatly increased, as well as the size of the vessels; and it is now proposed to cut a channel which shall be shorter, straighter, and deeper, the width at bottom to be 200 feet and depth 17 feet.

Twenty-five thousand soundings were taken by Mr. Colby, the Assistant Engineer, and 75 borings made, all through the ice, showing an average cut of only 4½ feet and a favorable bottom throughout, and a saving of distance of 40 per cent. over the old scheme. The cost is estimated at 14 cents per cubic yard, or a total, including contingencies, of \$96,712. A consideration of the currents seems to indicate that the present eastern current will assist in keeping the channel clear, and the annual expense is placed at but \$5,000.

The revenue for 1886 was \$4,269; imports, \$40,231, and exports, \$222,058, with a rapidly increasing traffic.

In connection with the subject of harbors on the lakes, we are pleased to notice the transmission to the House of a resolution by the Lake Carriers' Association endorsing the project of a purchase by the United States of the Sturgeon Bay and Lake Michigan Ship Canal, so that it may be "a free passageway and harbor of refuge."

The whole country is interested in the proper development and protection of all forms of water transportation, and within reasonable limits, expenditures for this purpose by the general Government are wise and to be commended.

TRAINING SCHOOL FOR NURSES.

A TRAINING school for male nurses has been established at Charity Hospital, Blackwell's Island, under the direction of the Commissioners of Public Charities and Correction of New York, and a circular of information for applicants has been issued.

Those wishing to receive a course of instruction in this training school must apply to the Managers of the Male Training School of Charity Hospital, upon whose approval they will appear before the Board of Commissioners, and, if satisfactory to them, will be accepted as pupils in the hospital. The applicants must be between twenty and thirty years of age and must produce evidence of good moral character, be sober, and will be required to pass an oral, written, and physical examination. They will be under the authority of the Board of Commissioners of Public Charities and Correction. The Managers will have the power to decide as to the fitness of the orderlies for the work, and the propriety of retaining or dismissing them.

The term of service will be two years, during which time the orderly will reside constantly in the hospital, and will perform the duties of orderly in the various wards to which he may be assigned. He will receive \$12 per month during the first year, and \$15 per month during the second year, together with board and washing for the entire period of service.

At the expiration of the full term of two years orderlies will, after a final examination, receive diplomas certifying to their knowledge of nursing, their ability and good character, signed by the Commissioners of Public Charities and Correction, the President and Secretary of the Medical Board, and the Managers of the Male Training School.

Such an institution is needed, and those who hold such diplomas will not lack employment.

THE Contractors' and Builders' Board of Trade, of St. Paul, Minn., has elected officers for the ensuing year as follows:

President, Edward E. Scribner; First Vice-President, G. J. Grant; Second Vice-President, M. Breen; Third Vice-President, C. Lauer. These officers constitute the Board. J. H. Hanson was re-elected Secretary.

SWILL-MILK.

Science for June 10 publishes a letter on the subject of "swill-milk" from Prof. W. H. Brewer, of the Sheffield Scientific School, New Haven, Conn., as follows:

"By way of explanation, I may say, that, aside from my profession, I have been a member of our city board of health for about fifteen years, and its president some years, so have given the matter some thought; although there is no distillery here, and, so far as I know, no distillery milk sold in this city.

"I wish to add to the notes in this circular, that I have a decided opinion that swill-milk is unwholesome; but this opinion is founded on general facts rather than on specific proof.

"The following are among the facts inducing this belief:

"1°. That the health of cows affects the wholesomeness of their milk is proven beyond any doubt; and the health of cows fed largely or wholly on distillery swill is poor, as is abundantly shown by their general condition and by their high mortality.

"2°. It is well enough known that the food of cows affects their milk, and that their chief food largely determines its character. No one claims that distillery swill is the normal food of cows, or is wholesome food when fed in relatively large quantities. Odors of food (as of onions, etc.) show that some of the chemical compounds of the food go into the milk unchanged; and the same is shown by abundant experiment on animals. The experience with drugs (particularly the alkaloids, as morphine) with women in lactation is in the same direction, and is familiar to all medical men.

"3°. When swill-milk is undergoing spontaneous decomposition, it behaves differently from normal milk; it is usually acid when drawn, while normal milk is alkaline; it behaves differently in the processes for the manufacture of butter and cheese (and therefore probably also under the digestive processes)—so differently that creameries and cheese-factories refuse it. This is universal so far as I know any thing about them. I have heard this matter discussed by butter and cheese makers, and, so far as the general facts are concerned, I think there is no difference of opinion, that, where distillery swill forms a large or chief part of the food of the cows, milk is much injured for butter and cheese; the only difference of opinion being as to whether or not some may be used along with other food without injuring the milk.

"4°. We have abundant and sad proof that milk readily absorbs infections, and numerous epidemics of disease have been traced to this source. It also absorbs odors, and swill-milk stables are proverbially foul and stinking; so this doubtless adds to the possibilities of unwholesomeness.

"5°. These, with other facts taken in their connection, with the scattered and more or less vague data as to sickness in specified cases following the use of swill-milk, where this seems the factor most open to suspicion—altogether make me believe that, as compared with other milk, swill-milk is unwholesome.

"6°. I have never found any facts pointing in the opposite direction. Some are negative, others point in this direction. I know of none that point positively in the opposite.

"7°. The use of distillery waste for feeding cows has been more carefully and scientifically investigated in Germany (as I understand it), with the conclusion that it may be used in limited quantities, along with other food which forms the chief part of the ration, without injuring notably the milk. As I understand it, I may compare it with the use of turnips, cabbage, etc., which make the milk 'taste,' if fed in large quantities or at indiscriminate times, but which may be fed in limited quantities, and at certain times in respect to the milking, without flavoring the milk at all. I have often heard this matter discussed among farmers and milkmen, and, similarly, I think it very probable that some distillery swill may be used, regulated as to the quantity, the time of feeding, and the other food which goes with it, without practically injuring the milk. But because of the difficulties of supervising the production of milk for cities, and of controlling its sale, I would forbid, under heavy penalties, the sale of all milk in cities and towns, produced by swill-fed cows, whether much or little swill was used.

"I have made many inquiries among physicians on this matter, and I think the vast majority believe that swill-milk is not wholesome for children, and that this unwholesomeness is not merely negative, arising from its poverty in fat, sugar, or total solids, but that it has positively injurious qualities; and that, too, is my own belief."

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

BUILDING A WALL ALONGSIDE AN OLD BUILDING.

HOCHELAGA, June 16, 1887.

SIR: Having profited in the past from the information conveyed in the correspondence columns of the paper, I am tempted to submit the following building problem that has given rise to a discussion amongst builders here. It is desired to build alongside an old building, using the existing wall of said old building, but removing the foundation of stone on which said wall (of brick) rests, and substituting brick instead of stone, and going some fifteen feet below the level of the bottom of present stone foundation. Now, the question is, what is the best method for supporting the old wall while removing the present foundation, and rebuilding the new foundation under it? Of course, no injury must be done to the old wall, and the builders must carry on all operations from the one side of old wall, having no right of entry into the old building. Following sketch may make the question plainer. BUILDER.

A. Stone foundation 15 feet high, about 3 feet thick, to be removed.
B. C. Brick wall varying in thickness as it ascends from say 24 inches to 8 inches, to be supported without injury or going into old building.

D. Additional foundation going 15 feet below present foundation and to be carried up to top of recent stone foundation, which is to be totally removed and rebuilt in brick in line with recent brick wall.

[Our correspondent has a problem which is of almost daily occurrence in any large city, with this important exception that there is a legal right to enter the building for the purpose named: If we mistake not, in New York City an owner of a building is required by law to protect his own wall; in other words, he cannot prevent an improvement on an adjoining lot by making it impracticable to build a foundation to the depth required.

Of course, the very first thing in such a case is to properly brace the wall to be underpinned. Then suitable "needles" are inserted through holes cut in the wall, and wedges driven until the weight is taken off from the portion of the wall to be removed. The proper strain is indicated at once by striking the wall with a hammer. The subsequent operations of removing the wall, laying up a new one, and wedging with iron wedges between stones placed for the purpose, until the weight is thrown on the new wall, we presume our correspondent understands.

Now, if the requirement be *imperative*, that no entry be made to the old building, it complicates the problem, since all support must be from without. In this case vertical slits might be made and carried down to the full depth, and on a sufficient base at each a heavy post be placed, and one or more screw-jacks used to take the strain. Another method would be to use a heavy needle resting on a post (carried down *outside* of the wall) as a fulcrum and weighting the farther end to balance the weight of the wall. There will be a practical difficulty in wedging, but we can scarcely conceive the requirement to be so rigid that a man would not be allowed inside the building long enough to drive the wedges required. Should this be the case it would require a careful study, which had *best* be done by some person familiar with such work.

READY-MADE SPECIFICATIONS.

ALBANY, N. Y., June 21, 1887.

SIR: Can you furnish me with anything which will give a comprehensive specification for a good job of steam-heating for a large asylum building, part direct and part indirect heating? This is rather new to me and I want something which will serve for a general guide for good work.

Yours truly,

D. M. M.

[Such matter can only be obtained from a heating engineer who has had experience with this class of work.

As a general thing every building requires a special treatment and a general specification might lead to very serious blunders in the hands of persons who are not capable of reproducing one themselves.

In our advertising columns are the names of persons whose business it is to advise in such matters and who have had extended practice in designing heating and ventilating apparatus.]

E. G. LOVE, Ph.D., Gas Examiner.

A CORRESPONDENT of the *Electrician* gives the following account of the origin of the disastrous fire at the Théâtre National de l'Opera Comique, in Paris, on May 25:

It was about the end of the first act in "Mignon" when one of the gas-jets in the cross-light sputtered, owing to a shock which that particular cross-light received, due to some stage manipulation. The moment the light reached a sort of net decoration, in close proximity to the cross-light, the net caught fire like ignited gun-cotton. The decorations being so near the gas lights are always very warm and dry, so that they burn like tinder when lighted. The following is a little sketch in cross-section, which shows how the fire originated:

A is the iron frame of the cross-light suspended by ropes G. B is the main gas-tube, which has at regular intervals jets C; D is a sort of wire gauze, and F shows the decoration in front of the cross-lights; E represents the sputter which ignited the decoration F and caused the loss of so many lives and damage to property.

At Lyons the Mayor has issued a decree to the effect that in view of the recent deplorable catastrophe at the Opera Comique, all theatres, *cafe* concerts, and other public buildings in Lyons are, within five months from the present time, to be lit throughout by electricity.—*Electrician*.

THE Municipal Council of Vienna has decided on the conditions which must be observed in the establishment of electric lights in that city. According to these conditions, which are given at length in *Industries*, the contractor will be required to supply electricity to any householder on the lines of his cables, and even in adjoining streets when the demand is equal to five 16-candle-power lamps. The supply of electricity to all consumers will be compulsory from 4 P. M. to 1 A. M.; and when as many as 250 lamps are used by a private consumer, or 50 lamps by the municipality, the supply must be continued for 18 out of the 24 hours. Service wires are to be furnished by the contractor; but the internal wiring of houses will be at the expense of the consumer. The meters must be approved by the municipality or the Government, and the cost of any tests is to be borne by the contractor. The charge for meters has been fixed, and varies from 15 florins per annum for a 10-light meter to 40 florins for a 100-light meter. Each glow-lamp installed will cost the customer 50 kreutzers, besides which he will pay 4 kr. per lamp-hour for the current. Lamps of higher power than 16 candles will be charged for on the same basis. The standard to be used in testing illuminating power of the lamps is the Hefner-Altenack amyl-acetate lamp. Electricity for arc lamps, motors, etc., will be supplied according to private agreement between the contractor and consumer. The supply of electricity is not made compulsory unless the customer agrees to take it for at least one year. The municipality will get 25 per cent. discount on the above rates.

AT the meeting of the American Institute of Electrical Engineers, in this city, June 28, G. W. Blodgett, of Boston, electrician for the Boston and Albany Railroad, read a paper on "The Electric Lighting of Passenger Trains." His conclusion was that the most practicable way of lighting cars by electricity was by means of storage batteries or accumulators charged at terminal points.

PERSONAL.

PRINCETON COLLEGE, at its recent Commencement, conferred the degree of Civil Engineer, in course, on F. F. Bedle, of New Jersey; T. O. Blackwell, of New York; F. W. Jackson, of New Jersey; C. L. Riggs, of Maryland; and Dr. Walker, of Utah.

M. M. GREENE, former President of the Columbus, Hocking Valley, and Toledo Railroad, died at Columbus, O., June 26, aged fifty-seven years.

W. G. GILBERT, Civil Engineer, of Walton, N. Y., has entered the employ of the Chicago, Santa Fe, and California Railroad Company.

THE following changes in the stations and duties of engineer officers, U. S. A., will take effect July 1: Major David P. Heap will report to the Secretary of the Treasury as Engineer of the Third and Fourth Lighthouse Districts; Captain John C. Mallery, on being relieved by Major Heap, will report to the Secretary of the Treasury as Engineer of the Fifth and Sixth Lighthouse Districts; Major James F. Gregory, on being relieved by Captain Mallery, will report for duty as Engineer Secretary of Lighthouse Board, relieving Major D. P. Heap; First Lieutenant John Millis, on being relieved as Engineer of the Third Lighthouse District, will report to Major Heap for duty under his orders; Captain Millard Young, relieved from duty under Captain Charles F. Powell and ordered to duty at Portland, Oregon; Major Joseph P. Farley, Ordnance Department, detailed as a member of the board for testing rifled cannon, vice Captain Charles Thaler, relieved; also in Quartermaster's Department, Major E. B. Kirk, Quartermaster, ordered from Atlanta to Fort Sumter, S. C., to inspect Ordnance Sergeants' quarters being erected there; Major David Perry, Sixth Cavalry, ordered to assume command of the recruiting depot at Jefferson Barracks; Captain A. P. Blunt, Assistant Quartermaster, granted two months' leave of absence; First Lieutenant John T. French, Jr., Fourth Artillery, granted leave of absence from July 15 to September 19.

MR. JAMES S. MARTIN, of Atlanta, and Mr. W. Chamberlin, of Cincinnati, have formed a partnership at Memphis, Tenn., as civil engineers and architects.

CONVENTION OF THE NATIONAL ASSOCIATION OF MASTER PLUMBERS.

(Continued from page 102.)

THE reports of the State Vice-Presidents were as follows: Connecticut led off—Vice-President Robert Morgan, New Haven, stating that "no progress had been made in establishing new associations, yet we are more prosperous than ever before. The membership is good and all are enthusiastic. We are trying to get some sanitary measures passed by the Legislature and have met with considerable encouragement, and think we will have a law regulating plumbing before the present year is closed."

District of Columbia, by Vice-President E. J. Hannan, reported the association now numbered only fifteen, out of one hundred and forty plumbers in Washington. However, the second association that had been formed amounted to nothing.

Indiana was passed for the present, Vice-President J. Giles Smith having removed to Wichita, Kan. Later, James Madden, Fort Wayne, the one Hoosier delegate present, said the association had "lighted up in Indiana only to be extinguished in a short time." A New York closet had been given exclusively to one Fort Wayne plumber who charged the speaker as much as any other party, whereat the speaker kicked vigorously.

Executive Committeeman—That will come under review by our coming committee on protection.

Kentucky—William H. Matlack, Louisville, Vice-President—stands now about as last year. However, we see gleams of revival, and now and then we still hope that our local association will arouse renewed interest.

For Kansas: We have increased our membership here and there, and are much encouraged.

In Maryland, Thomas J. Griffin, Vice-President, reported on the situation thus in the course of a pamphlet report: Our Baltimore association has been increasing rapidly. We have now two additional delegates here and will increase the number still more at the next convention. No new associations can be reported, because there are not more than two or three plumbers, if so many, in any outside town, but we have induced two or three plumbers from the country to join the Baltimore association. The law relating to the examination of plumbers went into effect May 1; 296 certificates have been issued and forty-nine rejections. The Baltimore Resolutions work all right and we are a unit in their favor, unless your honorable body bring forward something better.

In Massachusetts, Vice-President D. G. Finnerty reported no new independent organization, but the Boston membership had risen the past year from 82 to 150—all in good standing [applause]. This increase had come largely from the small cities and towns of the State. Relations with manufacturers and dealers in plumbers' supplies had been very satisfactory and no interruption had taken place from strikes or labor troubles whatsoever.

In Minnesota, said Vice-President Sergeant, of Minneapolis, the local associations of that city and St. Paul are in a prosperous condition. The health boards and the press of the twin cities co-operating, some marked sanitary advances had been secured, and the next Legislature will be appealed to further. However, manufacturers sold to any buyers at about the same figures as to plumbers, and half of the craft were not members of the association, but the creatures of the wholesale dealers who refuse us any favors whatever.

"New York!" called the Secretary, but Vice-President George Cummings was not in the room, and the chair called on Mr. Gabay, who deprecatingly said that Mr. Byrns, "that zealous and noble worker in the great fight we have had," had better be called on. The large amount of work we have had in New York has made it very difficult for the members of the New York Association to assist Mr. Cummings in organizing local associations through the State. We have had our hands full, as you all know, with that very great fight that we have had. In the course of that fight I had occasion to go to one or two of the neighboring towns—as far as Albany at one time—and found their association there had been successful in a strike, and was in a very prosperous condition. It is not needful to go into a synopsis of our own fight—you know its results. It has lasted ten months, and still there is a little lingering work, but as they haven't succeeded at all from the beginning, we haven't the slightest idea that they will have a better time of it.

Mr. Marrin, of Brooklyn, thought Mr. Cummings would have reported, "but for the well-known condition there."

Pennsylvania was called, but Enoch Remick had gone for lemonade, accompanied apparently by his colleague from New Jersey.

Rhode Island's Vice-President, Patrick Tierney, was likewise quaffing the cooling draught.

Wisconsin and W. E. Goodman said the latter had no report to present.

Michigan, too, had the familiar story of strikes. "The Master Plumbers' Association of Detroit are not opposed to any organization that our men may see fit to enter, but we do protest and shall combat against any organization that combines to take away the right of their fellow-men." [Much applause.]

W. E. Foster made a humorous and truly eloquent speech for Virginia, refusing to take the platform, as he must stand by his standard there, as no one else would. He was sorry to say that Virginia had no report. He himself constituted the Masters' Association of the State, being the only member thereof.

The Chair—I will answer for Ohio, as Mr. Rickets, the State Vice-President, is in poor health. We have tried in

my own city of Cincinnati to do all that could be done for points outside.

Missouri was not quite ready to report.

In Nebraska Vice-President D. O. McEwen reported 19 members at Omaha, 12 recruited in the last two months. Lincoln had three members, Beatrice one.

Essays being called for, Mr. Stevens, of Boston, chairman of the special committee, said the list had been duly handed to the Executive Committee.

The Chair—The Committee on Essays have confined members to five different subjects—five important ones—points taken up by medical experts and others, and even by the National Health Board itself. It was thought best to confine ourselves to those five subjects, so that they may be properly discussed here and some sort of decision arrived at as to what is best. For instance, is a trap on a main drain necessary? There is quite a conflict of opinion on that point, and it was in order to bring out the opinions of various localities as to that matter that the subject was chosen. There are several papers presented here, and I await your order as to which to take up first.

Then followed the reading of an essay, entitled "Multum in Parvo," by J. J. Wade, Chicago.

On motion of Mr. Macdonald, New York, the recommendations of the essay were referred to the Executive Committee.

The next essay was by Richard Murphy and J. A. Gibson, Cincinnati.

The paper argued for trap on main drain, and for fresh air inlet opening from the attic, and opposed the present system of ventilation.

Mr. Foster, Virginia, discussing Mr. Murphy's paper, said: "This paper presents a startling idea that may revolutionize the plumbing practice of the country. We possibly understand the hydrostatic paradox that two columns of water, if connected at the bottom, will rise to the same level; and if that is so, why will not two columns of air, which is but a modification of water, composed of the same constituents—why will not they rise to the same level where there is a lack of circulation? Now, take away the hot-air flue, by reason of the fact that the chimney is not in use, and then a matter of fact presents itself parallel to the hydrostatic paradox. In view of the fact, that there may be great import to the proposition, and that it may revolutionize our ideas entirely, I move that it be referred to a special committee of five, of our most intelligent members."

The Committee of five was voted, and the chair named Messrs. Cochrane, Stevens, Moylan, Cauvette, and Tate.

J. Giles Smith, Wichita, Kan., read another paper on the same general subject.

The Apprenticeship Committee reported in favor of adopting the New York Master Plumbers' Association rules on apprenticeship.

Alderman McCoach, Philadelphia, didn't want such an important matter hurriedly decided. The resolutions should be printed and slips provided early in the morning, which was agreed to.

Adjourned till 9 A. M.

SECOND DAY.

The second day's proceedings opened at 10 A. M., President James Allison in the chair.

Delayed reports for States being in order, that for Illinois was presented by Vice-President P. J. Kane, of Alton. He announced the forming of a State Association and one local association with about twenty members. He had received very encouraging replies to his letters sent out through the State, and before the next convention every master plumber would be in the ranks. Our local association is in a very prosperous and healthy condition and is still largely increasing in membership. Mr. Ryan, of the Chicago association, has introduced into the Legislature a bill for the regulation of plumbing and house-drainage in the State of Illinois, and it is expected to pass at the next session. Report accepted.

Ex-Alderman Ryan, Chicago, who introduced this bill, asked for an expression from the convention recommending the passage of the bill.

Mr. Hannan—I move that the convention endorse the bill. Numerously seconded.

Acting Secretary Weaver read the bill and it was unanimously endorsed.

The Financial Secretary announced the arrival of a new delegation headed by George Kendall, of Clinton, Iowa.

Then a paper was read, presented by the New York delegation, on "Trade Schools and Technical Education in their relation to the plumber of the future."

Rupert Coleman, Chicago—Let the paper be referred back to the New York association with the request that they bring into action the suggestions they make to this association.

Alderman McCoach, Philadelphia—Some points are so valuable they should go to the Executive Committee. They touch on a matter more important in my mind than the chance trade school—I mean manual training in our public schools. In Philadelphia we are moving for that, and I have advocated it ever since I have been a member of the city government.

A. Young—The essay just read receives, I am sure, the unqualified endorsements of the National Association now assembled, and I move that steps be taken by the coming administration to put the subject of practical manual training into effect in every State where our association exists.

Mr. Weaver—I second that, for we have struck the milk in the cocoanut. Form your trade schools and you will have no strikes, but better boys. Follow out the system, and at the next meeting of the convention elegant results

will have come from the different local associations establishing their schools. New York has the model school. Five years ago when the school started, the suggestion was made to New York plumbers to take a hand. They were not ready for it then. The times have ripened. We have had our difficulty with the workmen, and all have now taken hold of the good work which Colonel Auchmuty started some seven or eight years ago, and the result is this essay presented here to-day—the most important work of the convention [applause.]

The Chair—I think you all know my position with reference to education and trade schools and I need hardly reiterate my endorsement. Do you approve this motion instructing every local association to start one if possible—in a small way, it is true—but still to start it? Carried, with enthusiasm.

Mr. Macdonald, New York, referred to Colonel Auchmuty's generous financial support of the work, and proceeded: "As a member of the Examining Committee I found great pleasure in examining the boys, who, for five months gave their time to using the tools. The questions asked them were published in THE SANITARY ENGINEER AND CONSTRUCTION RECORD, of New York. Our association in New York furnished a diploma to each boy, and that entitles the boy to one year on his apprenticeship. Let trade scholarships be established so that local associations can send representatives there. I move a vote of thanks to Colonel Auchmuty for the noble work he has performed in establishing the New York trade school."

A. W. Murray, Chicago—In seconding the resolution, I would amend by making Colonel Auchmuty a member of our National Association for all time. Both propositions went through with applause.

John Griffith, of the Chicago Entertainment Committee, announced a boat ride on the lake in the evening and a visit to the training school late in the afternoon.

After considerable discussion both appointments for pleasure were approved, and by way of preparation a continuous session till 3 P. M. was voted.

Copies of the report of the National Association of Builders, with declarations of principles, were distributed through the convention and elicited a formal vote of thanks.

At this point the Sergeant-at-Arms lifted up a vigorous wail—the sheep were all going over the wall.

First Vice-President Trainor (in the chair)—I suggest that if the gentlemen want a drink so badly, we take a recess or have the punch-bowl brought in. [Laughter.]

The report of the Apprenticeship Committee was read by the chairman, Mr. Harkness, Philadelphia, and recommended the adoption of the New York code. A long discussion, the longest of the convention, at once set in.

A. Young—I move to adopt the thirteen resolutions, just read, as a whole.

Objection was raised and they were taken up seriatim, the first hitch being on Section 3.

Mr. Rothrock, Baltimore—I consider it bad practice to employ boys who are not apprentices—a course which that section approves by implication or at least recognizes officially as existing. Boys, when employed, shall be taken as apprentices and for the full term.

Mr. Phillips, Providence—It is these helper boys, taken and discharged at will, who go out and disgrace the trade. Let us restrict this evil just as far as possible.

Mr. Dewstoe—In ordinary times we can get along with our regular apprentices, but during rushes helpers are indispensable.

Mr. Rothrock—Then employ men [applause] day-laborers.

Mr. Dewstoe—The great difficulty is that young men go out after one, two, or three years and get full wages—not by merit, but by the acts of trades unions. I grant it an evil, yet in a trade like ours, which has very busy seasons offsetting the dull ones, we must have extra help.

Mr. Rothrock—It is true that laboring men cost a little more than boys, but we should ourselves make some sacrifices for the good of the trade in general.

Mr. Zumbusch, Jersey City—We can't employ men-helpers, because they will set up almost next day as competitors.

Mr. Reynolds—Sometimes we are compelled to hire fifteen or twenty-five boys. How can we apprentice that many? Impossible!

Mr. Macdonald, New York—The old argument against the American boy. A good boy will come to the top. But for the laborers that we have brought up in New York where would we have been in the last trouble? The journeyman said they would not under any circumstances tolerate a laborer. Don't hamper the American boy, be he whom he may, who wishes to learn the trade.

Mr. Weaver, Philadelphia—By the Deer Park rules the apprentice is apprenticed, in effect, not to the individual, but to the entire association of a city, his time being charged up on each account, the boy uninterruptedly advancing to the journeyman's dignity.

Finally the clause objected to—"boys in his employ who desire to become apprentices"—was stricken out from Section 3, and all was plain sailing till Section 10 was reached, when Mr. Finnerty, of Boston, objected to the clause. "When he (the employer) finds it necessary to dispense with the services of any apprentice." No apprenticed boy, he held, should or could be laid off at any time. If it merely meant, as one explanation had it, to ask a brother employer to find employment for his apprentice, even then it was about time that No. 1 shut up shop. When an apprentice was taken he should be retained until the time of his service was completed; any other apprenticeship was a farce.

Mr. Cochrane, New York—I don't believe there is a bound apprentice in the city of New York—there may be a few who come across daily from Jersey—and the helpers are just as faithful as apprentices.

Mr. Phillips joined in criticizing the section and Mr. Dewstoe approved it. "In fifteen years," said the latter, I have never discharged an apprentice, yet I don't want to stock my shop with labor—any more than with bath-tubs—for five years to come. While no man would discharge an apprentice unless absolutely compelled to, he don't want to bind himself down by a cast-iron rule. The boys haven't a better friend than I have been and am, but they have to take the chances of trade just as we do."

The criticized section then carried with but few negatives.

Next, Section 12, which prohibits an apprentice from joining any trade or labor union, was questioned by a Kings County, N. Y., delegate.

Mr. Gabay, New York—Why do the journeymen unions want the boy to join their association or the junior associations? That is the question each member wants to ask himself when he votes on that section. When he does so, he will vote for it. It is not to benefit the boy, and it is only to injure the employer. When the boy becomes a proficient mechanic and has completed his apprenticeship, then if he desires to join any labor organization, that is his own business, and I am sure no gentleman in this room objects to what organization he joins so long as he does not encroach upon the rights of the employer. But the reason they want the boy is simply that when they declare a strike they may leave your shop without a soul in it. And if they could have done that successfully in New York what could our association have done and where would the plumbing trade of the United States have been to-day if it were not for the noble stand of the New York association? [Great applause.] That was the only salvation the New York association had. [Applause.]

J. J. Hamblin, Chicago, Chairman of the Apprenticeship Committee, being called to take the floor, said the first apprenticeship legislation in the association came from Chicago, and at his instance, he having been set to thinking by his own idle apprentice days in New York under J. P. Quinn, when he played off sick about half the time, really running up and down the Hudson having a good time. The Chicago system works well. "I have to-day sixteen boys in my employ, though one-half are sitting on the bench idle on account of the strike. I have had boys go into the country after two or three years' service, but that time does not serve as apprenticeship work. It is different if I transfer them to another shop—then the time counts. There you have the system in a nutshell, the boy being apprenticed, not exclusively to me, but to the trade here, and every hour's work advances him on his way. I don't see what all this hesitation means—the thing certainly looks very simple to me."

The section passed unanimously.

Mr. Gabay—Does this affect boys now in an organization or not? Does it mean we are to request the boys to resign? [Voice—"And if they won't, bounce them?"]

The concluding section, No. 13, providing that "no employer shall take any more boys as apprentices than he can properly educate and keep permanently," was attacked on all sides. G. S. Paine, Cleveland, wanted to strike it out; Mr. Rothrock defended it, Messrs. Weaver and Dewstoe took a hand, and R. Coleman, Chicago, said: "Employers in taking boys should use their best endeavor to keep them through the whole term of apprenticeship. 'I go farther,' said 'Boston' Finnerty; 'it is his imperative duty to do so; to abridge an apprenticeship is a contradiction in terms, and to transfer one unless you yourself also leave the establishment is not much better."

T. C. Boyd, Chicago—I offer as a substitute for Article 13 the following: "If a master plumber is compelled to discharge an apprentice for want of work, it should be his duty to provide employment with another who has work for him, and can teach him the trade."

Mr. Weaver—I would suggest to put in the following: "Should the employer refuse to give him a recommendation he can appeal to the Apprenticeship Committee of the local association."

Mr. Whitelaw, New York (with some warmth)—It seems to be the standing order to have a discussion on the apprenticeship matter. Some say, don't hire any except bound apprentices. Where would we be in New York to-day—a vital question touching us all, and that may well be repeated—if it were not for these same apprentices that were not bound? Can we keep a boy who is intelligent from learning the trade if he is not bound? He can learn it in spite of the master and in spite of the journeyman, even as a helper. We make a mistake if we go to work and have bound apprentices. "We will make you come to it," the journeymen have been threatening; "we will make you have one apprentice for each four men." We say: "No; we will hire and discharge as we please." We have fought that thing out for ten months—ten long and weary months, and here, apparently, we have to fight it out again, for what else is the meaning of this two hours' discussion. Show me where it is any benefit; show me where we are going to help ourselves by having these bound apprentices, or help them either! The great majority of you gentlemen in this room were never bound apprentices, but picked up your trade, I suppose, in perhaps a half-dozen shops. Do you really want to have this bound-apprenticeship system—have slaves, if you please? In the city of New York, to the best of my knowledge and belief, I think there is only one shop on the whole island that has bound apprentices—Thomas J. Byrne. That is the only one I think of. Did he, by having his bound appren-

tices, assist us in this matter? Far from it, gentlemen. He was one of the first ones to go against us, for all he said in this convention advocating things that I thought at the time were entirely wrong. But after these two hours why continue to discuss this chestnut! [Applause and laughter.]

John Byrns, New York—I desire to say that I am not the Byrne of New York who has the bound apprentices. [Applause.]

The Boyd substitute was then carried.

And then the thirteen sections as a whole were adopted unanimously as a substitute for the previous apprenticeship law of the association.

These resolutions are as follows:

1. The term of apprenticeship at the plumbing trade shall be five years.
2. No boy shall be taken to learn the trade until he has attained the age of 16 years.
3. Each employer shall be required to make a return to the Apprenticeship Committee of a list of the boys in his employ as apprentices, with their ages, places of residence, time of commencing at the trade, etc., and a general record of each boy.
4. The Secretary of the Apprenticeship Committee will keep an apprentices' record, in which will be recorded the name, address, and age of every apprentice, with date of commencing and discontinuing work with each employer.
5. For each apprentice so recorded the secretary shall issue an apprentice certificate to be sent to his (the boy's) employer to be retained by him so long as the apprentice is in his employ. When the apprentice takes service in another shop the certificate is given to his new employer to be filled in with the date of commencement (of service) and so on until the certificate shows that the proper time has been served.
6. Any boy wishing to learn the plumbing trade will be required to send his name and address to the Secretary of the Apprenticeship Committee, who will notify the applicant when to appear before the committee for examination. Each applicant must have a letter of recommendation from a member of the Master Plumbers' Association.
7. A beginner at the trade will be required to work six months on probation, at the end of which he shall appear before the committee for re-examination, and if found worthy his certificate shall be issued; he shall be recognized as a regular apprentice, and the time already spent at the trade shall be allowed on his certificate.
8. When the five years shall have been served, the apprentice shall be presented by the association with a diploma, showing the date of service and signed by the president of the association and by the Apprenticeship Committee.
9. Boys having a diploma from any trade school shall be allowed a deduction of the last year from the term of apprenticeship.
10. It shall be the duty of each employer when he finds it necessary to dispense with the services of any apprentice to report to the secretary the names of such apprentice at least one week before laying him off.
11. It shall also be the duty of the members of this association to apply to the committee when in need of apprentices.
12. No boy shall be allowed to join any trade or labor organization during his term of apprenticeship under penalty of forfeiture of his certificate.
13. If a master plumber is compelled to discharge an apprentice for want of work, it should be his duty to provide employment with another who has work for him and can teach him the trade.

The Committee on Resolutions then submitted its recommended list, as under:

No. 1, by the Philadelphia delegation, requesting that master plumbers throughout the country shall be ranked as dealers by the manufacturers of terra-cotta pipe.

Henry Smith, Philadelphia—Are we not starting a boycott principle? We say to Knights of Labor, "We won't allow you to dictate to us," and here we go right around and discriminate against our own fellow-craftsmen.

Mr. Hannan—We simply request the dealers, and we only speak of ourselves, of course.

Mr. Sullivan—All plumbers, whether in the association or not, desire the benefit of our victory.

Mr. Smith—Let the words be inserted, "All plumbers of the country be classed as dealers," etc.

Mr. McCoach—There is no boycott. The manufacturers raised the price twenty-five and fifty per cent on the plumbers, but not on the others. Make us like the others.

Mr. Macdonald, New York—I would suggest "all plumbers' material," instead of "terra-cotta."

Mr. Whitelaw—And I would substitute the broad word "dealer."

Mr. McCoach explained the circumstances leading up to introducing the resolution.

Mr. Byrns—As Chairman of the Committee on Resolutions, I hope the proposed substitute of "dealers" will not prevail. We are here to legislate for the men connected with this national organization and for no other man. As to the intimation of the gentleman from Philadelphia that we are attempting to boycott somebody, there is nothing of the kind; we are legislating for our constituency. There are good reasons why the clause referred to should be left as it is, but which it is probably not policy to explain on the floor of this house. [Applause.]

Mr. Macdonald—I hope the committee will accept the words, "all plumbers' material." Terra-cotta is nothing in our city to what we want. [Voice—"Putty!"] Yes, putty. [Laughter.]

Mr. Byrns—The committee accepts the substitute of Mr. Macdonald. [The latter—I thank the committee.]

Mr. Sullivan—Also the words, "all plumbers." I make that amendment.

Mr. Byrns—I move that we lay the amendment of Mr. Sullivan, of New York, on the table. Carried.

Then the original resolution, as amended by Mr. Macdonald, was passed.

The Committee on Resolutions then reported unfavorably on the paying of the principal officers, but recommended instead the payment of a Grand Secretary under a salary to be fixed by the Executive Committee, who shall devote his whole time to the duty of the National Association under the direction of the president. [Chorus of approval.] The Grand Secretary would not take the place of the Secretary.

The Hudson County, N. J., delegates opposed all salaries. All our delegates are not here because we could not afford it, and we certainly cannot stand additional taxes. Volunteers will take the place for its honors.

Mr. Cochrane favored it; also Mr. Macdonald, who, as a member of the Executive Committee, had seen the necessity for such a paid officer. We know what money did in New York City—it was sink or swim there, and we were willing to put our hands in our pockets, and we are willing to pay well for what is before us.

Mr. Byrns—The remarks from Hudson County, N. J., recall the fact that Newark, with a population of over 100,000, and a large number of plumbers, is not represented here, and the object of appointing this secretary is just here, to build up our organizations in such places as that where it is needed. At the beginning of the New York strike we employed a clerk on a salary, and he paid for himself twice over by the number of new recruits he secured and the supposedly bad debts he collected. And we have a large number of ornamental vice-presidents throughout this country [applause]. New York State should have not two but ten associations of master plumbers. Buffalo, with over 200,000 inhabitants, is not represented here; Syracuse, Rochester, Albany, Poughkeepsie, Troy, Utica—all those cities will be here [applause]; and if we get a good man—call him Grand Secretary, for that gives him title and dignity, and that goes a great way in this country [applause]; we will call him "Grand" if it doesn't cost anything—you will find that it will pay. There will not be a dollar of additional taxation on the associations; our membership the first year will run up to 250. Adopt the resolution. It is left to safe hands—in executive officers selected by yourselves. Hudson County itself will thank us. [Applause.]

Hudson County—It burst our bank to get here; no more taxes. Our association numbers twenty-six, both poor and lukewarm. We paid our own fare here, but with increased taxation we will have no one to represent, for we cannot carry the expense of the whole affair on our shoulders.

Mr. Paine, Cleveland, favored the Grand Secretary heartily, and Mr. Macdonald, New York, likewise; also Mr. Weaver and Alderman McCoach, the latter being won over by the eloquence of the arguments, and willing to go right down then and there to help poor Hudson County to the next convention. [Applause and general good nature.]

President Allison—The Chair, not to enter on any argument, could tell you good reasons why we need new ways and means to set forward our work.

The post of "Grand Secretary" was then created unanimously.

Resolution 3, by the President, recommending to local organizations to provide for the education of the coming plumber by the establishment of trade schools, reading-rooms, lectures, etc., was carried without discussion.

Resolution 4, by the President, recommending that contracts for plumbing work be made direct with owner or architects, was similarly carried.

Resolution 5, approving of the union of the New York Master Plumbers in their battle for the boys, passed unanimously.

Resolution 6, reaffirming the declaration of principles adopted by the National Builders' Association, passed unanimously.

Mr. Dewstoe—We should have some plan by which local associations can stand by one another in case of difficulties; as, for instance, the Cleveland strike.

The Chair—I think the committee understand about what is desired in that matter.

Resolution 7, recommending to the Executive Committee to consider the feasibility of establishing purchasing agencies, was approved by the committee.

Mr. Gabay—I hope that won't be adopted. I don't see why this association wants to go into the business of material dealer and supply house and become a co-operative society.

Mr. Hannan—Your Executive Committee have good reasons for its recommendation.

The Chair—We were all for it.

The resolution was adopted.

Resolution 8, constituting the State Vice-Presidents so many committees of one, as it were, to hear or receive complaints in their respective States of any violations of the protection rules by dealer, master plumber, or manufacturer, was recommended for adoption.

Mr. Whitelaw wanted the duty devolved on the Grand Secretary.

The Chair—It is an assignment that meets some complaint as to the State Vice-Presidents. I have always held in my own mind that the office was not what it should be, because, while desiring something to do, it really had very little to engage its attention. Now the gentlemen will know what they have to do.

The resolution was carried, as were the resolutions, then, as a whole.

The report of the Committee on Essays was presented by Martin Moylan, who said: "Your committee, to whom was referred the consideration of trap on main drain, etc., discussed in Messrs. Murphy's, Dunnett's, and Smith's papers, beg leave to report that while recognizing many important features, points and suggestions recommended by Messrs. Smith and Dunnett, they approve that system advocated by Mr. Murphy, except soil and waste pipe terminating between roof and ceiling, which we recommend in all cases to be continued above the roof, the vent to be carried at least five feet higher than the inlet-pipe, the cap without a ventilator."

Mr. Gabay moved the report be received. Carried.

The Auditing Committee reported the treasurer's report correct.

The State Vice-President of Missouri reported an eventful year, marked by labor troubles, but that the St. Louis association is now stronger than ever, having 113 members. The rivalry among jobbers and manufacturers makes it a difficult matter in outlying points to operate the protection policy, new arriving firms selling sometimes to outsiders. The Kansas City association has twenty-eight members; twelve added in six months, with five applicants throughout the State. Our relation in St. Louis to the supply houses is of the most friendly nature.

Quite a wrangle followed between Delegate White, Denver, and the Missouri vice-president. The former was supported by Delegate McCarthy, Denver, who said: "We want some support in the fight we have undertaken in regard to the Baltimore Resolutions. You have got to support the plumbers in this National Association if you want to have a National Association."

Mr. Finnerty, Boston—Regarding all that, the convention last year voted local option to the association.

The Chair—Yes, to make the best terms they could.

An Officer—This belongs to the Protection Committee, and it is proposed to take these matters more actively in hand, this kind of business being mapped out, and one man secured on a salary to give his entire time to it, seconded by vigorous vice-presidents.

Again St. Louis came to the front for another half-hour, this time the central name being J. P. Gallagher, of that city, who, it was developed, had sent in an essay without home endorsement. Major Foster, Virginia, in the name of courtesy, wanted a reference to a committee.

Major Foster's resolution was tabled and the essay ordered returned.

A. Young—If under our present government we haven't power to aid local associations when in distress, let us now know it. How was it in New York, Mr. President?

The Chair, alleging modesty, asked Mr. Byrns to answer. "I have no doubt," replied the latter, "that the National Executive Committee did all in their power. They gave us all the moral force that they could. They came and attended our meetings, and when the journeymen wanted to know what they were doing in New York, I said: 'You will find out in a little while it is a very bad general who will announce his plan of campaign before the battle takes place.' The president and traveling companions, I desire to say, rendered all the assistance they could; they met in our rooms and laid out the plan of campaign, to not hire any more men than they could throughout the country; to —"

The Chair (interrupting)—It is my wish, as the general referred to, that the plan of campaign be not given to the public. I think it would be altogether and highly improper to give away any of the plans. I don't think Mr. Young desires it.

A. Young—I desire to know if there is sufficient power in the President and Executive Committee to render such assistance as is desired in such an emergency.

President Allison—I would say no; we are not provided as we should be for meeting such a contingency.

A. Young—I move you that a committee of five be appointed to draft as a by-law a resolution covering just such an emergency.

Mr. Cochrane, New York—I second that.

Mr. Macdonald—I move as an amendment that the Executive Committee have full power to use all means and prerogatives possessed by this convention itself in an emergency like that in New York. I say to Mr. Young that we were helped by the visits paid us, and let us clothe them with still greater prerogatives for unusual occasions, making the Executive Committee really the National Association in adjourned session.

Rupert Coleman, Chicago—I think the relation of the national and local association should have more consideration than we have accorded to it. In case of strike, the issues underlying it may be of importance to the whole country, and clearly the local association should not be left to bear the burden alone, but contrariwise, should be upheld by every resource of the national body, or possibly enabled to make a graceful retreat from an erroneous position.

Mr. Dewstoe—It is most timely to devise some such way to throw to one point our concentrated force. For several years to come I think we have got to stand in a sort of attitude of armed neutrality until trades-unionism has run its little course of fever and died out.

Mr. McCoach said Mr. Young's motion involved a greater expenditure than the fixed and modest sum provided in the constitution and by-laws.

A. Young—In order to assist such distressed local associations, let the Executive Committee be empowered to raise any amount of funds by assessment or otherwise.

Mr. Gabay endorsed this.

Rupert Coleman then moved as an amendment to the constitution and by-laws—A. Young accepting the substitute—the following, and it was unanimously adopted:

"That it shall be the duty of the National President, in case of strikes, to call upon the association involved for a statement of the nature and cause of the strike. He shall then, at his discretion, proceed to the scene of action, or call for a meeting of the Executive Committee to take such action as may seem advisable and call upon the local associations for such aid as it may be possible to render."

Adjourned till 9 A. M. Thursday.

THIRD DAY.

The third day of the convention began with a report from the Executive Committee on their conference the

afternoon before with the committee of the metal workers, the gist of the statements being "they are heartily in accord with us in the interest of the plumber, and assured us they would abide by existing resolutions and would gladly attend, when called on, any meeting of the Executive Committee."

Financial Secretary Remick—"Two more 'counties' are heard from—Terre Haute, Ind., and Rockford, Ill., with Samuel N. Jones and William T. Pierrepont."

The next meeting place was then determined, the cities nominated being Boston, by Mr. Stevens, seconded by Mr. Boyd; New York, by Mr. Cochrane; Philadelphia, by P. Sanders; Washington, by Mr. Hannan. Several brief and breezy speeches were made, and Boston was unanimously selected; whereupon Mr. Stevens, for the Bostonians, expressed thanks, saying they would have the bean-pot boiling, and Mr. Dacey, as a professor at Harvard, invited all to inspect the plumbing of that institution.

Mr. Weaver moved that the incoming Executive Committee consider the feasibility of amending the constitution so as to admit Canadian plumbing associations. Mr. Gabay opposed this, and the motion was heavily defeated.

The election of officers being in order, the chair appointed Messrs. Ryan, Gabay, and Schulhafer as tellers.

For President, John Byrns, of New York, was put in nomination by ex-Alderman Ryan, of Chicago, who said: "We are about to lose the valuable services of our present president, as competent and capable a man as the craft has in the United States. To succeed him I nominate one who is worthy the confidence of the entire association; a man whose name has gone forth throughout the land as a mighty power in the plumbers' cause."

For the same office, Mr. Hannan, of Washington, nominated John Trainor, of Baltimore, as one who, in the position of First Vice-President, has done his entire duty, as also throughout his four years' continuous service in this body, and by merit and precedent has earned the highest promotion.

Mr. Sheehan, St. Louis, seconded Mr. Byrns as the standard bearer in the fight so gallantly waged for the past eight months in New York for the life of the association's principles there and throughout the country. [Applause.]

T. C. Boyd, Chicago, said that Trainor, as president, and Byrns, vice-president, would make a strong team. J. J. Wade, Chicago, wanted Trainor, an honorable representative plumber, and Robert Griffith, Chicago, wanted Byrns, a fighter and man of iron. The Baltimore candidate has not passed through the fire that the New Yorker has gone through unscathed. [Voice—Give him a chance!] No, sir! It is dangerous, with a battle raging give us the tried general [applause]. Mr. Rothrock, rising, said that while Byrns was a local hero, Trainor was equally a hero in Maryland, where something had been accomplished the past year as well as in New York. Trainor was mainly instrumental in securing a most important legislative victory; and while Byrns—at least till lately—was almost a stranger to the whole membership of the National Association, Trainor had been here at every convention, and an officer, doing his whole duty in every part. A. W. Murray, Chicago, in a short speech, eulogized Byrns as a proved match for trades-unionism, a despotism equal to anarchy. A Denver delegate, in a mirth-provoking harangue, wanted no Byrns in his.

The ballot gave Byrns 122 votes and Trainor 41.

Mr. Trainor—On the part of the gentlemen who were kind enough to present my name, I take great pleasure in moving that the vote for Mr. Byrns be made unanimous. Carried. Whereupon the new president was conducted to the platform by Sergeant-at-Arms Collins and Mr. Trainor, and, after a few words by the genial Allison, responded to the applause as follows:

Mr. Chairman and Gentlemen: I need hardly say how deeply and how much I appreciate the honor that you have just conferred upon me. If I had consulted my own feelings I should positively have declined, but I felt that this is a public trust that should not be sought for nor declined. I accept the distinguished honor which you have bestowed upon me, and I appreciate it the more from the fact that I did not solicit it, nor do I know of any one who solicited it on my behalf, for if I had known of such a thing I should have stopped it. I will attempt to perform the duties of the position to the best of my ability. In assuming the office, I have no friends to reward or enemies to punish. I have charity to all and desire to have malice toward none. I desire to be president of the whole organization throughout the country, not of any particular section or place. We have here one flag and one fold, and I will try to be as good a shepherd as I can. I am proud to preside over a meeting of this kind, a large, intelligent, respectable, honest body of men, who have assembled from all parts of our beloved country, coming here at a loss of time and money to themselves and their local organizations, that they might advance the interest of that trade and profession to which we have all devoted our lives. We have here a truly representative body. The Pilgrims of Boston are here; Divine Providence has sent us a Phillips; we have our friends from the Sunny South, and even the Quakers from Philadelphia are here. Gentlemen from the land of the Sierras are here, and even St. Paul is with us, I am prouder to preside here than I would be over any legislative body in this country and it would be well for the people of the various States if their legislatures were composed of a class of men so disinterested, so zealous and so honest as the men on the floor of this house. I am not vain enough to suppose for a moment that I am the only one who you have done me is a personal token that it is shown to the great city of New York which I represent her on the floor of this

question about that. I am not a hero, as some too partial gentlemen have said; I am simply acting a part with a band of heroes. My Chicago friend Hamblin marched with Sherman from Atlanta to the sea; I have marched from the ocean to the lake with a band of heroes and every man a veteran in the cause of honesty, truth, and right. I will not go into the details of our strike, the time being limited, and simply call your attention to one or two matters, and first that during this coming year we want no ornamental vice-presidents nor ornamental committees of any kind. Delegations will act accordingly and elect no man as a State Vice-President who is not willing to put on the harness and work from this henceforth. Every city in this country should be organized and every man should leave this hall determined for himself to solicit his neighbor, show him the great advantage of belonging to an organization of this kind. Establish your local organizations; show them the great power and the great strength of this organization. We must fight organization with organization, and you should go home to your various States and cities each man determined to perform his part in the great work that we have started out to accomplish. If you will do that, you will then advance the interest of the profession and advance yourselves. We are living in a time of progress and the valuable papers read here show that the plumber is advancing with the times. Let us then go from this hall, when we adjourn, to our homes, tell our brothers in the profession of what this convention was composed, invite them if they haven't already joined the local organizations, to do it, urge men in the profession in the adjoining cities throughout the States to form local organizations, so that when we meet at the Hub of the Universe we will have at least 250 representatives on the floor of Boston. I will not detain you any longer, gentlemen, but again thank you for the great honor you have done me, and on behalf of the New York delegation I return sincere thanks. [Much applause.]

John Trainor was unanimously elected Vice-President, and, when Sergeant-at-Arms Collins, with his "Brooklyn Bridge move," had landed him on the rostrum, said: "I owe you all a double debt of gratitude to-day, first for this honor that is to me most important; and also I thank you very kindly for not putting a greater responsibility on one so young in years and in association. I never sought the office I held last year. I will continue to do what I conceive to be for the very best interest of my home association and the National Association wherever it exists." [Applause.]

Mr. Weaver—I move that the President name the Secretary. Carried; and Mr. Byrns named H. G. Gabay, New York, who was confirmed as Recording Secretary; and later the President named Walter T. Hudson, Kings County, N. Y., Corresponding Secretary.

For Treasurer two nominations were made, M. J. Lyons, Brooklyn, the incumbent for 4 years, and J. J. Hamblin, Chicago. Mr. Finnerty, Boston, commended Mr. Lyons' faithful service, and also thought President Byrns should have all his cabinet close at hand. "I am requested," said a Chicago delegate, "by Mr. Hamblin, to withdraw his name in favor of Mr. Lyons;" and that gentleman was elected and thanked the house.

Enoch Remick, Philadelphia, was re-elected Financial Secretary, and D. J. Collins, St. Louis, Sergeant-at-Arms, Mr. Stevens, of Boston, saying he considered Collins specially created for that office, despite the silk flags lost at Deer Park. Collins, after some pleasant horse-play, assured the association he would find those flags if he had to invade Maryland and continue the walk to Boston.

For Auditing Committee the following were elected: William H. Rothrock, Baltimore; M. J. Duffy, Louisville; E. C. Cauvet, Minneapolis.

Enoch Remick brought up the question of *per capita* tax, and on motion of Mr. Sheehan it was left with the Executive Committee.

Martin Moylan moved an amendment to the constitution adding all ex-presidents to the Executive Committee.

Mr. McCoach thought the hour too late, and Mr. Weaver moved to refer it to the incoming Executive Committee to report at the next convention. Mr. Gabay thought the Executive Committee large enough. Mr. Weaver's motion carried.

J. J. Hamblin moved that all officers and National committeemen, whether delegated or not by local associations, should have all rights of the floor, including a vote.

Colonel Scott, New York, opposed the motion, as did Alderman McCoach and Treasurer Lyons. The matter was referred to the incoming Executive Committee to report after their first meeting to the local associations.

Thanks were voted to the local association, the press, and the public. Also, at the instance of their fair visitors, to the Chicago ladies and the Entertainment Committee.

State Vice-Presidents were selected by the different delegations as follows: Illinois, A. W. Murray, Chicago; Massachusetts, D. G. Finnerty, Boston; Nebraska, D. O. McEwen, Omaha; Maryland, D. W. Mitchell, Baltimore; Ohio, Richard Murphy, Cincinnati; Colorado, T. J. White, Denver; Michigan, John Cameron, Detroit; Indiana, James Madden (named by the President); New Jersey, Michael D. Moran, Jersey City; Missouri, Henry Goss, Kansas City; Kansas, John E. Ford, Newton; Kentucky, Simon Schulhafer, Louisville; Wisconsin, W. A. Goodman, Milwaukee; Minnesota, John Shea, St. Paul; Connecticut, Robert Morgan, New Haven; Virginia, W. E. Foster, Norfolk; Pennsylvania, James G. Weldon, Pittsburgh; California, J. L. Firman, San Francisco; Tennessee, J. L. Park, Nashville (named by the President); Rhode Island, William Whipple, Providence; District of Columbia, R. G. Campbell, Washington; New York, William Young, New York City.

Mr. Allison, in a neat farewell, surrendered the chair to his successor, and forthwith the Executive Committee was announced by President Byrns as follows: G. A. Scott, New York; E. J. Hannan, Washington; Jeremiah Sheehan, St. Louis; William Harkness, Philadelphia; Rupert Coleman, Chicago. Also the following committees: Apprenticeship—J. J. Weaver, Philadelphia; J. J. Donnegan, St. Paul; J. J. Hamblin, Chicago. Conference—William F. McCoach, Philadelphia; Isaac Riley, Boston; W. E. Goodwin, Milwaukee. Essays—Alexander W. Murray, Chicago; Martin Moylan, Chicago; T. C. Boyd, Chicago (declined, and P. Nacey, Chicago, substituted); J. J. Wade, Chicago; Robert Griffith, Chicago. Legislative—William F. McCarthy, Topeka, Kan.; Martin Moylan, Chicago; William T. Dunnett, Baltimore; J. A. Rossman, New York; S. J. Nolan, Cincinnati. Sanitary Committee—the State Vice-Presidents.

The convention stood adjourned.

NOTES.

Over the President's chair was a draping of flags with an eagle in the midst, and the motto: "Welcome—They builded better than they knew."

A Chicago paper described President Allison as looking more like a bank president than a plumber. It might have added that Byrns, of New York, and Campbell, of Washington, looked like United States Senators.

Thursday evening at the Grand Pacific Hotel, a reception and banquet were given the visiting plumbers and their wives by the Chicago association, and it was a handsome affair in itself and its appointments. There were four hundred covers, and the after-dinner speeches were in happy accord with the occasion. Among the speakers were Mayor Roche, Health Commissioner DeWolf, President Byrns, Ex-President Allison, Robert Griffith, Architect Adler, George C. Prussing.

It is hinted A. Young is the coming Grand Secretary.

The last day of the session Robert Sprout was present, representing Grand Rapids, Mich.

About a score of plumbers were accompanied by their wives, and a series of entertainments were given them by their fair hostesses. An interesting feature in which the ladies took the lead was the presentation at the Thursday evening reception of a marble clock to the retiring President and other rich mementoes to the retiring First Vice-President and Recording Secretary. Mrs. Shulhafer, of Louisville, and Mrs. Trainor, of Baltimore, chaperoned the diamond-begemmed committee. Apropos of the last clause, a blinded beholder whispered into a dainty seashell of an ear, "Her Majesty hasn't the only Kohinoor."

Wednesday at 4 P. M. the convention, almost in a body, visited the Manual Training School, at the closing exercises, and expressed themselves much pleased.

The Chicago Reception Committee began work early Sunday morning, when the St. Louis and Kansas City delegations arrived. Of the twenty-five Committeemen, the following seemed everywhere present: John Griffith, President of the Chicago Association; Jack Hamblin, James Roche, Joseph Clark, Alexander W. Murray, Wm. Sims, Michael Riley, Joseph Alcock, Frederick Neustadt, J. T. Wade, James McGinley, and Andrew Young, Chairman.

ANNUAL MEETING OF THE AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.

(By Our Special Correspondent.)

ST. PAUL, MINNESOTA, June 25.—The twentieth annual session of the American Railway Master Mechanics' Association was held in the Chamber of Commerce in this city during the past week. Hon. C. D. Kerr welcomed the association on behalf of St. Paul at the opening session Tuesday, and Thomas Cochrane, Jr., spoke in behalf of the Chamber of Commerce, extending also a hearty welcome. The annual address of President Johann was not long and quite general in its nature. He referred to the deaths of President William Woodcock, George Colby, W. W. Evans, H. G. Brooks and George E. Howe, members of the association. The convention adjourned for one-half hour out of respect to the memory of the deceased president, and resolutions of respect were adopted on his death, supplemented by eulogistic remarks by Messrs. J. N. Lauder, H. N. Sprague, Angus Sinclair, R. H. Briggs, President Johann, and Secretary Setchell. The subject of soft-coal using was then considered briefly, and a more interesting discussion followed brought out by the topic: "Is the Extension Front End Applied to Locomotives Economical?"

Secretary Setchell asked if it was not cheaper to clean out the accumulation of sparks and put them where they ought to be, than to have to be continually paying damages for forest fires.

J. N. Lauder said that for three years the Old Colony road had been using the extension front and smoke arch exclusively, and was now putting them on the engines. Smoke was another nuisance from the diamond stacks. He had met with considerable difficulty in getting a proper draft, so, instead of bringing the exhaust-pipes out of the bed-plate in the centre, he brought them out where the lead pipes usually go in, thus leaving a chance for a free draft for the flues directly in front of the smoke-arch. Since using the extension front the danger from fires had almost entirely disappeared.

John Hickey said that he was using the extension front on his road and found it saved fuel, sparks, and smoke. He advocated a tight front end.

John McKenzie did not believe in the extension front. He gave as reasons that they weighed about 5,000 pounds

each, and that such a dead weight on the front end was not practicable; that there was less danger from a properly constructed stack and arch than from the extension front, and that there was need of extra help to clean out the front, which needed cleaning twice in every run of about 140 miles.

Mr. H. L. Cooper thought the properly constructed arch the correct thing. If there was any extension front to be added to an engine it ought to be on the drivers.

Mr. H. A. Town thought a committee should be appointed to investigate the matter, and expressed the opinion that in the past the committees appointed by the association had not paid the attention to the matters given them to investigate which they should have done.

E. M. Roberts favored the extension front. He thought an improvement needed was something to catch small cinders. He used a 13-mesh with three wires, but had some difficulty. He corrected Mr. McKenzie on the weight of the front, claiming that it only weighed from 1,000 to 1,500 pounds instead of 5,000.

R. H. Briggs said some people built an engine as they would a house, with fancy points and with no reference to utility. He held that uniformity in construction would produce the best results.

James Meehan said that the average consumption of fuel on the Cincinnati Southern for 1881 was 91 pounds per mile, with \$33,000 paid for fire damages; while last year, with the extension fronts, the average was only 62 pounds per mile, and not a dollar paid out for fire losses.

The second day's session began with a report from Secretary Setchell, showing that during the year 29 new members had been added, 5 had died, 5 resigned, 13 had been dropped, 4 had become honorary members, leaving 251 full members, 41 associate members, 14 honorary members—a grand total of 279. The treasurer's report showed expenditures during the year of \$1,934.54; balance on hand, \$497.22.

Messrs. Charles Blackwell, F. L. Wanklyn, and T. E. Bennett presented a report on the "Proportion of Locomotive Cylinders," which was accepted and ordered printed.

"Traction Increases—Their Types and Relative Merit; also Causes in which their Use can be Recommended," was the next topic discussed.

Messrs. Briggs and McKenzie stated that they had fitted up an engine with a traction increaser that would use one box of sand a week, while the ordinary sand-box had to be filled two or three times each trip. Secretary Setchell was in favor of an increaser. Mr. Lauder thought an increaser might be well in theory, but not in practice.

The committee on "Crossheads and Guide-Bars—The Various Types in Use, Materials, Construction, and Results Obtained," were not prepared to report and were continued another year.

The report of the committee on "Steam Packing" was presented by Messrs. J. W. Stokes, Allen Cook, Henry Schlocks. Under the head of special subjects H. N. Buford wanted to know the average number of miles a locomotive ought to run on a pint of cylinder oil. He considered 75 miles enough, but had heard men talk of 175. Secretary Setchell thought 75 miles a fair average. Mr. McKenzie stated that his passenger locomotives ran 116 miles on a pint of oil, and one engineer had run 232 miles. T. J. Hatswell said that on a test he had thus run an engine 360 miles. President Johann stated that he had found the least expense in running an engine had not always been the most economical.

"Increased Boiler Pressure" was the subject of an extended discussion.

Mr. Lauder said it was no use to attempt to start out with low pressure to compound the steam. It was not economy to cut off the steam in a 24-inch stroke to six inches. He had used 175 pounds pressure with decidedly good results. The great question was, How to get more power without increasing the weight. Large cylinders must not be used, however, as there was trouble to get the steam. With the right kind of a boiler he did not think it would be unsafe to carry 200 pounds of steam with a locomotive to maintain it.

Mr. Howison thought 200 pounds could be safely carried, but the steam would be saturated and not superheated. He thought it would not be long before fast passenger engines would be carrying from 225 to 250 pounds to the square inch.

Mr. Hickey held that the amount of the pressure would depend upon the strength of the boiler and the adhesion to hold it. If more power was needed, increase the size of the boiler. Superheated steam would make it difficult to lubricate the cylinders.

Mr. Ames offered a resolution to the effect that it was not advisable to raise the boiler pressure above 135 pounds per square inch on the freight service.

The third day's session began with a paper on "Coaling up Locomotives, The Various Plans in Use and Their Relative Cost and Efficiency," presented by J. P. Barnett, James Strode, and Charles Graham. The paper was accepted as the report of the committee.

G. Ettenger, W. H. Thomas, and T. W. Gentry reported on "Locomotive Preparation." This report concluded as follows:

"Your committee conclude that with boilers that are constructed with reference to being easily accessible to all their interior parts, the best system for washing out is by means of a high-service storage tank in connection with a stationary boiler and proper piping for blower and blow-cock connections and the steam-boiler wash-out of which there are several good ones on the road. The live engine is to contribute its steam to the wash-out tank,

and in return, when washed, to receive its fill of hot water from that source."

Mr. Ettenger read a letter from an electrician, holding that locomotive fires could be more cheaply started by electricity.

Mr. Lauder presented a scientific report of a test made at the Watertown, Mass., arsenal on sections of three and four-inch tires, showing that there was no difference in density considered from a scientific standpoint. Reports were made on "Standard Form of Tire Section" and "What Control has the Engineer over the Driving Wheel?"

The officers for the ensuing year were elected as follows: President, J. H. Setchell, Dunkirk, N. Y.; Vice-Presidents, R. H. Briggs, Argentine, Kan., John McKenzie, Cleveland, Ohio; Secretary, Angus Sinclair, Chicago; Treasurer, George Richards, Boston, Mass.

E. D. Anderson, of Vicksburg, Va., was elected to the subject committee to serve three years, vice T. B. Twombly, of Chicago, whose term had expired. It was decided to meet next year at Alexandria Bay.

The topics decided upon for discussion at the next annual convention are as follows:

1. Relative proportions of cylinders and driving wheels to boilers.
2. Guides.
3. Extension smoke-boxes and brick and other fire-box arches.
4. Spring and equalizing gear.
5. Tires—advantage or otherwise of using thick tires.
6. Purification or softening of water before being delivered to locomotive-tenders.
7. Prevention of dangerous escape of fire coals and sparks from ash-pans.
8. Tender-trucks.
9. Traction increasers, in connection with over-cylindered engines.

MOVING OF A RAILROAD BRIDGE.

In the improvements on the Pennsylvania road, it became necessary to move an iron bridge weighing 160 tons, 50 feet sidewise.

The feat was successfully accomplished by the use of a temporary trestling supporting four lines of iron rails, and four compound and four single-gear crabs. The rails were thoroughly greased. The arrangements were all carefully tested, and the time occupied after movement began was 11 1/4 minutes. Thirty-two men supplied the power, and the connections were made and trains running in half an hour.

PERSONAL.

JAMES S. MCENTEE, civil engineer, died June 30, at Rondout, N. Y.

THE convention of the American Institute of Mining Engineers will begin at Duluth, July 26.

CHIEF ENGINEER HENRY LEE SNYDER, U. S. N., Superintendent of the State, War, and Navy Departments Building in Washington, died June 30 in the 50th year of his age.

A. A. TALMAGE, General Manager of the Wabash, St. Louis, and Pacific Railway, died June 28 in the 54th year of his age.

GOVERNOR HILL has approved the bill providing for the modified commission on subways for electric wires in New York City.

ARCHITECTURAL COMPETITIONS.

EVANSVILLE, IND.—The competition for the plans for the new court-house, to be erected here, was decided, June 25, in favor of H. J. Walters, of Louisville, for first premium of \$500; W. H. Decker, formerly of Cincinnati, now of Philadelphia, for second premium of \$300; H. B. Wheelock, of Chicago, and F. J. Schlatter, of Evansville, for third premium of \$200. There were eleven competitors submitting designs. Among them were S. Hannaford, of Cincinnati; McDonald Bros. of Louisville; Cochran & McKean, of Chicago; Bunting, of Indianapolis; Clark & Saur, of Evansville. The new building will cost a half million dollars complete.

THE Board of Public Works of Milwaukee ask for plans and specifications for a school building, not to cost more than \$30,000 complete. The competition will close August 1.

The board also wants plans, until July 18, for a \$25,000 school building; also, until July 18, plans for a \$30,000 school building.

ENGINEERING COMPETITION.

Colonel J. M. Wilson, Lieutenant Colonel Peter C. Hains, and Major G. J. Lydecker, a Board of Engineer Officers, who have been considering the subject of a bridge across the foot of Pennsylvania Avenue, have made a report to the Secretary of War approving Lieutenant-Colonel Hains' report to the Chief of Engineers on the bridge question, and recommending that plans and prices on a bridge shall be advertised for.

NEWARK, N. J.—The discussion over the success or failure of the new sewerage system has led to a division by Council, at request of the engineer, Mr. Schaeffer, to appoint a committee of expert civil engineers to pass upon the work.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

Persons who make any use of the information they find in these columns will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 117-119-120.

WATER, SEWERAGE, ETC.

WATER COMPANY.—Articles of incorporation were filed June 14 by the Pacific Water Company. The purpose is to acquire water and water-rights, and sell the same, in the San Gabriel Valley, Cal. The directors are: H. H. Markham, L. W. Dennis, Nelson Vanderslip, and C. H. Bradley.

SAN DIEGO, CAL.—E. A. Beardsley, J. M. Logsdon, E. W. Fairchild, and C. W. McMaster have purchased the controlling interest in the Mokelumne Ditch and Irrigation Company in Calaveras County. The object of the company is to utilize the Mokelumne River for irrigating San Joaquin County by means of canals and ditches from the dam at Westmoreland's bridge, and about 300,000 acres will be covered. Immediate action will be taken.

BUFFALO, N. Y., wants a 20,000,000-gallon pumping engine. See proposal column.

COUNCIL BLUFFS, IOWA.—The water-works will lay about four miles of pipe this year.

JANESVILLE, WIS., is agitating for a system of sewers.

ALLENTOWN, PA.—The Board of Water Commissioners will visit New York, Brooklyn, Fall River and other cities, before acting on the bids recently submitted for pumping machinery.

SEWERS.—Governor Hill has signed the bill providing for the Gravesend sewer.

TAUNTON, MASS.—The Water Commissioners will sink wells at the pumping station, to secure a more abundant supply of water.

NASHVILLE, TENN.—The Water-Works Company asks for proposals for building a reservoir. The estimated cost is \$434,000.

PASADENA, CAL.—The City Council has appointed an election, to vote upon the raising of \$192,000 of bonds for sewers and fire protection.

BURNET, TEX.—It is the intention of the city to erect water-works. Address A. R. Johnson.

WICKFORD, R. I.—The Water Company will build works.

WAKEFIELD, R. I.—The Water Company will build works.

WORCESTER, MASS.—The superintendent of Sewers will arch Mill Brook sewer, at a cost of \$22,000.

MEMPHIS, TENN.—Mr. W. L. Cameron, Secretary of the Water Works Company, has closed a contract for a Worthington steam-pump and connections for \$25,000, and two miles of 36-inch pipe, with Dennis Long & Co., of Louisville.

JANESVILLE, WIS.—The contract for laying the water-pipe has been awarded to Carroll E. Gray, of Chicago, for the stand-pipe to Tippetts & Wood, of Phillipsburg, N. J. The stand-pipe will be 25 by 85 feet. J. F. Williams is engineer in charge.

SILVERTON, COL., will buy the water-works.

SYRACUSE, N. Y. Common Council, on June 27, granted a franchise to the Salmon River and Onondaga Water Company, which proposes to build water-works, costing \$4,000,000.

SUMTER, S. C.—The contract recently made with Northern parties for constructing water-works has fallen through. New proposals will at once be advertised for.

WALLA WALLA.—The Water-Works Company will let contracts for building the works.

WATER-WORKS.—The following cities and towns are discussing water-works: Waldo, Me.; Benton Harbor, Mich.; Skaneateles, N. Y.; Colorado City, Col.; Butler, Mo.

NEWPORT, ARK., has accepted the water-works just finished, and will take 55 hydrants and plugs at a rental of \$2,500 yearly.

FERNANDINA, FLA., wants a system of water-works.

JOLIET, ILL.—Our correspondent writes: "There is a system of water-works in this city owned and managed by a private corporation. They contemplate rebuilding and making changes in said works. Information can be obtained by addressing the Secretary of the Joliet Water-Works Co."

MOORESTOWN, N. J.—The Water Company has organized, and elected the following officers: President, Dr. N. Newlin Stokes; Vice-President, J. E. Watkins; Treasurer, James C. Hopkins; Secretary, Samuel K. Robbins, Esq. Directors, Harry W. Doughten, W. N. Bannard, C. S. Sims, and the officers.

MACON, GEO.—There is talk of organizing a new water company. A contract has been made with the existing company to furnish 150 hydrants at \$50 each annually.

VAN BUREN, ARK.—The city has contracted for water-works.

LEWISTON, ILL., will have water-works.

WATER-WORKS are proposed for Herington, Kan.

BIRD CITY, KAN., will build water-works.

GLENWOOD, COL.—The town has accepted the proposition of S. J. de Lan to build water-works and furnish water. The town is to take 75 hydrants at \$50 per annum, payable quarterly, and \$30 annually for each additional hydrant. The source of supply will be either mountain springs or wells.

WARREN, MASS.—The residents of Beacon Street propose to build a reservoir on Fairbanks Hill, at the head of the street, and bring water to all the houses on the street.

MILWAUKEE, WIS.—A large brick sewer will be built in Fourth Avenue, from Washington Street to the intersecting sewer.

GLOVERSVILLE, N. Y.—The town has decided to spend \$5,000 on the construction of new sewers. The vote by which this was decided on empowers the corporation to expend \$15,000 upon the entire work.

ALTOONA, PA.—The city proposes to finish the Kittingan Point Reservoir and lay a 16-inch iron main to the city.

RED CLOUD, NEB.—Address H. Pond, City Clerk, about proposals for water-works here.

SANDFORD, FLA.—S. McLain has the contract for constructing works for the Water-Works Company.

CATONSVILLE, MD.—Mr. Joseph Cone has completed wells for water-supply and mains will be laid.

CHIFFEWA FALLS, MINN.—The Chicago, Milwaukee and St. Paul Railroad Company is building a dam on the Wisconsin River at a cost of \$200,000. The pond so formed will cover 11,000 acres.

MANCHESTER, TENN.—A correspondent writes: "There have been no steps taken as regards water-works at this place as yet, although they have been somewhat talked of."

PORTLAND, ME.—The Diamond Island Water Company, of Portland, has been incorporated; capital stock, \$5,000. Franklin M. Lawrence, incorporator.

BOSTON.—The Aldermanic Committee on Water reports favoring a connection with the water-system of Charleston, under appropriation of \$115,000 to meet the expense.

AMERICUS, GEO.—Ellis and Slocum, of Montgomery, Ala., are contractors for water-works here.

ALBANY, N. Y.—Surveys are in progress for the Martinville sewer. It will cost \$100,000.

LOS ANGELES, CAL.—The Sewer Committee wants to build a lot of pipe sewers. The City Engineer will advertise for pipe.

GRAND RAPIDS.—The specification for water-works at the Soldiers' Home have been completed, and bids will be asked for.

SANTA ROSA, CAL., wants a better water-supply.

OAKLAND, CAL., is considering the question of filtering its water-supply. Address the Contra Costa Water Company.

HELENA, MONT.—George F. Woodston will begin work at once on the water-works.

MERIDIAN, MISS.—The city authorities accepted June 23 the water-works as tendered by the Meridian Water-Works Company.

CHICAGO Aldermen are now deliberating on the proposed water-works tunnel, favored by Engineer Artingstall and the Mayor.

ALBANY, N. Y.—The Water Commission has entered into a contract with Andrews Bros., to furnish water from driven-wells. The contractor agrees that in the test which is to be continued for one year after completion of the work, the yield shall be 10,000,000 gallons daily. If the quantity falls below this the commission may reject the plant or accept at a price less than the contract price proportional to the diminished quantity of water. If the test for quality fails, the commission shall reject the plant. The price is \$237,500.

HAMILTON, ONT.—The Sewer Committee asks for \$10,000 for new sewers.

WALLA WALLA, WASH. T.—The city is discussing a sewerage system.

OMAHA, NEB. (Special). Water-Works Company will expend \$800,000 on extensions this year.

NEBRASKA CITY, NEB. (Special). is having grade and sewerage plans prepared by Rosewater, Christie & Lowe, of Omaha.

SEYMOUR PARK, NEB. (Special).—This place is having plans for sewers made by Rosewater, Christie & Lowe, of Omaha. Water-works and electric lighting will also be introduced.

ELMIRA, N. Y.—The special election held June 27 on the question of bonding the city for sewers resulted in a negative. The total number of votes cast was 909, of which 113 were for the proposed measure and 796 were against it.

LOWELL, MASS.—Both branches of City Council have authorized the borrowing of \$50,000 for the construction of sewers.

AUSTIN, MINN.—The town has voted water-works, embracing a system of wells for drinking purposes and river connection for fires. Estimated cost from \$25,000 to \$40,000.

WICHITA, KAN. (Special).—A sewerage system is being designed by Rosewater, Christie & Lowe, of Omaha, Neb.

BEATRICE, NEB. (Special).—Rosewater, Christie & Lowe have made grade plans and sewerage plans for this place.

PLATTSBROUGH, NEB. (Special).—Grade and sewerage plans are being designed by Rosewater, Christie & Lowe, of Omaha, Neb.

LEBANON, PA.—Mr. Harvey Tyron, a civil engineer, of Reading, Pa., has been employed to superintend the construction of a water-plant at McLaughlin's Dam.

RIVERSIDE, CAL.—The Riverside Improvement Company on June 14 awarded the contract for the construction of the Riverside water-mains and lateral piping over the Roubidoux tract to Lacy & Hooker, of Los Angeles at \$100,000.

The bids opened by the city trustees for lateral sewers in Sewer District No. 1, were all rejected. New bids were advertised for.

GAS, STEAM, BUILDINGS, ETC.

BIRMINGHAM, ALA.—A company of Philadelphians will sink gas-wells and establish works.

PORT HURON, MICH.—The St. Clair Light and Fuel Company, of this place, will sink gas wells at once.

SAN FRANCISCO, CAL.—The Natural Gas and Development Company has filed articles of incorporation. The directors for the first year are: J. B. Southard, F. W. Bean, David McClure, Philip I. Weaver, James Lawler, and A. Pierce, of San Francisco, and John P. Jones, of Gold Hill, Nevada.

TOLEDO, O.—The Lucas County Natural Gas and Oil Company is incorporated.

TOLEDO, O.—Our correspondent writes: "The contest over the proposed schedule of natural gas, as filed by the Toledo Natural Gas Company, and another and much lower one, offered in the City Council, has come to an end by the whole matter being tabled by the Council. It is thought that both the gas companies, which have extensive systems of pipes throughout the city, can now go on with their (experimental) service without further interruption. It is claimed that the charges for manufacturing and ordinary heating purposes are lower than the average of towns and cities where pipe lines have been introduced."

GREENSBURG, PA.—Wilson McCandles, President of the Allegheny National Bank, and others, have formed a company to sink wells, etc., in the Murraysville gas belt.

GAS COMPANIES.—Incorporated are the Kanabakee, Ill. Natural Gas Company; David H. Paddock and others incorporators.

The Peabody, Kan., Gas and Electric-Light Company; Thomas Osborne and others incorporators.

The Arkansas City, Kan., Natural Gas and Coal Company; A. G. Lowe and others incorporators.

The Hector Oil and Natural Gas Company, Monroe, Mich.; H. Saunders and others incorporators.

WEST TROY, N. Y.—The village president will enter into a contract with the West Troy Gas-Light Company to light the village for the ensuing year.

CAMDEN, N. J.—The Camden Gas Light Company has been awarded the contract for the ensuing year for the lighting of the public lamps at \$25 per lamp, and the Wheeler Reflector Light Company, of New York, has received the contract for the oil-lamps at \$20 each.

DENVER, COL.—J. J. Thomas & Co. will sink natural-gas wells near this city.

INDEPENDENCE, KAN.—A fund has been raised by the city to prospect for natural-gas.

EMPORIA, KAN.—The Gas, Oil, and Mining Company will sink gas-wells at once. Address I. E. Perley.

CINCINNATI, O.—The North Side Natural-Gas and Oil Company (Albert Williamson, President) is asking the city for a franchise permitting the company to open the streets, lay mains, and furnish natural-gas.

BROOKLYN.—President Quintard, of the Kings County Board of Supervisors, has vetoed the award of contract to P. J. Carlin for constructing the buildings at St. Johnland County Farm. Following this, on June 29, the Commissioner of Charities and Correction adopted a resolution withdrawing the plans from the Board of Supervisors, in accordance of which the plans have been returned and the contract is off.

SYRACUSE, N. Y. Common Council has authorized the Mayor to make a three years' contract with the Syracuse Electric-Light Company to furnish 147 additional lights at \$12 per month each. The lamp is Thomson-Houston make.

SAN FRANCISCO, CAL.—The Rae Electric-System Company have filed articles of incorporation in the County Clerk's office. Julius Jacobs, A. P. Brayton, Julio Rae, George C. Perkins, and William Alvord are the directors, representing \$1,000,000 capital stock, all of which is subscribed.

MARINETTE, WIS.—A gas company is applying for a franchise.

NEWPORT, O.—George W. Wilshire has applied for authority to lay pipes and furnish natural-gas for fuel.

CAMDEN, N. J.—The Philadelphia Lightning Company have filed articles at Camden of incorporation, with an authorized capital of \$3,000,000.

NEWPORT, O.—Judge McKibben has applied to City Council for a franchise permitting a company to erect poles and furnish electric-lighting.

MACON, GEO.—A new gas company is organizing here.

DETROIT, MICH.—The Board of Aldermen has voted in favor of making a contract with the Brush Electric-Light Company for lighting the streets for three years, at \$124,500 per annum, and \$100 per annum for each extra light.

MARION, IND.—Leonard Best & Co., of Buffalo, N. Y., have bought the Luma gas well at Fairmont, and will lay gas-mains to supply neighboring towns.

CIRCLEVILLE, O.—The Citizens' Natural-Gas and Mineral Company of this place is incorporated.

TOLEDO, O.—Two more natural-gas companies are applying for authority to lay mains and furnish the gas. They are the Black Swamp Natural-Gas and Oil Company and the Ohio Natural-Gas and Oil Company. The incorporators of the former are S. C. Schenck, D. Coghlin, G. M. Acklin, J. F. Kumler, and E. S. Dodd, and of the latter, H. S. Walbridge, D. Coghlin, S. C. Reynolds, A. L. Backus, W. Peter, C. F. Curtis, and J. K. Secor.

SPRINGFIELD, ILL.—Incorporated is the Galesburg Improvement Company, to prospect for natural gas, etc.

LYNN, IND.—Natural-gas wells will be sunk at once.

RAILROADS, BRIDGES, CANALS.

BRIDGE.—Governor Hill has signed the bill extending the time of completion of the Hudson River bridge at Poughkeepsie from January 1, 1888, to January 1, 1889.

MARINETTE, WIS. City Council has decided to build a bridge over the Menomonee River.

LOS ANGELES, CAL.—A viaduct for the railway tracks will be built.

LOS ANGELES, CAL.—The Mateo Street and Santa Fe Avenue Street Car Company has been incorporated. The object is to construct and operate a street-car line. The directors are: A. C. Hiscok, Charles A. Smith, H. M. Ames, S. D. Northcutt, J. O. Lotspeich, S. P. Rees, and M. L. Wicks. Capital stock, \$12,000; all subscribed.

RIVERSIDE, CAL.—The Riverside and Arlington Electric Railway Company has been incorporated at Riverside, with a capital stock of \$500,000, to build twelve and one-half miles of road in one line, and additional branches as they are needed. The Board of Directors chosen are Matthew Gage, S. C. Evans, James Bettner, A. S. White, Thomas Bakewell, W. J. J. Jarvis, and G. O. Newman.

SEATTLE, WASH. TER.—The Seattle Cable Road and Water Company has been incorporated by J. K. Murphy, C. P. Dam, and C. Coppin; capital stock, \$150,000.

LOS ANGELES, CAL.—The Alhambra and Ramona Street Railway Company has been incorporated at Los Angeles by A. Phillips, A. C. Weeks, J. De Barth Shorb, E. L. Watkins, H. W. Stanton; capital stock, \$100,000.

ALBANY, N. Y.—The New York, Chicago, and St. Louis Railway, to run from Buffalo to the Chautauqua border, a distance of seventy miles, has been incorporated, with \$4,500,000 capital. William K. Vanderbilt is a stockholder.

FORT PLAIN, N. Y.—The Fort Plain and Richfield Springs Railroad line is being surveyed.

PALATKA, FLA.—The St. Johns and Halifax, and St. Augustine and Palatka Railway managers, together with those of the J. T. & K. W., have decided to bridge the river at Palatka. Major McGlaughlin and President White were in the city June 23, when this was decided upon.

WINNIPEG.—Address Premier John Norquay about the extension of the railroad from the Northern Pacific to Winnipeg.

MACON, GEO.—The Macon Construction Company (W. B. Sparks, President, J. Lane, General Manager), has awarded the contracts for the construction of the Georgia Southern and Florida Railroad as follows: Grading to T. J. James & Bros., of Atlanta; cross-ties and trestling to Pitman, Baker & Co., of Thomasville. Prices are not made public.

DAVENPORT, IOWA.—The Bridge, Second Street and Northwestern Street Railway Company want bids for constructing and equipping the road. Address P. W. McManus.

CHICAGO.—Incorporated is the Equitable Transportation Company to build an elevated railroad from Blue Island to Chicago; William Cook, James Thompson, and Joseph Coolidge, incorporators.

SIOUX CITY, IOWA.—The Sioux City and Morning Side Railway Company is incorporated to build steel railways; William L. Joy, E. C. Peters, Edward Hankinson, J. O. Patterson and F. Pershing, incorporators.

PASADENA, CAL.—Mr. Yokum constructs about ten miles of railroad. The line will partially be operated by horse-power. A part will be cable-road, and the largest part will be a narrow-gauge steam railroad. A bridge of two large spans (deck) and several bents of trestle-work spans the Arroyo Seco, on a heavy grade, and at a height of sixty-five feet. The trusses are Pratt combination, fifteen feet apart and nearly thirty feet high. A corporation has been formed here, of which Col. Markham, Mr. Williams, Mr. Martin are members, to construct a rack railroad to Wilson's Peak, the highest point of the Sierra Madre Mountains, sheltering Pasadena towards the north. The road will be about five miles in length, traverse very rough country, and winds up to a height of 7,000 feet above sea. The Altadena Railroad, a standard gauge steam railroad (real estate enterprise), will lead to the foot of the hills, about seven miles off Pasadena, and join the mountain railroad. A capital of \$500,000 has been provided for. The Peak will be adorned with a hotel, and an astronomical observatory (perhaps), for which Mr. Spence, of Los Angeles, has donated \$50,000 to begin the subscription.

RAILROAD.—The Atchison, Topeka and Santa Fe Railway Engineers have been surveying over the line of the St. Louis and Chicago Railway from Peoria to Springfield and Litchfield, Ill.

SIOUX FALLS, DAK.—The Duluth line of the Manitoba Railroad will be extended to this place.

PATERSON, N. J.—The Street Committee has decided upon the streets on which \$30,000 shall be expended for macadam pavement.

FRAMINGHAM, MASS.—A Street Railroad Company has been formed here to build seven miles of railroad; capital, \$60,000.

BIG RAPIDS, MICH., has voted to spend \$15,000 on an iron bridge.

BLOCK ISLAND, R. I.—No bids were received for cutting a channel from Salt Pond to the Ocean. New specifications have been prepared by Town Council, and bids will be received until July 5.

ST. JOSEPH, MICH.—On July 2 the town will vote on the question of raising \$15,000 for an iron bridge across the river.

DOUGHERTY COUNTY, GEO., has voted to raise \$20,000 to pay for a bridge.

RAILROAD.—A company has been chartered with a capital stock of \$1,000,000 to build an elevated railway from Blue Island to Chicago.

SAULT STE. MARIE will have a street railway.

RAILROAD.—An organization has been made under a charter granted by the Kentucky Legislature three years ago, incorporating the Louisville, Cincinnati and Virginia Railroad Company. The line of the proposed road starts from Winchester, Ky., where it connects with the Kentucky Central and Elizabethtown, Lexington and Big Sandy Roads, proceeds to the Three Forks of the Kentucky River and thence passes through the coal fields of south-eastern Kentucky to a point on the Virginia line, where it connects with the Norfolk and Western Railroad. Among the directors are Messrs. Douglas Green, J. L. Robertson, and F. K. Hain, of New York City; ex-Senator J. S. Williams, A. W. Hamilton, and T. G. Stuart, of Kentucky, and W. D. Hill and C. T. Hunt, of Birmingham, Ala.

WASHINGTON, D. C.—The report of the Board of Engineer Officers, consisting of Colonel J. M. Wilson, Lieut.-Col. P. C. Hains, and Major G. J. Lydecker, appointed to consider the subject of the construction of a bridge across Eastern Branch, at the foot of Pennsylvania Avenue, was laid before the Secretary of War, June 22. The location of the proposed bridge recommended by Lieut.-Col. Hains, in his report to the Chief of Engineers, May 31, 1887, is approved by the board. The bridge will be 1,705 feet long between high-water lines, with approaches about 530 feet long, making the total length of bridge and approaches about 2,235 feet. The board recommends that advertisement for plans and prices of a bridge that shall conform to the general requirements indicated above be now prepared and published, as required by the act approved February 23, 1887.

ROXBURY, KAN.—The Gypsum Valley Railroad Company is incorporated by Jarvis P. Tolles and others.

ATTICA, KAN.—The Newtown, Alton and El Paso Railroad is incorporated; W. E. Campbell and others.

PONTIAC, ILL.—Incorporated is the Pontiac Street Railroad Company; Peason M. George, incorporator.

MACON, GEO.—Pittman & Baker, of Thomasville, have contracted to build bridges and trestles, and furnish cross-ties for the Georgia Southern and Florida Railroad.

RAILROAD.—The Clay Centre, Minneapolis, Kanopolis and Western Railroad Company, Minneapolis, Minn.; John Triplett and others, incorporators.

MILWAUKEE, WIS.—City Engineer Benzenberg has submitted plans and specifications for a viaduct across the Menomonee Valley in line with Eleventh Avenue and Sixteenth Street, from Pierce Street in the Eighth Ward to Clybourn Street in the Sixth Ward. The plans contemplate an approach on each side retained by stone abutments of 144-foot iron drawspans, and of 3,735 feet of iron trestle bridge on stone piers, resting upon pile foundations. The spans vary from 30 to 45 feet, and consist of heavy plate girders. The roadway is to be not less than 37 feet above city datum, 30 feet wide, and laid with cedar block pavement, with asphalt-cement filling. The sidewalks are to be 9 feet wide in the clear. The estimated cost, including right of way across the valley is estimated at \$495,700.

MINNEAPOLIS, MINN.—The Belt Line and Transfer Company has been incorporated to construct terminal lines in St. Paul and Minneapolis by W. D. Washburn, C. J. Blethen, and others.

PITTSBURG, PA.—The Pittsburg and Western Railroad will make extensions of its line, building about 110 miles of new track.

TOPEKA, KAN.—The City Clerk has been directed to advertise for proposals for paving certain streets with asphalt.

PITTSBURG, PA.—A company is being organized in this city for the purpose of selling rights for electric railway purposes. It is to be called the Overhead Conductor Electric Railway Company, and has a capital stock of \$400,000. Among those interested in it are George Westinghouse, Jr., John Caldwell, H. H. Westinghouse, Frank L. Pope, and Thomas B. Kerr.

RAILROAD.—The Springfield, O., and Western Railroad Company has been incorporated at Columbus, O.; capital, \$500,000.

OMAHA, NEB.—The Metropolitan Cable Road will be begun at once. R. Gilman is Consulting Engineer.

COOPERSTOWN, N. Y.—Articles of incorporation of the Mohawk and Susquehanna Valley Railway Co. were filed with the Secretary of State June 29. This is the long-talked-of scheme. The length of the proposed road is forty-five miles. It will run through or into the counties of Montgomery, Herkimer, and Otsego. The directors are: Sidney Dillon, George Foster Peabody, Arthur W. Soper, Edward M. Bulkley, J. D. Davidson, W. A. Barbour, W. R. Thomas, J. B. Skehan, Joseph Williams, and A. P. D. Hender, New York City; Edwin Packard, Brooklyn; W. J. Arkell, Canajoharie, and J. K. Hitchcock, Orange, N. J.

ERIE, PA.—The Barber Paving Company has estimated the cost of paving West Fifth Street at \$11,000. The work will be done.

ST. JOSEPH, MO.—The Wyatt Park Railway Company of this city is incorporated to build a cable-road.

SANTA FE, N. M.—The New Mexico Central Railroad Company was organized June 23, with Judge Henry L. Waldo, of Santa Fe, President, W. H. Rosington, of Topeka, Vice-President, F. W. Wilder, of Topeka, Secretary and Treasurer, W. W. Griffin, of Santa Fe, Assistant Secretary, C. L. Goodwin, of Boston, Assistant Treasurer, A. A. Robinson, of Topeka, Chief-Engineer, and J. P. Whitehead, of Boston, Comptroller and General Auditor.

The Rio Grande Land Company was also organized with W. H. Waldo, President, A. H. Johnson, of Topeka, Vice-President, E. W. Wilder, Secretary and Treasurer, W. H. Griffin, Assistant Secretary, and J. K. Livingston, of Santa Fe, General Agent. The company was formed to assist in developing New Mexico, particularly the Rio Grande Valley. The headquarters are at Santa Fe.

BIDS OPENED.

MILWAUKEE, WIS.—R. J. Finn secured the contract for laying house drains on Mitchell Street at 60c. per lineal foot, and will receive \$1.09 per lineal foot for laying water-mains on the short side and 67c. per lineal foot for the short side. The sewers are generally in the centre of the street and the water-pipes on the east and north sides of the street.

STILLWATER, MINN.—Bids for a 30-cell solitary were opened June 20 by H. G. Stordock, Warden, and the contract was awarded to F. H. Lemon & Co., of Stillwater, at \$19,856.

MILWAUKEE, WIS.—The contracts for the new St. Rosa's Orphan Asylum were let by the architects, E. T. Mix & Co., June 22, as follows: Mason work, Charles Kraatz; carpenter work, Ellis & Coogan; cut stone, J. L. Cox; painting, Robert Harper & Sons. The cost of the building will be about \$40,000.

DE PEPE, WIS.—The Street Committee on June 16 opened the bids for furnishing the city with sewer-pipe. The contract was awarded to P. S. Loy at 56½ per cent. off union prices. Winegard & Persons Co.'s bid was 55 and a Milwaukee firm's 53 per cent. off.

MEMPHIS, TENN.—J. A. Bailey & Co. have the contract at \$4,000 for plumbing of the new Lowenstein building, costing nearly \$200,000.

YOUNGSTOWN, O.—On June 22 the City Clerk opened bids for furnishing and laying 13,000 square yards of vitrified fire clay pavement: Evan J. Davis and David Gore, of Youngstown, bid on excavation, 45c. per cubic yard, total, \$3,084.75; on agricultural tile, 4c. per lineal foot, total, \$50; on setting curb, 10c. per lineal foot, total, \$524.20; on furnishing and setting curb, 30c. per lineal foot, total, \$609.30; on foundation, furnace slag, 40c. per square yard, total, \$5,300; on furnishing brick and paving, \$1.45 per square yard, total, \$18,850; grand total, \$28,389.25.

George Welsh, on furnishing curb, bid 32½c. per lineal foot.

NEW HAVEN, CONN.—Bids for the construction of the almshouse at Springdale Farm (plans by Allen & Tyler) were opened June 23. We give the more important ones:

Masonry: Bates & Townsend, \$106,570; George A. Baldwin & Son, \$111,343; George M. Grant, \$105,640; J. N. Leonard & Co., \$112,040; E. H. Sperry, \$103,962; Tracy Bros., —; P. Maher, \$120,478.

Carpentering: Tracy Bros. (including painting), \$63,000; N. Countryman, \$62,000; Charles D. Loveland, \$58,670; Larkins & Langley, \$57,147; W. A. Lincoln, \$61,000; David H. Clark, \$57,063.

Iron stairs: Bates & Townsend, \$5,775; George A. Baldwin & Son, \$6,275; George M. Grant, \$6,300; J. N. Leonard & Co., \$5,350; E. H. Sperry, \$5,775; Tracy Bros., \$4,200; P. Maher, \$5,500.

Steam heating: H. B. Smith & Co., \$15,250; New Haven Steam Heating Co., \$14,980.

NEW YORK CITY.—The following bid was opened June 29 by the Board of Education for steam-heating in school house as follows: P. Carraher, \$793.

LAWRENCE, MASS.—The special committee on rebuilding the burnt Union Street bridge has opened bids for constructing a five-span bridge—Boston Bridge Company, \$39,790, to finish it between January 1 and 15; Niagara Bridge Company, \$37,300, to finish it between December 1 and 15; Rochester Bridge Company, \$35,000, to complete it by December 1.

At a meeting of both branches of the City Council it was voted to immediately rebuild the temporary bridge washed away June 18, and to give authority to the joint committee to so rebuild it.

JERSEY CITY, N. J.—The following bids for furnishing 900 lengths of 6-inch, 60 lengths of 8-inch, 40 lengths of 10-inch cast-iron pipe, were received by John Watt, Esq., June 27:

R. D. Wood & Co., Philadelphia, delivered at Morgan Street dock, 6-inch, \$37.80 per ton; 8-inch, \$37.80; 10-inch, \$37.30; at Communipaw Station of the New Jersey Central Railroad, 6-inch, \$37.80 per ton; 8-inch, \$37.80; 10-inch, \$37.30.

M. J. Drummond, New York City, \$37, \$37, \$37, and \$37, \$37, respectively.

John Fox, New York City, \$36, \$36, \$35.50, and \$35.50, \$35.50, respectively.

J. J. McKenna, New York City, \$36.40, \$36.40, \$36.40, and \$35.90, \$35.90, \$35.90, respectively.

ALBANY, N. Y.—The contracts for lengthening 13 of the 16 locks on the Erie Canal have been awarded as follows: Lock No. 32 to Soule & Raynor for \$23,991.50; Lock No. 33 to Soule & Raynor for \$26,200; Lock No. 31 to Clinton Beckwith for \$21,070; Lock No. 46 to Faas & Ford for \$15,117.50; Lock No. 62 to B. P. Smith for \$26,509.20; Lock No. 44 to Daniel Ford for \$28,114; Lock No. 45 to John Moor for \$28,403.75; Lock No. 53 to John Moor for \$22,276.50; Lock No. 55 to John Moor for \$34,986; Lock No. 46 to John Moor for \$28,502; Lock No. 57 to Hughes Brothers for \$25,895.50; Lock No. 61 to Hughes Brothers for \$26,175. The appropriation for the work was \$375,000, and the total amount of the bids is \$331,089.75. The bids for Locks Nos. 34 and 35 were thrown out because there was but one bid on each.

Proposals for enlarging Locks Nos. 34, 35, and 75, Erie Canal, together with two for Champlain Canal, are asked for.

ROCHESTER, N. Y.—The contract for building a factory to cost \$35,000 has been awarded to Messrs. Ellsworth and Grant.

KANSAS CITY, MO.—A building is to be erected for the Goodin Exposition Company to cost \$350,000.

THOMASVILLE, GEO.—The contract for the bridging of the South Florida and Georgia Railroad has been awarded to Messrs. Baker and Pittman of this city.

DETROIT, MICH.—The contract to erect a building to cost \$28,000 has been awarded to Messrs. Tappan and Fisher.

STILLWATER, MINN.—The contract for building the jail has been awarded to Messrs. F. H. Lemon & Co., cost, \$19,850.

GOVERNMENT WORK.

SYNOPSIS of bids for hydraulic passenger elevator for Custom-House, etc., at Buffalo, N. Y., opened June 27 by the Supervising Architect of the Treasury Department: Crane, Elevator Co., \$3,500; Howard Iron Works, \$5,327; Elias Brewer, \$5,995; George C. Howard, \$8,000; George C. Howard (no cistern or pump), \$7,700; Ellithorpe Air-Brake Co., \$6,500.

WASHINGTON, D. C.—The Bureau of Yards and Docks opened bids June 29 for two timber dry-docks complete, with iron caissons, boilers, engines, etc. The docks are to be from 480 to 500 feet long and 125 feet wide between copings, 40 feet wide on floor, 25 feet 6 inches depth on sill, 80 feet wide at entrance. The docks are to be located one at Norfolk, Va., one at Brooklyn. The bidders were:

J. E. Simpson & Co., New York City, for both docks, \$1,061,600.

O'Connell & Coffey, Brooklyn, N. Y., for New York timber dock, \$525,000.

DALLAS TEXAS.—Synopsis of bids for iron work for roof of Court-House, Post-Office, etc., opened June 28, 1887, by Supervising Architect, Treasury Department: Marshall Foundry and Construction Company, Pittsburg, Pa., \$7,025.69; Missouri Valley Bridge and Iron Works, Leavenworth, Kan., \$9,100.

SYNOPSIS of bids, opened June 27, by the Light-House Board, for furnishing and delivering two second-order lanterns, one for Moose Peck, Me., and the other for Lembyat Head, Mass., Light Station: The Allentown Rolling Mills, Allentown, Pa., \$5,577.60; Robt. Daly & Co., New York City, \$7,600; The Portland Company, Portland, Me., \$7,800; H. A. Ramsay & Son, Baltimore, Md., \$7,942; The Colwell Iron Works, New York City, \$9,375.

Contract awarded to the Allentown Rolling Mills.

SYNOPSIS of bids for steam heating for Court-House, etc., at Rutland, Vt., opened June 27, by Supervising Architect, Treasury Department: L. E. Milles, Salem, Mass., \$2,245; A. Calhoun, Middlebury, \$3,165; Edward T. Bates, \$2,700; Bartlett, Hayward & Co., Baltimore, Md., \$2,050; Walworth Manufacturing Company, \$2,387; New Haven Steam-Heating Company, \$2,800; Johnson & Morris, \$2,830; Lee, Chamberlain & Co., Troy, N. Y., \$2,800; Baker, Smith & Co., New York, \$3,272; Pierce, Butler & Pierce Manufacturing Company, \$2,576.

SYNOPSIS of bids for labor and material for the carpentry work, etc., required to enclose the Court-House, etc., at Macon, Geo., opened June 28, 1887, by Supervising Architect Treasury Department: Hendrix & Willingham, Macon, Geo., \$9,600; John Mitchell, Louisville, Ky., \$6,945; Harris & Co., Newport, Ky., \$6,327.

MISCELLANEOUS.

TROY, N. Y.—The Watervliet Arsenal Works will be rebuilt for the manufacture of heavy ordnance.

JACKSON, TENN.—At a city election, June 14, to decide on the issuing of bonds for \$34,000 to provide for the erection of a stand-pipe, the proposition was defeated.

A **SCHEME** is on foot, said to be engineered by substantial backers, which has for its object the formation of a through line via the Poughkeepsie bridge, between the coal regions of Pennsylvania and the manufacturing centers of New England. The uncompleted Pennsylvania, Slatton and New England is to form the western end of the new line, while the Hartford and Connecticut Western is said to be controlled in the same interest, and by the construction of a number of short branches or the formation of alliances, will give connections with a number of important New England points.

The Town Board of Patchogue, L. I., has established a new system of water-supply by tapping Second Lake and laying iron pipes through the village.

BROOKLYN.—The Executive Committee of the consolidated Brooklyn Union Elevated Railroad Companies has closed a contract with the Rhode Island Locomotive Works, of Providence, for forty-five improved locomotives, making, with six now under way, fifty-one motors to be used on the lines of the corporation. The first batch will be ready for delivery by January 1, and the entire number by the 1st of next May. The engines are to be a heavier model than now in use on the Brooklyn line, and embrace the latest improvements in light locomotive building.

A contract has also been made with the Gilbert Manufacturing Company, of Troy, for 150 new passenger cars to make up the needful trains. The first thirty of these are to be delivered in December.

SANTA CRUZ, CAL., has voted to spend \$80,000 on various city improvements.

CHICAGO.—A bill passed the State Legislature providing for the building of a sea wall for Lincoln Park, at a cost of \$300,000. Address Mr. Goudy, President of the Lincoln Park Board.

FREERPORT, ILL.—Surveys have been made for the Freeport, Dodgeville, and Northern Railroad.

BUILDING INTELLIGENCE.

PEABODY, KAN.—A 3-story hotel will be built here.

LYONS, KAN.—An opera-house will be built here.

FOND-DU-LAC, WIS.—In progress, St. Joseph's Church, corner of Marr and Second Streets.

NEW YORK CITY.—The Madison Square Garden Company will make extensive improvements in the property, which they have just bought.

WINONA, MINN.—The shops of the Winona and South-western Railroad will be built here.

WINCHESTER, CONN.—A \$10,000 court-house will be built.

MINNEAPOLIS, MINN.—Ridgewood av, bet Lyndale and Lyndley avs, fr dwell: cost, \$7,000; o, W. W. Bayles.

Cor Hawthorne av and 16th st, fr dwell: cost, \$7,000; o, E. C. Cauvet.

24th st, bet 28th and 29th avs, br school bldg: cost, \$23,951; o, Board of Education; a, Long & Kees, b, H. E. Selden.

8th av, n, bet Hoag and Bradford, br dwell: cost, \$10,000; o, C. A. Anderson.

42d, and Minnehaha av, fr dwell: cost, \$8,000; o, W. R. Moffatt.

Lake of Isles Boulevard, fr dwell: cost, \$7,000; o, W. P. Douglas.

4th st, br horse house: cost, \$9,000; o, City of Minneapolis.

BUILDING INTELLIGENCE.

(Continued from page 116.)

CINCINNATI, O.—A factory costing \$20,000 will be built by the Sagendorph Iron Roofing Co.

SAVANNAH, GEO., is to have a new hotel. For further information address J. A. Wood, 76 Chambers St., N. Y. City.

SAN FRANCISCO, CAL.—A new church costing \$100,000 is to be built for the Unitarians.

PROVIDENCE, R. I., is to have a new opera house. For further information address Col. Francis L. O'Reilly.

SAN FRANCISCO, CAL., is to have a cathedral costing about \$200,000.

DETROIT, MICH.—The Chapoton Bldg Co. have been awarded the contract for a building to cost \$45,000.

KANSAS CITY.—42 bldgs costing less than \$7,000.

ROCHESTER, N. Y.—The State Industrial Home Association will erect a building to cost \$110,000.

PUEBLO, COL.—The Denver, Texas and Gulf R. R. will build a passenger and freight depot at this place to cost \$20,000. For further information address B. N. Grove, Superintendent, Denver.

WASHINGTON, D. C.—A building to cost \$1,000,000 will be erected in this city by Mr. Levi P. Morton.

PITTSFIELD, MASS., is to have a new Episcopal Church, costing \$50,000.

PEORIA, ILL.—A Druid Temple will be erected in this city at a probable cost of \$20,000.

CINCINNATI, O.—New works, costing \$85,000, will be erected by Messrs. L. Schrieber & Sons.

YOUNGSTOWN, O.—Architects Kanengeiser & Kling have prepared plans for the new Catholic church at Niles, O., to cost \$12,500. The same firm are also preparing plans for the residence of C. E. Tillotson, Greenville, Pa., to cost \$7,000.

WINCHESTER, MASS.—In progress, town hall.

BRISTOL, TENN.—John H. Ingham, of New York City, can give information about an extensive improvement scheme here, including furnaces and factories.

SHREVEPORT, LA.—A hospital will be built here to cost \$12,000. L. A. Parisher is the contractor.

CROWLEY, LA.—The contract to build the court-house has been let to Hannan & Voss, of Baton Rouge, at \$11,000.

DONALDSONVILLE, LA.—The police jury will receive bids for building a court-house.

LEXINGTON, KY.—Belknap & Dumesnil, of Louisville, have the contract for building the court-house here, at \$31,000.

BOSTON.—The Department for the Survey and Inspection of Buildings have, during the past week, issued permits for about eighteen wooden tenement houses and stables, the average cost of which will be about \$2,000.

The Sewall & Day Cordage Company has made arrangements to remove its extensive works from the Roxbury District to the Brighton District, at which latter point about thirty acres of land have been purchased on Western avenue, near Everett street. The company will at once begin the erection of two buildings, one of which is to be of brick and stone, 88x118, two stories in height, with a flat roof, and the other 81x95, one story in height, with flat roof; the rope-walks are to be 1,738 feet in length, with a width varying from 28 to 42; and a planing mill of wood is to be 96x40. Cutting & Bishop of Worcester, are the architects.

OAKLAND, CAL.—Address the Christian Brothers about the new buildings to be erected on Broadway, at a cost of \$25,000.

CHICAGO, ILL.—1264-70 W Lake, br at flats, cost, \$28,000; o, James L. Campbell; a, C. A. Weary; b, owner.

190 Cass, br flats; cost, \$7,100; o, Jas Sullivan; a, Geo G. Spohr; b, Jno Woodstrom.

711 N Harriet, br flats; cost, \$10,000; o, Augt Kirchhoff; a, Ruger & Snorr; b, Jno P. Flick.

2310 Portland av, br flats; cost, \$7,100; o, Anton Martin; a, J. P. & J. F. Doerr; b, Lash & Williams.

417-19 Centre, br dwell and addn; cost, \$9,000; o, H. Forrest; a, Schaub & Berlin; b, Jos Hodgson.

77-89 Washington, addn to office bldg; cost, \$75,000; o, U S Express; a, W W Boyington; b, Robinson & Miner.

934 Ashland av, br and at flats; cost, \$12,000; o, Aug Stude; a, H. Hildinger; b, H. Grosser.

147 Blackhawk, br st and flats; cost, \$8,000; o, M. Lunder; b, I. Stasiowski.

246-54 Franklin, br dwell; cost, \$30,000; o, Estate of Nathan Boddie; a, Fred Baumann; b, L. J. Dargling.

Michigan av, Wabash av and Congress, 10-story and bsmt at auditorium and hotel, 360x137 feet; cost, \$2,000,000; o, Chicago Auditorium Ass'n; a, Adler & Sullivan; b, Jno Angus.

3833-35 State, br st and flats; cost, \$7,100; o, J. W. Cochran; a, H. H. Boyington; b, J. J. Rogan.

LANCASTER, PA.—Address Rev. John F. Crouch, of the Duke Street Methodist Church, about a new edifice.

BIRMINGHAM, ALA.—Morris & Underwood are the owners of a \$25,000 building to be erected here; Belton Gilreath, contractor.

ELMHURST, ILL.—Frame and slate dwell, cost, some \$10,500; o, Mrs J R Case; a, C. H. Tilton.

GENEVA, ILL.—St and slate dwell, cost, \$12,000; o, Mr. Orton; a, Cleveland.

WORCESTER, MASS.—Nothing to report this week over \$7,000.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 6. } PUBLISHED EVERY SATURDAY.

NEW YORK, JULY 9, 1887.

LONDON, JULY 23, 1887.

SINGLE COPIES, TEN CENTS.
Subscription, \$4.00 per year in advance, post paid. } IN AMERICA
SINGLE COPIES, SIXPENCE.
Subscription, 20s. per annum in advance, post paid. } IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN.

92 & 94 FLEET ST., LONDON.

TERMS. 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed — & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

THE CONVENTION OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE convention at the Hotel Kaaterskill, now just closed, has been one of the most successful in all respects that was ever held, being made all the more so from the charming character of the resort selected for the meeting. There were some 300 members and guests, and all branches of the profession were ably represented.

The Committee of Arrangements had most thoroughly anticipated all the requirements of the occasion, and everything passed off without a hitch. Those who attend such gatherings are too often oblivious to the labors and pains taken by brother members for their comfort, and the latter are rewarded more by fault-finding than praise. We are glad to be able to say, however, that in the present case the committee were most pleasantly remembered.

There were some ably-sustained and important discussions, both written and oral, on a number of practical subjects, and a large number of very interesting and important papers and reports.

We shall present hereafter such portions of these as we think will interest our readers.

We do not think our remarks of last week convey the idea, as stated by a correspondent in another column, that "too much attention is paid to the social side" at these gatherings. We certainly had no such intention in what was written. If all the quiet talks on scientific subjects between members of the convention could be written out, it would be found that if nothing else had been accomplished, the professional gain would be great. But it is no slight gain to be able to throw off the shop and meet brother members socially with their wives and daughters, and learn that every man has another side to his character, perhaps unsuspected before, but which is only drawn out under such conditions. In other words, to see that engineers are citizens, fathers, brothers, husbands, as well as machines absorbed in their special work. There is very little danger that engineers will be carried away by the festivities of such an occasion; a week in their offices will quickly remove the poetry of the meeting. Let us hope that all will return to their work with renewed vigor, and all the better able to cope with it from the brief unbending of the professional bow.

LONDON WATER-SUPPLY.

THE report of Mr. A. de C. Scott, the Water Examiner under the Metropolis Water Act of 1871, made for the month of March, 1887, contains some interesting data. London is supplied with water by eight private companies, who furnished water to 722,263 houses during the month. The total daily average supply was 152,224,619 gallons, being about 28 gallons per head for an estimated population of 5,356,982. About half of this comes from the Thames, 37 per cent. from the Lee, and the remainder from springs, wells, and ponds. The number of houses receiving constant supply is 353,237, and 1,178 miles of streets contain mains constantly charged, in connection with which fire-hydrants are, or can be, fixed.

Seven of the companies have storage reservoirs, and carry out a process of filtration through sand and gravel. The subsiding and storage reservoirs for unfiltered water cover about 465 acres, and have an aggregate capacity of 1,290,100,000 gallons. There are 54 covered

reservoirs for storage of filtered water, having an aggregate capacity of 160,252,000 gallons. The results of the chemical and bacteriological examinations made during the month are reported as very satisfactory.

DRAINAGE INTO THE LOUISVILLE AND PORTLAND CANAL.

IN response to a resolution of the House of Representatives, at the recent session, asking for information as to the rights of the city of Louisville to drain into the canal, the Secretary of War transmitted a letter upon the subject. An examination of the laws of the State and the United States shows that the title was acquired by the general Government under a law of the State of Kentucky, approved February 22, 1854, but it was not until February 8, 1855, that full title was obtained, excepting five shares.

March 28, 1872, the State Legislature passed a resolution directing the president and directors to surrender the canal, and all property connected therewith, upon the condition, among others, "that the city of Louisville shall at all times have the right of drainage into the said canal; provided, that the connections between the drains and the canal shall be so made as to keep out mud and garbage."

The report by Major Stickney, U. S. Engineer, shows that this latter condition was never agreed to by the general Government; also, that the drainage from a number of sewers into the canal causes a very offensive and disagreeable state of affairs, as the sewage from nearly two square miles now takes this direction. It is only a question of time, therefore, when some change will be imperative. As the canal stops direct access to the Ohio River, the sewers must be carried underneath by syphons, or an intercepting-sewer parallel to the canal be built. The latter is recommended, and as, from the nature of the case, it is a hardship to the city, the recommendation is made that the Government bear a portion of the expense.

SANITARY CONDITION OF HEALTH RESORTS.

IN a paper on the sanitary police of watering places and health resorts in France, presented to the French Society of Public Health, Dr. Bouloumie explains briefly why it is that the present system of inspection and supervision of these plans, which in theory is quite elaborate and careful, amounts to nothing in practice.

The chief object of the local medical inspector or health officer at such a place is to get practice among the visitors, and to obtain this he needs the good will of the proprietor the hotel-keeper, etc., etc. He must be prepared at all times to certify to the excellence of the sanitary arrangements, to prove that the water is good, the sewerage superb, and that any alleged cases of typhoid are either not typhoid or have been contracted elsewhere.

It is, of course, quite different with the physicians of our own health resorts, but perhaps it will tend to keep them thoroughly conscientious and disinterested in their opinions if sufficient skepticism be maintained to demand additional evidence as to the healthfulness and sanitary condition of these places of public resort. We observe that even State Boards of Health are sometimes very reluctant to tell the truth to the public about the health resorts which are under their jurisdiction, so that it is no wonder that local health officers should lean—just a little.

OUR BRITISH CORRESPONDENCE.

New Reservoir for Lille—Cutting Down Expenses—Sanitary Registration of Buildings Bill—Edinburgh Library Architectural Competition—Transference of Rights of the Sheffield Water Company—Branch Association of Sanitary Inspectors of Liverpool.

LONDON, June 22, 1887.

A NEW reservoir for the water-works of Lille is in course of construction. It is a rectangular brick structure in two equal water-tight compartments, with a total capacity of 2,600,000 gallons. It has an 18-inch concrete floor and walls 15 feet 6 inches high at base, tapering to 5 feet 4 inches at top. A straight slope—the chord of the curve—has been adopted instead of curved walls, to correspond to the resistance required. The arched roof over the reservoir is built on independent pillars fifteen feet high, the object being to relieve the walls of extraneous strain.

pointed for the purpose) has just issued its report, and objects to the bill *in toto*, principally on the ground that there is no guarantee of the competency of these experts. Further, it points out that the bill proposes to license the existing incorporated sanitary associations, and that such license in sanitary practice would give any such association authority to give unchallengeable certificates of sanitary perfection. The report further points out that the bill has been promoted by a sanitary association, and that therefore it is not unfair to assume that the primary reason for its introduction is to be found in the desire to encourage such bodies.

A quibble which has been raised by the authorities in the Edinburgh Library architectural competition is more creditable to their ingenuity than to their sense of justice. Two out of the three premiums were assigned by Mr. Waterhouse to two gentlemen who were acting as assistants to principals, one of whom was Mr. Dunn, of the Borough Engineer's Office, and the other, Mr. Lumsdaine, of the Office of the Superintendent of Public

present time is £1,226,200 (\$5,887,360) of the former and £489,800 (\$2,351,040).

Credit is due to the promoters of the Association of Sanitary Inspectors for bringing the duties status of the Sanitary Inspector out of the unsatisfactory position they held towards the public generally. The sanitary inspectors of Liverpool and district, recognizing the fact that the meetings of the parent association have been of great value in disseminating information and affording mutual support, have decided on forming a branch association. Some of the members have in view the desirability of a superannuation scheme which is to be the result of cumulative payments. It is difficult to see how the inspectors, under the existing circumstances, could contribute to such a scheme, as their salaries in some country places range as low as £50 (\$224) per annum.

SAFETY-VALVE.

RESIDENCE AT YORK HARBOR, ME.—ANDREWS & JAKES, ARCHITECTS.

The Ventnor (Isle of Wight) Local Board is evidently an admirable body in its desire to cut down expenses and decrease the rates, but, unfortunately, these economical propensities are taking a very unwholesome direction. In addition to giving the general corporation employees three months' notice to leave and cutting down the wages by various sums, they have decided to suspend the flushing of the sewers. The clerk to the board is offered £20 less (\$96) per annum, the surveyor £50 (\$240), the sanitary engineer £14 (\$67.20), and the rate-collector £12 (\$57.60). The surveyor, who is an experienced official, has already found another engagement. Seeing that Ventnor, being in the Isle of Wight, is one of the leading health resorts, the board will probably have to "perpetrate" fresh economies in a year or so if they persist in the present method.

The National Health Society has taken very decided ground against the proposed Sanitary Registration of Buildings bill, the text of which has already appeared in the columns of THE SANITARY ENGINEER and CONSTRUCTION RECORD. The sub-committee of the society (ap-

Works. Objection is taken to the award on the ground that the recipients are not architects carrying on business in Edinburgh. The definition in this case is very fine, and requires a Scotch mind to comprehend thoroughly.

The Sheffield Corporation and the Directors of the Sheffield Water Company have come to an agreement as to the transference of the rights of the Water Company to the corporation. The terms are, I think, unusual. The transfer will be as from January 1, 1888. The corporation will take over the debenture debt, and will grant to the holders of preferential and ordinary shares, to the former 4 and 5 per cent. for every £100 share of the capital, and to the latter 2 per cent. for 1888 and 1889; thence to 1894 $\frac{1}{4}$ per cent. increase for two years, after which time the amount will be 4 per cent. Ordinary shares may have, at the holder's option, either a fixed annuity of £3 (\$14.40) for every £100 (\$480) or a compound of £82 (\$393.60) in cash. The Chairman and Manager will receive £3,000 (\$14,400) each as compensation. The dividends for the last five years have been at the rate of $2\frac{1}{2}$ per cent. per annum, and the total amount of shares and loans at the

OUR SPECIAL ILLUSTRATION.

NEW DORMITORY, M'CORMICK THEOLOGICAL SEMINARY, CHICAGO.—A. PAGE BROWN, ARCHITECT.

THE subject of our special illustration this week is the new dormitory of the McCormick Theological Seminary, Chicago. It is built of St. Louis brick and Vert Island stone; cornice of stone; interior of first floor of oak, others of yellow pine; iron staircase, elevators, etc.; vestibule of marble, mosaic, etc. It contains study, suites of rooms, besides two recitation-rooms on first floor. Cost was \$110,000. The architect was A. Page Brown, of New York.

OUR VIGNETTE ILLUSTRATION.

OUR vignette illustration is of the house of Mr. John C. Ropes at York Harbor, Me. It is of spruce, frame, clapboarded, cedar shingles on roof. House fronts directly on the ocean, and for that reason the piazzas were made especially large and capacious. The architects were Messrs. Andrews & Jaques, of Boston.

RECEIVING AND CATCH BASINS, WATER-
BURY, CONN.

THROUGH the courtesy of Mr. F. Floyd Weld, City Engineer of Waterbury, we have been enabled to make illustrations of the two forms of basins herewith presented. All engineers who have to do with sewers in steep streets have encountered the difficulty, that the water tends to flow past the basins, and in consequence to flood the gutters at the foot of the grades. To remedy this Mr. Weld uses a receiving-basin similar to those used in Providence, in combination with a catch-basin. The sketch plans show the way in which they are placed. When on two sides of a corner they are about 15 feet from the angle, depending, of course, upon the relative grades, but far enough away to avoid the nuisance of a corner entrance.

There were 14,225 feet of sewers put down during 1885, ranging from 8 to 50 inches, and the total length of streets sewered was on January 1, 14.87 miles. In this important work Mr. Weld has had the able assistance of Mr. Frank W. Whitlock and Mr. H. J. Kellogg.

A careful system of flushing and cleansing all sewers is kept up. Where a flush does not cleanse away the adherent furring of grease and other filth, a scraper made of wood, with rubber flanges, is drawn through the pipes from one manhole to another, and effectively cleans them.

THE REPAIR AND MAINTENANCE OF ROADS.

BY W. H. WHEELER, M. INST. C. E.

(Continued from page 98.)

STEAM rolling is in every way better and more economical than horse rolling, and that the advantages arising from the use of these rollers are economy, facility of perfect construction, comfort to persons and horses using the roads, improved surface, diminishing the wear and tear of vehicles, saving of material amounting to as much as 25 to 50 per cent.

In Paris the method of repairing macadamized roads consists in having the stones broken to such a size that no stone weighs more than five ounces. The interstices are filled with sharp sand. After the road is completed it is maintained in order by constant watering and sweeping.

with a machine—the sweeping following the watering, and the surface being made thoroughly wet, so that the machine will work easily. This is done early in the morning, before the traffic is about. In warm, dry weather the road is frequently watered during the day with hose from stand-pipes, the surface being only moistened : and not made thoroughly wet. In many towns in this country water is poured on to the surface of a road covered with dirt, so that a sea of mud has to be waded through by persons having to cross the road, and their boots become covered with mud on the brightest summer day. This mud soon after dries, and is carried in clouds of dust over the goods in the shops and the clothes of the passengers.

The repair of country roads is a much easier task than that of town roads. The amount of traffic is so small that with ordinary skill, care and attention there ought to be no difficulty in keeping the highways of this country in excellent order at a small cost.

The main points to be observed are : The constant care on the part of the roadman never to let his road get out of order; in no case does the old proverb, "A stitch in time saves nine," apply more forcibly than to road repair; the use of good materials; proper attention to surface drainage; cleaning the mud off in wet weather; removing all loose stones in dry weather.

The roadman should never lose sight of the fact that loose stones are annoying to every user of the road, and always more or less dangerous.

One very essential matter that requires the attention of the roadman is the scraping and cleaning the mud arising

• CATCH AND RECEIVING BASINS • WATERBURY • CONN. •

DETAILS OF RECEIVING-BASINS

When at the side of a steep street, the catch-basin is placed 10 to 15 feet above the corner, and the receiving-basin a few feet further up.

To deflect the water, a thick piece of stone is set on edge near the lower edge of the respective entrances, and raised about 6 inches above the gutter-stone, the paving being shaped so as to avoid making a nuisance to vehicles.

The receiving-basin is simply an opening so shaped as to catch the water and turn it into a 12-inch pipe leading to the catch-basin. Of course, no trap is required. The drawings explain themselves.

The catch-basin is a modified form of one in use in many places. It will be seen that the hinged iron hood trapping the sewer connection has a seal of 14 inches below the bottom of the pipe, being deeper than they are ordinarily made. Again, it was found that in places where the ground was wet, the surrounding soil would freeze fast to the outside of the basin, and the consequent heaving would cause a circumferential crack in the basin, such as at times to destroy the seal.

The bottoms of the basins were then enlarged 8 inches in diameter, and the upper portion made sloping as shown and smoothly plastered outside with cement mortar, since which time no trouble has been experienced. In building new basins, the outside is laid up 4 inches thick, and the inside is made largely of bats, and with a collar of cement between, there being no bond between the inside and outside. As a further precaution the inside is washed over with thin cement grout to fill any defects in the work. The result has been that the work is perfectly tight.

from the wearing away of the materials and the droppings of the horses. It is impossible for the wet to evaporate quickly when the surface is covered with mud. In winter it acts like a wet blanket, preventing the sun and wind from drying the road, and in summer it causes clouds of dust. A road that has not been scraped will remain wet and dirty for several days after an adjoining road, which has had the mud removed, has become quite dry. No road surface can be kept hard, nor can ruts be prevented where mud is allowed to accumulate and remain on the road. To prevent mud forming in wet weather the dirt should be removed in summer. It should be borne in mind that the summer dust makes winter mud, and that it requires much less labor to remove the dust from the roads in summer than the mud in winter.

At the sides of all roads maintained in good order a gutter is formed, and these should be kept clear and free from grass and weeds. They should always be laid out by a competent person, and suitable outfalls made for the water.

The chief requisites of a material for repairing roads are, that it should not only be hard, but tough, and that its composition should be such as that it shall not easily be affected by the weather. For the best road the fragments should be angular and cubical, so as to bond well together, each stone should fit against and be wedged compactly up to its neighbors, as in a piece of mosaic-work, and no space left for water to penetrate.

The materials used must, to a certain extent, depend upon the locality, but it is far more economical to use good material, although it has to be brought from a distance, than inferior local stone procured at less cost. No material is so efficient and really economical as granite or some of the hard volcanic rocks. Even in first cost it is cheaper than gravel, limestone or slag. There is less labor and in putting a durable and lasting material on roads than that is more perishable and requires frequently

• *SECTIONAL VIEW*

Some of the harder limestones and sandstones make fairly good roads. In damp weather in summer they make pleasant roads, but the former especially, although hard and tough, becomes disintegrated rapidly by frost, and both wear into dust in dry weather, and make roads dirty in wet and dusty in dry weather.

The softer kinds of limestone are utterly unfitted for repairing good roads.

Flint gravel makes a clean road and if properly attended to gives a firm surface, but not a very even one. If the gravel is picked off the land or taken from the bed of a river it consists of stones of different degrees of hardness which wear unevenly, and all gravel is more or less round. Even if thoroughly broken there is left one part of the stone which has a rounded surface. Sea shingle and gravel, consisting of rounded pebbles, although clean and hard, never consolidate. Round gravel is one of the worst and most dangerous materials that can be used for roads. If the gravel becomes consolidated in winter it is certain to work loose in the following summer. The constant tendency of all stones having rounded surfaces is to roll round one another when weight is brought on them, and so work loose.

The materials to be avoided are those that are quickly converted into mud or dust and that work loose, and preference should be given to those that, avoiding these evils, make as even a surface as practicable and seldom require repair. The question of first cost, within reasonable limits, need not be considered, as the better the material, the less of it is required, and the less the labor and carting.

With regard to the size to which the fragments should be broken, opinions vary considerably. The old rule was that no stone that would not pass through a two and a half inch gauge should be used for the surface repairs. More recently smaller sizes have been advocated, and the element of weight as a standard advocated. The following standard has been recommended:

	Maximum Weight.	Minimum Weight.
Granite and similar rocks.....	3½ oz.	½ oz.
Flint and similar stones.....	5 "	¾ "
Limestone and similar stones.....	6 "	1 "

One-half of the total quantity to be of the maximum weight, one-eighth of the minimum weight, the remainder to be composed of stones varying between these.

There is no doubt that the hard and tough rocks should be broken into smaller fragments than those that are softer. For ordinary country roads the cleaner and more even the size of the stone the better, as there is always in the road plenty of loose material for bedding the new stones. The author's experience leads him to give as his opinion that for the repair of a main road in rural districts, where granite or similar hard material has not been long used, the size to pass through a two and one-half inch gauge is not too large. If the fragments are smaller than this they are squeezed into and lost in the softer material, their size not being large enough to give sufficient bearing surface to withstand the weight of the wheels of heavy vehicles.

After granite has been used for some time and the road has become fairly coated with it, so as to give a good resisting surface, a size to pass through a one and three-quarter inch gauge is sufficiently large to fill up the depressions. If a smaller size than this is used it will not stand the crushing of the wheels, and soon becomes dust.

All stone should, when practicable, be carted and placed in heaps at the sides of the road during the summer, when the roads are hard. The material is then ready as wanted, and there is less wear and tear on the road by carting than if it be done in winter. All stones harden by exposure to the weather. Stones that have been lying during the summer in heaps will wear longer than those brought directly from the quarry.

As far as practicable materials for repairs should be placed on the roads in the early part of winter to allow of its being thoroughly bedded and incorporated with the old material. As a matter of experience it has been found that stone put on in the early spring, although apparently well bedded and set, will work out again much sooner than that put on in November and December. If it is necessary, as will sometimes be the case, to place the stones on the road at other times than in winter in order to fill up depressions or to prevent the formation of ruts, the surface should be loosened with the pick, the stone evenly spread and covered with road-scrappings. If this be carefully done the place so repaired will soon become as firm and as level as the rest of the road. For repairs of this kind only the smallest kind of material should be used. Many surveyors keep a supply of granite chips purposely for the repair of hollows and defective places in summer time.

It may be taken as a fair estimate for the main roads of this country, excluding the strictly urban portions, that a mile of road will require 40 tons of granite to repair it, and that one man can keep in order four miles of road. Putting the granite at \$2.50 per ton, and the wages \$1.25 a day, this, with an allowance for carting, extra labor, and incidental expenses, would give \$175 a year as the cost per mile. After a road has been thoroughly well coated with granite, the quantity of material required will decrease considerably. On the other hand, roads which have previously been repaired with soft and inferior material will require a larger quantity of material and more labor.

SEWERAGE OF ST. JOHNS, NEWFOUNDLAND.

In a report to the Colonial Secretary by Mr. H. C. Burchell, Government Engineer, a very full description of the existing and proposed systems of sewers in St. Johns is given:

The old sewers are large, varying from 2' x 2' 6" to 3' x 5', and they drain directly into the harbor; "the three conspicuous features of a public cove are, as a rule, a sewer outfall, a public closet, and a fish-stand." All the large sewers are square in section, with mostly dry rubble-stone walls and plank floors, the covering being either of planks or flags. "The efficient trapping and ventilating of house-drains is almost unknown," and the drains discharge into the soil. In addition to all this, large sections of the town are still dependent on wells for a supply of water.

With such conditions it is not strange to learn that some districts of the town "are well known as haunts of diphtheria and typhoid fever." A house-to-house examination was made and a record is given. An evident disposition was evinced among the poorer classes to conceal facts which they imagined might appear to their disadvantage.

The greatest fall of rain during fifteen years past gave 3.69 inches in nine hours, and another gave 3.52 in six hours.

The area to be drained at present is 500 acres, upon which one inch of rainfall would give 11,311,000 gallons, and he estimates a possible amount delivered to the sewers of 12,000,000 gallons in twelve hours or 1½-inch per hour. At 50 gallons per capita per day water-supply, he estimates the sewage proper to be one-sixth of this. Owing to irregular grades and badly constructed bends, the old sewers are often stopped, and the stoppages are more apt to occur from the lack of proper catch-pits or "gulleys" for the gravel, etc., entering from the streets.

After a discussion of the problem, the separate system is recommended for adoption. The old sewers are to be retained for drainage purposes, proper outfalls and street gulleys to be provided.

The scheme provides for 14 miles of 6-inch to 30-inch pipe at an estimated cost (including \$35,000 for an outfall) of \$206,000.

In order to induce persons in moderate circumstances to introduce water closets, it is recommended that a cheap form of closet be furnished by the city at cost.

A set of regulations for sewer connections, the assessment, collection of rates, etc., is appended.

A PAPER on "Class Mortality Statistics" has just been read at the Royal School of Mines, London, by Mr. N. A. Humphreys. The reader quoted the mean duration of life, according to Dr. Farr's English Life Table, as 41; a later table, based on general mortality, increases to 44 years, while the Healthy District Table gives the further increase to 49 years. Ansell's Table of the Upper Classes shows a mean duration of 53 years. Examination of life tables generally showed that child mortality was the controlling element of mean duration. Under 5 years of age, Dr. Farr's Life Table gives the death-rate as 66 per 1,000; Mr. Humphreys' General English Table (more recent than Dr. Farr's) gives it as 61; Dr. Farr's Healthy District Table as 39; and Ansell's Upper Class Table as 28 per 1,000. The proportion of class mortality, 5 to 20 years, is almost as great as that under 5, while the greater vitality in later age periods of the middle and upper class is not quite so strongly marked. The strongest contrast is between the upper and working classes. Dr. Ogies' occupation mortality tables, after making allowances for age differences, taking the mortality of all males 25-65 years at 1,000, gives the following relative mortality statistics: clergy, 556; gardener, 509; farmer, 631; agricultural laborer (country), 701; Cornish miner, 1,839; costermonger, or hawker, 1,879; general laborer, (London), 2,090; hotel servant, 2,205. According to Dr. Grimshaw's Dublin mortality statistical report 1883-1885, the proportion of children per 1,000 in the professional and independent as against the artisan class, showed 75 and 121 respectively. The proportion of persons aged 60 and upwards per 1,000 in the same classes has 150 and 63 respectively. Given identical rates of mortality at each age period, the differences of age distribution gives a death-rate at all ages of 19.5 in the middle and 25.2 in the professional class. Allowing for differences of age and taking 1,000 as the standard of mortality at English Life Table rates, Dr. Grimshaw gives the results for each class as 632 professional and independent, 1,093 artisan, 1,333 middle, and 1,659 general service (including workhouse statistics). The mean annual mortality under five years is five to one in the general service as compared with the professional class. The period of 5-20 years stands at about the same, and above 20 years in the relative periods the proportion is about two to one, between the same classes. The comparison of mortality from specific causes in the same classes—i. e., general service as against independent and professional—shows approximately as follows: Measles, 10 to 1; whooping-cough, 4 to 1; diarrhoea, 3 to 1; scarlet fever, 2 to 1; lung disease, 3 to 1; convulsions, 13 to 1; violence, 5 to 1.

THE TESTING OF PORTLAND CEMENTS FOR THE HARBOR WORKS OF CALAIS AND BOULOGNE.*

BY F. GUILLAIN.

IN 1884, the French Minister of Public Works established a laboratory for testing Portland cement in Paris, with branches at Boulogne, La Rochelle and Marseilles. As the result of a number of experiments carried out at this laboratory with more than 12,000 briquettes, a specification for the supply and testing of Portland cement has been drawn up, the details of which are given in this paper.

To determine the weight of the cement, only the fine powder is used which has passed through a sieve of 5,000 meshes per square centimetre (32,257 meshes per square inch). This powder is filled into a litre measure (1.76077 pint), with certain precautions which are specified. The weight of one litre of the kind of cement delivered must be within 100 grams (3.5 ozs.) of that of a litre of cement of similar fineness ground in the same manner; but derived from specially selected, heavy clinker from the same factory.

With regard to the chemical test, the cement must not contain more than 1 per cent. of sulphuric acid or sulphides in determinable proportion. Cements containing more than 4 per cent. of ferric oxide, or in which the ratio of the silicate and alumina combined to the lime is less than 0.44, are to be regarded as doubtful. In mixing the mortar for testing, sea-water is specified, and both air and water are to be maintained at a temperature of 15° to 18° Centigrade (59° to 64.4° Fahrenheit) during the continuance of the experiments. The proportion of water to be used must be the same for all tests made on the same day with one and the same kind of cement, and the whole quantity of water must be added at once to the 900 grams (31.7 ozs.) of cement used. The mortar is to be mixed with a trowel for five minutes upon a marble slab. The quantity of water is ascertained by a preliminary experiment, and the four following tests are given to serve as an indication whether the proportion of water added is correct:

1. The consistence of the mortar should not change if it be gauged for an additional period of three minutes after the initial five minutes.

2. A small quantity of the mortar dropped from the trowel upon the marble slab from a height of about 0.50 metre (1.63 foot), should leave the trowel clean, and retain its form approximately without cracking.

3. A small quantity of the mortar worked gently in the hands should be easily molded into a ball, on the surface of which water should appear. When this ball is dropped from a height of 0.50 metre (1.64 foot), it should retain a rounded shape without cracking.

4. If a slightly smaller quantity of water be used, the mortar should be crumbly and crack when dropped upon the slab. On the other hand, the addition of a further quantity of water—1 or 2 per cent. of the weight of the cement—would soften the mortar, rendering it more adhesive, and preventing it from retaining its form when allowed to fall upon the slab. It is recommended to commence with a rather smaller quantity of water than may be ultimately required, and then to make fresh mixings with a slight additional quantity of water.

In order to determine the time of setting of the cement, a portion of it is made into a mortar and filled into a cylindrical box of metal 0.04 metre (1.575 inch) in height, and 0.08 metre (3.15 inches) in diameter. The mortar is then shaken down by a few gentle blows, and the water which rises to the surface is allowed to remain. A needle of 300 grams (10.58 ozs.) weight, and with a square section of 1 square millimetre (0.00155 square inch) is suspended over the box by means of a cord and pulley, and the initial set is considered to have taken place when the needle fails to penetrate the whole depth of the mortar if lowered gently upon it. The cement is said to have set finally when its surface will support the needle. Any cement commencing to set in less than thirty minutes, or setting finally in less than three hours, is to be rejected, and the final set must have taken place within twelve hours. In each case the time is reckoned from the moment the water is poured upon the cement.

The water-test is carried out by making pats or cakes of cement 0.08 to 0.10 metre (3.15 to 3.94 inches) in diameter and 0.02 metre (0.787 inch) thick in the middle, and running out as thin as possible at the edges. These are placed upon pieces of glass and immersed in sea-water at a temperature of from 15° to 18° Cent. (59° to 64.4° Fah.). These samples must show no cracks or bulging. Eighteen briquettes are used for the tensile test, the cement being mixed with a trowel in quantities of 900 grams (31.75 ozs.) at a time, and worked for five minutes before use. The form of the briquettes and the machine for testing them are the same as those used in Germany, the breaking-section being 5 square centimetres (0.775 square inch). The molds are placed upon a marble slab while being filled, and are allowed to remain upon it until the briquettes are perfectly set, when they are removed from the molds, and, after the lapse of twenty-four hours from the time of mixing, are immersed in sea-water, which must be kept at a temperature of 15° to 18° Cent. (59° to 64.4° Fah.) and which is renewed weekly. Six of the briquettes are broken after an interval of seven days, six after twenty-eight days, and the remaining six after eighty-four days.

* Abstracted for the Institution of Civil Engineers from *Nouvelle Annuaire de la Construction*.

The mean of the three highest figures of each series of tests is taken as the tensile strength of the cement under examination. The minimum strength specified for the neat cement in seven days is 20 kilograms per square centimetre (284.5 lbs. per square inch) in twenty-eight days, 35 kilograms per square centimetre (497.8 lbs. per square inch), and at least 45 kilograms per square centimetre (640 lbs. per square inch) in eighty-four days. If, however, the strength in twenty-eight days is not more than 5 kilograms per square centimetre (71.12 lbs. per square inch) in excess of that at seven days, then it must be at least 55 kilograms per square centimetre (782.27 lbs. per square inch) in twenty-eight days, and in any case where this strength is not attained at twenty-eight days it must be exceeded in eighty-four. Tests of cement mixed with sand are also specified. The standard sand is produced by crushing quartzite obtained from quarries near Cherbourg, and sifting it through sieves of 64 and 144 meshes per square centimetre (413 and 928 meshes per square inch). That which remains between these two sieves is washed and dried, and constitutes the standard sand. 375 grams (13.227 ozs.) of this sand is mixed with 125 grams (4.409 ozs.) of cement, and water is added in the proportion of 12 parts by weight to 100 parts of sand and cement combined. The sand and cement are first carefully mixed in a basin or capsule, then the whole of the sea-water is added at once and the mixture stirred with a spatula for five minutes. In filling the molds a small rammer, weighing about 200 grams (7.05 ozs.) is used to beat in the mortar until the water rises to the surface. The excess of mortar is then struck off with a straight knife-edge and the surface smoothed down. When the mass is sufficiently hard the molds are removed, but the briquettes are allowed to remain upon the slabs in a moist atmosphere for twenty-four hours, after which they are immersed in sea-water and treated in the same manner as in the tests with neat cement. At the expiration of the seventh day the strength of the sand-cement briquettes should be at least 8 kilograms per square centimetre (113.78 lbs. per square inch), and in twenty-eight days 15 kilograms per square centimetre (213.35 lbs. per square inch). In twenty-eight days the strength should exceed that at seven days by 2 kilograms per square centimetre (28.45 lbs. per square inch). In eighty-four days the strength must be greater than at twenty-eight days, and at least 18 kilograms per square centimetre (256 lbs. per square inch). The eighty-four-day tests are only considered indispensable for those cements which may not have stood the two previous tests; but if, while the cement is in store, the eighty-four-day tests should be unsatisfactory it may be rejected.

The definition of Portland cement given in this specification strictly excludes so-called puzzuolana cements, or those made of lime mixed with slag. The size of mesh of the sieve is not clearly specified, the thickness of the wire not being stated. The percentage of sulphides in the cement is said to be an indication of adulteration with blast-furnace slag, it being supposed that sulphates only are formed during the burning of Portland cement. The degree of fineness to which the cement must be ground is not specified, it being considered that very fine grinding increases the strength chiefly during the duration of the tests, and that the subsequent increase of strength is less with fine than with coarse cement.

DUST AND ASHES.

THE *Building News* prints an interesting lecture delivered at Parkes Museum of Hygiene recently by A. F. Fryer, of Wilmslow, on the subject of "Dust and Ashes," from which the following is abstracted:

Some years have elapsed since the problem was presented to the present lecturer—What is an effective method of disposing of the contents of ashpits? It was found on examination that any nitrogenous matter present was so diluted with water and mixed with valueless solids as not to warrant its extraction. In other words, the cost of isolation was in excess of its value, and this was at a time when the salts of ammonia commanded a much higher price in the market than at present. There thus seemed little choice of method; it was necessary to endeavor to reduce the bulk, and, at the same time, render the material inodorous and innocuous by means of fire. There was nothing new in this idea. But the problem how to burn the refuse without offense had not been solved. The most combustible portion of the material consisted of cinder and dust, which had been rejected from countless kitchen and parlor fires as being worthless. It was only needful to experiment with a few shovelful of the material, even in a dry state, in order to extinguish any ordinary fire. It is well known that a small quantity of finely-divided ashes, or of sand, will extinguish a brisk fire. That water has a similar effect is undoubted. It will require no argument to prove that a combustion of fine ashes, cinders, vitrified ashes, or clinker, with an admixture of broken glass and earthenware, and the ever-present provision tins, all sodden with water, was a compound intractable in the extreme. Analysis showed the percentage of water, the percentage of carbon, and the percentage of inert matter. Hydrocarbons were too insignificant to be taken into account. It appeared that in nearly all cases there was more than one-tenth of the weight of water present as carbon, so that the problem admitted of solution on its chemical side. There was, in fact, a sufficiency of combustible material to evaporate the water. The mechanical aspect was less assuring. It would not be enough to drive off the moisture at a low temperature, and to convert the carbon into carbonic oxide and acid. The organic matter must

not be removed by a process of destructive distillation—it must be actually decomposed. The dust which formed no inconsiderable portion of the conglomerate must not be carried up by chimney to be scattered over the face of the country; and as a fierce draught is essential, the difficulty presented was not a trifling one. To state the problem is almost to suggest the mode of its solution. A furnace must be employed. If properly designed and once put into operation, it should be able to generate sufficient heat to effect the evaporation of the liquids and the decomposition of the organic matter. The furnace must be of considerable size, so as to lose as small a proportion of heat as possible by external radiation. The furnace consists essentially of two parts—the grate and the hot hearth. The grate is about five feet square, and separated from the mouth of the furnace by the dead-plate. The furnace-door is of the full width of the furnace, and is balanced, opening outwards and upwards. The grate, unlike that of a steam-boiler, slopes upwards from the door, and at a more steep gradient. The grate-bars being brought into contact with incandescent material are of wrought iron and of special construction; they are grouped and riveted together in sets for mutual support. Being narrow and very deep, they offer only a small surface to absorb heat from the glowing material, but present a large surface for the air to cool as it ascends between adjacent bars. One skeptical individual, distrusting the slender bars supplied by the makers, filled his furnace with ponderous cast-iron bars of square section, but in twenty-four hours after the usual heat was obtained a number of them were melted away. Behind the grate the hot hearth is placed. It is of the same width as the grate, but rises at the back at a more steep gradient. Indeed, cinders placed upon it are at the limit of the angle of repose, and find their way forward on to the grate with only a slight agitation by a poker or hook. The back of the furnace terminates in two openings; one is made for the admission of the material to be treated, and the other for the exit of the products of combustion. The whole of the structure already described is covered by a semi-circular arch, which is placed on an incline, so that its crown is parallel with the grate. This arch is composed of several courses of fire-bricks, and the space between its crown and the level of the first floor or furnace top is filled in with non-conducting material. The arch is destined to receive the radiant heat emitted from the burning material, to prevent its escape and to reradiate it upon the burning mass like a reverberatory arch. It serves also to absorb heat when the fire burns through to the surface of the refuse on the grate, and is bright and clear, and to pay it back when, from recharging with fresh refuse, the surface is dead. There are two other functions which this cavernous arch is expected to discharge. It provides a space highly heated, enclosed by walls, in which the gases can mix and pause, and in which the process of decomposition of the organic matter in the vapors can be completed before they are hurried into the flue. Again, the large space insures a low velocity of the gases, so that much of the dust which would, under less favorable conditions be carried out of the furnace, remains—part to appear as powder after being highly heated, and very much being molten to the condition of slag. The large furnace-mouth permits the withdrawal of cakes of clinker of any size, and the mischievous effect of the admission of large volumes of cold air is checked by the simple device of reducing the outlet at the back of the furnace to the smallest sectional area compatible with efficiency, so that a large door is scarcely more objectionable than a small one. The flue which conveys the products of combustion from the furnace to the chimney resembles a small railway tunnel rather than an ordinary flue. This arrangement presents two advantages. One is that the low velocity of the gases in moving along it permits the deposit of so much of the dust as had passed out of the cells, especially during the process of clinkering; and the other is the facility it gives for the mixture of the gases from the various furnaces, which, fed and clinkered in succession, discharge the gases at different temperatures, by this means giving an assurance that nothing shall enter the chimney unless it has been raised to a high temperature, and maintained at that temperature during a sufficient time to effect complete decomposition. In order to prevent the gases being cooled in the flue, it is placed immediately beneath the furnaces. The chimney is usually from fifty to sixty yards in height. Imagination would fail to marshal the various articles which go to make up the aggregate which is carted to the destructors. Carts laden to the utmost move in a constant stream toward the depot, and where it is practicable they are drawn up to a gently inclining roadway so that their contents can be cast in a closed shed, with galvanized-iron roof, placed above the platform of the furnaces. In contracted places, where the inclined plane is impracticable, the material is hoisted either by means of an elevator or by lifting the bodies of the carts with their contents to the required height, capsizing them, and replacing them on the frames of the vehicles. The upper floor of the furnaces is purposely arranged so as to hold only a few hours' supply of refuse, and thus the only objection which can arise from a properly worked destructor is obviated. If refuse be permitted to accumulate and ferment, it may emit offensive odors, and the proper course is to limit the storage capacity to what is needful to carry on the process without cessation. If removed daily, there is no ground for complaint. Let us, then, imagine a set of cells ready for operation. It is necessary to maintain fires of coal in them until the brick-work becomes hot and dry, and the chimney exerts its full power. Then the refuse is introduced, and coal is never used afterward. Every portion of the refuse

rests in turn on the dry hearth, and the hot gases pass over it on their way to the flue. It is completely desiccated, and portions become red hot. When the portions which have been laying on the grate has been thoroughly burned, it is found that the non-combustible portions have mostly been fused into the form of a large clinker which the stoker withdraws by means of a hook and allows it to fall into an iron barrow or truck. The inclination of the grate favors the operation, and the wide mouth of the furnace offers no obstacle to its removal. The operation is repeated at intervals of two hours. The heated and dried material is readily drawn forward from the hot hearth, and fresh refuse is admitted at the rear. Baskets and bulky, but light, materials are admitted through a large hole left in the crown of one or other of the cells, and closed by a suitable door. The name "mattress-hole" gives some idea of its size and the uses to which it is applied. The weight of the refuse is reduced from four to one, and there is nothing offensive to the senses or in any way objectionable in the gaseous products passed through the chimney, or the solids or clinkers withdrawn from the furnace. The heat generated is often sufficient to burn iron wire, with the emission of brilliant sparks. Glass bottles are fused, and some varieties of pottery likewise melted. Dust and ashes often become slag. The destructor, indeed, fuses everything and refuses nothing. It is not alleged that it is impossible to create a nuisance by means of the destructor. It requires, indeed, very little acuteness to counteract many of the devices which make the operations of the destructor practically perfect. By the simple process of checking the draught, either by allowing the flues to become choked with dust, as by admitting abundance of air at the feeding hoppers, the character of the working becomes radically changed. No longer is the high heat, which decomposes organic matters, maintained, but a low temperature results, which suffices to distill off noxious fumes, without the means of decomposing them. The effect may be increased by suffering the ashpits to become choked with ashes, and thus check the admission of air, and, at the same time, burn the fire-bars away. The introduction of a hole into the side of the chimney is also an ingenious device for producing odor, by lowering the temperature of the combustion. The introduction of holes in the furnace-doors, beyond those which are needed to keep them cool and burn the very small quantity of hydro-carbon present in the refuse, produces a like effect. There is no special care required in tending the destructor. That the heat is intense is evident from the circumstance that, when the gases have passed through the furnace and along the main flue on their way to the chimney, they are usually led through a multitubular boiler, and serve to generate steam at 40 lbs. pressure to the square inch, in quantity sufficient to drive a steam-engine and furnish the power needed to grind the clinkers, mixed with hydrated lime, so as to make mortar, or a sort of concrete suitable for flooring or for walls. When this is done, the whole of the solid matter is utilized. Everything entering the depot possesses a negative value, and everything taken out has attained a positive value. The process is by no means offensive. There is nothing worse met with than the refuse which most people have seen in detail without complaint. After, at most a few hours, it disappears down the throat of the burning fiery furnace, and when it reappears there is nothing of which the most fastidious might complain. The contemplated erection of a furnace for the destruction of refuse matter naturally creates a strong feeling, and often a strenuous opposition among the residents in the locality. The marvel is that the earliest destructors ever were erected. It is frequently of little avail to point to the successful working of the furnaces in many towns. Prejudice in this, as in every other form in which it appears to mankind, is utterly intractable and as well as protean. In most cases, however, the necessities of the place, and the persistence of the authorities, who have first satisfied themselves by careful inspection of other destructors in operation, result in the erection of furnaces; but the ebullition of feeling increases in vigor until they are put to work. The destructor in Whitechapel is placed in the midst of one of the densest-peopled districts in the world. Complaints were grave and frequent, and were scarcely amenable to the argument that whatever might be at fault, at least the destructors were not, as the furnaces were not completed, and consequently not in operation; when, however, the work of the perfect apparatus commenced in earnest, the complaints ceased. The destructors, in which excrementitious matter is burnt, are as inoffensive as those from which it is excluded. The prejudice in both cases is not, however, the same. Indeed, it needs no explanation to the chemist that if the products are raised to a sufficiently high temperature organic matter, as such, must cease to exist.

THROUGH the efforts of Mr. Joseph J. O'Donohue the bill releasing all orphan asylums of New York from water taxation has been signed by Governor Hill. In Brooklyn it will affect six institutions, as follows: Brooklyn Howard (colored), Dean Street, near Troy Avenue; Church Charity Foundation, Albany Avenue, corner Herkimer Street; Hebrew Orphan Asylum, 386 McDonough Street; Protestant Orphan Asylum, Atlantic Avenue, near Kingston; Roman Catholic Orphan Asylum of the Church of the Holy Trinity, and Roman Catholic orphan asylums as follows: St. Joseph's (female), Willoughby Avenue, near Sumner Avenue; St. Paul's (female), Congress, near Clinton Street; St. John's Home (male), St. Mark's Avenue, near Albany; St. Malachi's, Atlantic Avenue, corner Van Sicklen.—*N. Y. World, July 1.*

HOT-WATER CIRCULATION FROM KITCHEN ON TOP FLOOR OF BUILDING.

WE illustrate this week the arrangement of the kitchen boiler and hot-water supply in the rectory 45 East One Hundred and Twenty-ninth Street, New York.

Cold water is supplied to the various fixtures from a rising line of pipe branched from the main supply-pipe in the cellar, so arranged as to be filled by tank or street pressure at pleasure.

For the hot water, the pressure in the street-main is sufficient to raise the water into a small tank on the roof, from which the supply-pipe to the boiler is taken. The kitchen being on the top floor, the usual method of circulation could not be adopted. The boiler was, therefore, made single, and the main hot-water pipe carried from it directly to the ceiling of the basement and then returned to the top floor, where branches were taken out to the various fixtures on that floor. The main hot-water pipe was wrapped with boiler-felt to prevent radiation of heat, and all branches were taken from the rising portion of the line.

Whenever a hot-water faucet is opened, the water passes down the main and up the return to the floor where the draught is occurring. By this means, and by the fact that the kitchen sink is at the end of the line, the supply-pipe is kept full of hot water, which flows as promptly on opening a faucet as with the usual method of circulation.

THE Board of Electrical Control, of New York City, was organized on July 5, by electing Jacob Hess, President, and Theodore Moss, Secretary. This is the reorganized Electric Wire Subway Commission.

A TRIAL of a street-car impelled by an electric motor was made in Philadelphia on June 30. The batteries were manufactured by the Electrical Accumulator Company of New York, and consist of eighty-four cells. The track upon which the car is run is 1,000 feet in length, with four curves, one of which has a radius of thirty-three feet. The exhibition was satisfactory.

THE Julien electric motor for street-cars was tried last week on the Fourth Avenue Surface Railway in this city, with satisfactory results.

LIGHTNING-CONDUCTORS FOR GAS-WORKS.

In January last the chimney of the gas-works at Fécamp was destroyed by lightning; and in consequence of this disaster, a report was obtained from M. Colladon upon the question of the utility of lightning-conductors for buildings in gas-works. The matter was mentioned by M. Debar at the meeting of the French Society of Civil Engineers, and M. Colladon thereupon communicated to the president of the society a statement to the effect that chimneys in gas-works should always be provided with lightning-conductors fitted with powerful tapes for the safe conveyance to earth of heavy charges of electricity. M. Colladon cited cases to prove the disastrous effects of single discharges of electricity upon unprotected structures. He recounts how the destroyed chimney at Fécamp, which was thirty metres high, without a conductor, was built upon a foundation more or less humid from the vicinity of the sea, and containing gas and water mains, which are good conductors of electricity. In the neighbor-

TOWN CONTROL OF NATURAL-GAS.

THE great development of natural-gas enterprises in Ohio has directed unfavorable criticism, says the *Cleveland Leader*, to a law which the State Legislature passed last March, giving to municipalities the right to control the price of gas. It is reported that some enterprises requiring large expenditures of money have been abandoned, for fear of this provision of the law. The text is as follows:

SECTION 1. Be it enacted by the General Assembly of the State of Ohio, that sections 2478 and 2491 as amended April 2, 1880, are so amended as to read as follows:

SEC. 2478. The Council of any city or village in which natural or artificial gas companies, or gas-light and coke companies, may be established, or into which their pipes or mains may be conducted, are hereby empowered to regulate, from time to time, the price which such natural or artificial gas, for lighting or fuel purposes, furnished by such companies to the citizens, public grounds and buildings, streets, lawns, alleys, avenues, wharves, and landing-places; and such natural or artificial gas-light, or gas-light and coke companies, shall, in no event, charge more for any natural or artificial gas furnished to such corporation or individuals than the price specified by ordinance of such Council; and such Council shall also have power to regulate and fix the price which such companies may charge for rent of their meters.

SEC. 2491. A municipal corporation may contract with such company for supplying with natural or artificial gas for the purpose of lighting or heating, the streets, squares, and other public places and buildings in the corporation limits; but this section shall be subject to the restrictions in the last clause of section thirty-five hundred and fifty-one.

SEC. 2. That section 2478 and section 2491, as amended April 2, 1880, are repealed.

SEC. 3. This act shall take effect and be in force on its passage.

FOOT-VENTS: THEIR LOCATION AND TERMINATION.*

THE regulation of the details of drainage in houses is very important. The great diversity of opinions on this subject has led to no end of discussion. We have of late many popular books on this subject, but the authors do not always agree, and this disagreement gives an impression to some, if not all their readers, that the writers are only half informed after all, and perhaps know but very little more than the balance of us. Their trifling mistakes and omissions can readily be forgiven when regarding the influence they may have in educating the people and awakening public attention and interest to a subject of such vital importance. The only danger is that too implicit reliance may be placed on any such publications as contain all that is known at the time of their publication, or advise the best thing to be done under the circumstances. The fact is this, the whole subject is so new and unexplored that no man has the time to write and publish a book on it, without considerable risk of finding his practice thrown out of date and superseded by some new discovery in physiology or chemistry or some new mechanical device which the army of inventors have contrived while he has been writing. Yet, much good has been done, and can be done, by such publications. No general rule can be laid down for universal application in such matters as the details of drainage and ventilation with any better prospect of success than in the practice of medicine. Within the last generation our houses have changed their character to a very marked degree; not only have their exteriors received artistic development, but their interiors as well. Meantime the introduction of public water-supplies in most of our cities and large towns during the same period has led to the almost universal use of the water-closet in our houses. What was looked upon as a luxury thirty years ago is now regarded as a necessity, and even the cheapest class of houses now have this device. The introduction of waste-pipes for drainage inside our houses, with a constant water-supply, has led to a ramification of the system, and a multiplication of these appliances for the sake of convenience, with too little regard for the risks encountered. In fact, these risks were at first hardly known by any, and if now known do not seem to be understood by many. For this end nothing on the part of the plumber will tend to inspire public confidence so readily and so permanently as the perfect knowledge of his own business and an earnest desire for truth in study as well as in practice. He must show a conscientious faithfulness, and a proper regard for economy in devising the best possible means of reaching the desired ends. If the plumber pursues this course, the public will soon learn to have faith in him as a necessary member in the great social circle, and will heartily contribute to his support. I think all danger arising from sewage gases escaping into the house through unsealed traps can be prevented. The system I would recommend is the placing of a good trap and manhole, well ventilated, at the furthest convenient point from the house; and from the house side of the trap lay two drains, one for the principal sewage and one for the rain-water and waste-pipes from bath and sinks, etc. Another trap and manhole should be placed a few feet from the wall on each of the two principal drains, and these should be ventilated by means of a pipe carried from the manholes to near the smoke-flue, or placed between two smoke-flues, terminating at a chimney-head; this would cause a down current through the soil and waste pipes in

* An essay by J. Giles Smith, Wichita, Kan., read before the National Association of Master Plumbers at the recent annual convention.

hood there were also deposits of coal and coke. It was therefore in a condition to attract lightning; for it is known that soot and tar, such as are found deposited upon the walls of all chimneys, are good conductors. Under such circumstances, therefore, it is particularly desirable that the chimney should be provided with a good lightning-conductor connected to earth with special care. The gas-works at Geneva have a chimney surmounted by a heavy iron cap which terminates in a pointed rod of platinized copper. This rod was in connection with a conducting cable formed of six strands, each of six tinned-iron wires two millimetres in diameter. This cable descended to a depth of three metres below the surface of the ground, where it was doubled in several convolutions, which, even in summer, were immersed two metres in the waters of the Rhone. In July, 1877, however, the point of the conductor was struck and fused by lightning. At a height of 3.5 metres above the ground, a portion of the charge left the conductor and spread along the iron-work of the roof of a shed built against the retort-house wall, after which it pierced this wall, which is sixty centimetres thick, displacing a block of stone in the way to attain the iron gas-pipes which served to light the interior of the retort-house, whereby it finally escaped to earth. Since this event the cable has been supplemented by a better conductor.—*Journal of Gas-Lighting.*

the same direction as the flow of water, etc., in these pipes. Then take a ventilation-pipe off the tail-end of each trap and carry it through the wall, and terminate it at the outside with a hinged grating, and by making the ventilating-pipe the same size as the pipe it ventilates, you will get a supply of air from each grating, following the volume of water as it passes the various branch connections in its descent, which will leave the water in the traps undisturbed, as no actual vacuum can possibly take place with a separate supply of air to the soil-pipe at each floor-level. The gratings in the face of the wall are supply, not exhaust, gratings. Therefore no sewage gases escape near the windows, but are drawn up to the chimney-head by means of the pipe from manholes.

TRADE-SCHOOLS AND TECHNICAL EDUCATION IN THEIR RELATION TO THE PLUMBER OF THE FUTURE.*

It would be futile to endeavor to grasp in its entirety the full scope of the proposed subject within the narrow limits of this paper, and we will therefore discuss, as briefly as may be, some practical ideas which suggest themselves which the members of the National Association may be induced to take into consideration and develop into something that may be of tangible benefit. Trade-schools are no novelty in this age, and yet are not well understood, even among those who may be supposed to possess more than ordinary intelligence and are looking forward in various directions to find a way to solve the problem of the training of the mechanic of the future. Technical education of one kind or another has also occupied a great deal of the attention of educators. As to the somewhat broad distinction existing between the trade-school and the technical school, although the aim and object of each appear to be the same, technical training, in its true sense, means instruction in the use of tools and processes without regard to any particular trade, and is simply used as an adjunct to the ordinary education of the day, thereby instilling into the mind of the youthful student such practical discipline of the hand and eye as is absent from the usual course pursued in our common schools. It is a great pity much of the value of the ordinary education imparted to the multitude of young people who attend school is lost, because it deals so much with abstractions. The schools have taught history, mathematics, language, literature, and the sciences to the utter exclusion of the arts, notwithstanding the obvious fact that it is through the arts alone that other branches of learning touch human life. Every one who looks back to his younger days can call up, without much of an effort, the tedious hours he spent over badly-understood rules of grammar or arithmetic, the prosy details of history or geography, and the many hours spent in copying models of writing, or drudging through dreary formulas of algebra or geometrical problems. And why was this done? Because it was commonly reputed to be the correct way to educate, and there appeared to be no other. It is so still in the vast majority of schools, and apparently will be for a long time to come. Without deprecating a system that at least is hallowed by the customs of bygone generations, it may be permitted to ask, "Could nothing be substituted for it? or could no improvement be made by which more substantial benefits would be obtained than we are now partakers of?" It is conceded that where the two systems are combined—that is, instruction in purely literary subjects, and in technical training—the results have been vastly in favor of the union. The time devoted to any work is not detracting from the value of the mental education, and the reason is plain—that when all the faculties are in exercise they eventually exert a healthy and stimulating effect on each other. Hence, advanced educators, without reference to the mere value of technical training in itself, declare that the benefits of an education are extensively enhanced by the judicious mixture and material support afforded by each in turn, and that the training of the eye and the hand reacts on the brain. Stimulate each to excursions into the realm of scientific discovery in search of facts to apply in practical form at the bench or in a building. The new education is the blending of moral and mental training. It recognizes that science discovers and art outlines, and that these two forces move the modern world. Such being undeniably the case, as evidenced by careful experiment and observation, what a striking commentary is here afforded of the power of musty precedent, when we are still content to plod wearily along in the time-worn ruts of ancestral habits! The dawn, however, is breaking, and efforts are being vigorously made to burst their trammels. The New York Board of Education, as is stated, has appropriated \$50,000 during the present year to test the proper effect of the combined system of education, but considering that the board consists mainly of purely professional men, as distinguished from those directly connected with the practical aspects of our work, it may be premature to expect the largest results from the experiment about being tried. So much for technical education. As already remarked, a distinction exists between technical and what are known as trade schools. While in the former the training is general, as far as the use of tools and methods of work are concerned, in the latter the instruction is specific and has direct reference to some trade in which the learner desires to become proficient. In some of the European capitals great strides have been made in the establishment of trade-schools, where people are taught

all the elementary principles and methods of work, and, having acquired those, are considered to be in the best possible form to be admitted to furnish their apprenticeship in the shops and factories of actual life. It is to be regretted that so far not very extended efforts have been made to establish so commendable and rational a scheme of education in this country. Whatever has been done so far is mainly the outcome of private enterprise and munificence, or is under the honorable auspices of the Philadelphia Association of Master Plumbers, which is presumably the only organization of our trade which has recognized its duty and its privilege in establishing the trade-school. How far successful it has been in results is not known to the general public, and that it would be of the utmost interest to learn goes without saying. The Baltimore and Ohio Railroad Company has also in operation a very complete system of industrial education, and the results obtained have been of the most encouraging and satisfactory character. New York City, as befits the metropolis of the Western world, has not been behindhand in attempts to solve this mighty problem of how the young men of the country shall be promoted to take their place in the ranks of industrial progress. It has been left, however, to the enterprise and benevolence of a well-known citizen in that city to found and equip perhaps one of the completest in design and most practical institutions of that class that has been yet organized. Although yet in its infancy some nine or ten trades, all but one connected with house-building, are practically taught in one session of five months, and the skill and amount of knowledge acquired in that short course have surprised and pleased the practical men who have closely watched the experiment with more or less doubt as to its success. The schools are composed of a series of large buildings covering an area of nearly 20,000 square feet, and are fitted up with every appliance necessary for their complete work. They are not self-sustaining, as is very evident from the nature of the trades carried on there, and the expense is in part sustained by the small admission fee from each pupil and the remainder is borne by the founder. Not taking into consideration the cost of the buildings and land, it is stated on the best authority that these schools have cost some \$30,000 additional, the simple reward for such unprecedented liberality in an untried and experimental field being the knowledge that over one thousand young men have been placed on the road to an independent future. The fame of the school is already national. Young men from the West as far as Denver, Col., from the South as far as Atlanta, Geo., from Montreal and various other parts of the Continent have paid their own traveling and other expenses in order that they might acquire such knowledge as is imparted in this institution. The question here arises,—and (turning to the Chair) you, Mr. President Allison, may be addressed appropriately in relation thereto, as you are known to be in hearty sympathy with the noble cause of industrial education—What can this National Association do to forward it? Philadelphia has already answered by a tongue louder than words. May not the suggestion be permitted that the local associations should put their shoulders to the wheel and endeavor to make a beginning in their respective cities to establish, even on the most modest scale, their trade-school, sustained and engineered by their officers and members? Another suggestion may not be out of place. The expense of board and tuition in New York for a session is something formidable for a young man beginning life. Could not the local association, pending the time of establishing its own school, give a free scholarship to the New York training school, as a prize to excellence in apprentices, and thus stimulate a generous rivalry among them for that distinction? It is not necessary to tell the members of the National Association that there are trying, stirring times for our craft, and that no means should be untried to elevate and promote the welfare of those who will be the mechanics of the future, and it is difficult to perceive how a more unobjectionable and efficient plan could be adopted than that of following the example of the best men in the country in their efforts to raise the standard of mechanical education among our young men. Our trade has been reproached, though unjustly, with having made no well-directed endeavors to sustain and keep filled the ranks of capable workmen. Considering the difficulties inseparable from the mode in which young men acquire the knowledge of the plumbing trade, it should be our anxious care that those difficulties should be diminished and through approved efforts every possible agency for the good work should be pressed into service. While perhaps not exactly pertinent to the subject, it may not be amiss to advert to the excellent system of apprenticeship of the city in which this convention has the honor of being held. This system, if faithfully carried out, and supplemented by some preliminary education in a trade-school, possesses advantages far in advance of any legal or compulsory apprenticeship that has ever been devised. The one is young, full of promise and consonant with the spirit of the age; the other is worn out, inconsistent with manly self-respect, and wholly inadequate to its purposes and should be relegated to the dust of the tomb with other works of bygone ages. It is the purpose of the association of New York to complete the work it has been engaged in during the past year, waging its battle for the boys and carrying out to its full extent the system above alluded to. That it had taken no previous action during the lifetime of the association may perhaps be explained by the difficulty of sufficiently arousing the conscience and intelligence of men already overburdened with the cares of business. The crisis passed through, however, must be sufficient to prove that we must be on the alert, not only to meet and confront danger, but, as wise and discreet men are the

cause of discontent and thus brighten the path of the plumber of the future.

SECOND ANNUAL REPORT OF THE BOARD OF HEALTH OF THE CITY OF NEWARK, N. J., for the year 1886. 61 pp., 8vo. Newark. 1887.

This report is prepared by Dr. David L. Wallace, the Health Officer of the city and Secretary of the Board, and is of special interest at the present time in connection with the question of the pollution of the Passaic River. Dr. Wallace reiterates the statement made in his previous report, that the water-supply of Newark is polluted, and that the city of Newark and points below its intake are responsible for two-thirds of the pollution. He thinks that the remedy is to improve the present supply rather than to obtain a new supply from the head-waters of the Passaic, and suggests that filtration with aeration and the compelling manufacturers and communities along the line of the river to subject their sewage to such a degree of purification as will return the effluent water to the river with at least fifty per cent. of its organic impurities removed will accomplish all that is needed.

In many sections of the city there are no sewers, and even where these have been constructed privy-vaults are the rule rather than the exception, being connected with the sewers by overflow-pipes without traps, which is about the worst possible arrangement that can be devised. Dr. Wallace advises that "an ordinance should be passed requiring that all leaching privy-vaults and cesspools should be abolished on premises abutting in streets in which sewers are laid." If the word "leaching" were omitted from this sentence, it would be good advice, but as it is, it does not touch the chief evil—viz., that of tight vaults having overflows to the sewer, and which are constantly delivering putrid sewage. So long as this is allowed it is impossible to keep the sewers in satisfactory condition.

Good work has been done in carrying out a system of house-to-house inspections. There have been 11,757 houses inspected, in which 1,844 nuisances were found. Defective plumbing and drainage was found in 1,037 cases, or in nearly ten per cent.; 1,129 private wells were found connected with these premises. Bearing in mind the number of leaky cesspools and privy-vaults in the city, it is a question whether the water from these wells or that from the Passaic is the most dangerous.

The total number of deaths reported for the year was 3,602. The population is estimated at 160,319, which gives an annual death-rate of 22.5 per 1,000. While this is at least 3 per 1,000 higher than it ought to be—that is to say, while between four and five hundred of these deaths were due to defective sanitation and were unnecessary—the wonder is that the death-rate was not greater. It is certainly time that Newark set seriously to work to get rid of its privy-vaults and cesspools, to complete its sewerage, and to secure a water-supply fit for use by a civilized community.

ALBANY WATER-SUPPLY IN 1686.

MUCH has been spoken, written, and printed in this city, during the past ten years, concerning the nature and purity of Albany's water-supply. Long and earnest have been the discussions in the Common Council and by the water commissioners, health officers, city physicians, and others on this topic, yet nothing that they have set forth against the impurity of the old city wells, the condition of Tivoli Lake and environs, or of the potable qualities of the Hudson River water, can go to establish that the Albanians of to day have a more impure aqueous supply than did their forefathers of two centuries ago. For at a meeting of the Common Council of the city, "held ye 6th day of November, 1686," the following minute and resolution was adopted to cure an already existing evil:

"Whereas, there hath been divers orders published from time to time concerning ye wells and fountains of ye city where sundry people rinse their clothes, throw down water and all sorts of filth neer to ye sd wells and water their horses out of ye pales yt hangs at ye same and draw water with foule pales; it is therefore ordered, by ye mayor, recorder, aldermen, and commonalty of ye city, yt no person whatsoever shall for ye future rinse clothes, throw water or any sort of filth in or neer any of ye wells or fountains within this city, nor water their horses out of ye pales yt hang at ye same, or draw water with any foule or dirty pale, upon pain of forfeiture of ye sum of 12s. for each offense; one moyety thereof to ye mayor, aldermen, and commonalty of ye city & ye oyr moyety ye use of ye sheriff, constable or any oyr person as shall inform or sue for ye same."

The only effect that this ancient ordinance seems to have had, judging from the happenings of this year of grace, was to teach a better code of etiquette to the quadrupeds, for it may well be doubted if now a horse can be found in the city that will drink from a filthy pail.—*Albany Argus.*

* An essay prepared by the New York delegation, and read before the National Association of Master Plumbers at the recent annual convention.

THE ANNUAL CONVENTION OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

HOTEL KAATERSKILL IN THE CATSKILL MOUNTAINS, }
July 7, 1887.

LAST Thursday evening, at an informal meeting at the house of the society in New York, arrangements were completed for our trip hither on the following day (July 1). We left the city Friday morning by the Day Line steamers on the Hudson River for Rhinebeck, the landing, where we were to be transferred to the cars through the valleys of the Catskills. We had on board a majority of our members and guests. At Rhinebeck we crossed the Hudson by ferry and took a special train on the Ulster and Delaware Railroad to Phoenicia, the connecting point with the Stony Clove and Catskill Mountain Railroad. From Phoenicia this narrow-gauge railroad carried us through the grand scenery of the Stony Clove and the valleys or gorges between Phoenicia and the Hotel Kaaterskill. The railroad is in part built on the mountain side with only a few feet between the rails and the precipitous descent. Hundreds of feet below lay the valleys. Through this region we traveled in open observation cars giving us a fine view of its beauty. We arrived at Kaaterskill station in the early evening, and were conveyed to the hotel in stages.

Arrived there, the members were gathered on the grand plateau in front of the hotel, and Mr. William G. Hamilton, Chairman of the Committee on the Convention, presented the following address of welcome:

Ladies and gentlemen and guests, members of the American Society of Civil Engineers. On behalf of the Committee of Arrangements I welcome you to your new home for the coming week.

We have safely passed over the stormy Tappen Zee; skirted the passes of West Point, bristling with cannon; piloted with skill the shores of the Dundenberg, and climbed the mighty ascent of the Appalachian chain.

Creation is before you. Liberty guards the portals of the Hudson—the engineers the summit of the Catskills. Our Surveying Corps reports that we are safe, though encircled by "dears."

Your flag of possession will float over your heads as a token of our mastery of the situation.

In the study of your profession and in the search of the known and unknown take squatter sovereignty of the glades and glens. In your visits to the woodlands let the trees and rocks be the only confidants of your philosophical discourse.

When treading the rustic paths or crossing the mountain streams go two by two of assorted sexes, so that you can fully appreciate the proportions of the Cantilever system, or can't-I-lover form.

Luna, at our request, being full of light, will beam on you with loving rays. Later on we will have learned practical treatises on Poughkeepsie bridges, which, we trust, will not prove Bridges of Sighs.

We hope to treat you to a feast of reason and a flow of soul, where the learning and eloquence of our brethren and sisters will cast new glory on our society, and pass to posterity sweet memories of this our Nineteenth Annual Convention.

In welcoming you to this beautiful spot we hope, laying aside all cares of the outside world, we may worship Nature in all its loveliness and in close communion.

To sustain you in this arduous task forget not to partake liberally and with punctuality of the viands which will be hourly set before you. To revive your spirits let not engineering qualms act as a bar against the search of mixed quantities and potentials. Lean upon each other with disimulation; assist each other in treading the winding ways or scaling the giddy heights.

Hoping that your committee may, in all things, warrant your approval, and that this meeting may be cemented by bonds of stronger friendship, and that your flag may long wave over the deliberations of this, one of the most enlightened and cultivated scientific bodies in our proud Republic, I bid you welcome in the name of our committee.

"Unfurl the flag and pass the loving cup."

The emblem of the society—a white flag with their coat-of-arms in the centre—was unfurled, after which the members sang an original composition, entitled, "Salute to the Flag." All hands then formed a circle, and the wassail cup was passed around.

The words of the song were as follows:

SALUTE TO THE FLAG.

First on this mountain height our flag floats to the skies,
And as its colors rise above us, let their hue
Be symbol of that honest faith and life we prize,
And of the earnest work we ever strive to do.

No symbol this of war, nor yet of strife with man;
But badge of vict'ries won o'er Nature and its powers;
Helping by thoughtful art the world to better plan,
Proud that such noble work fills all our busy hours.

After singing and the wassail bowl, supper followed, at which each lady was presented with a bouquet of flowers and the compliments of the society.

JULY 2.

The convention was organized at 10 A. M. by the appointment of T. C. Clarke, M. Am. Soc. C. E., of New York, as chairman.

The first papers read were discussion on the "Inspection and Maintenance of Railway Structures," which continued until nearly half-past one.

Some time previous to the meeting of this convention the following "suggestions" were sent to members supposed to be familiar with them:

What measures, legal or other, can be taken to insure a proper inspection of railway bridges?

What is proper bridge inspection?

Should there not be a standard specified rolling load much heavier than as now generally used, and a specified engine wheel base for rolling loads?

Is it not expedient to adopt a standard bridge floor?

Should not bridges of small span be made strong enough for a buckle-plate floor, and a continuous coat of ballast on the bridge, and if so, up to what span should this apply?

Should not a safety guard (Latimer) be used at all openings over a certain width?

Should there not be required, either overhead crossings, or, in their place, interlocking apparatus with derauling switches?

Is legislation as to any of these points, or as to any others you may suggest, expedient, and if so, what sort of legislation?

In this connection the experience of the Master Car Builders' Association has been referred to, which, it is stated, has proved that the action of large committees reporting to the society, and the adoption of standards after ample discussion, have been found very valuable.

The first paper read on this subject was by John A. Wilson, of Philadelphia, the title being "Maintenance and Inspection of Railway Structures," and read by the Secretary.

He stated that the engineer in charge of bridges should have full detailed plans of the structure with strain sheet and calculations showing what load the bridge will carry with safety, personally making a critical examination at least once a year, and oftener if necessary. A competent master mechanic should make an examination once a month giving a detailed report to the engineer in charge. The road foreman and watchman should make daily examinations, reporting promptly any defects discovered. Each railroad should establish a standard for its own line, high enough to cover all contingencies and conform their bridges thereto. His objection to grade crossings were "danger to life and property, delays to traffic, and expense of operating." Separation of grade crossings should be made wherever practicable.

The next was a paper by Willard S. Pope of the Detroit Bridge and Iron Works, and read by Mr. Hamilton. He favored a State Commission, composed of civil engineers, and appointed by the officers of the railroad companies on account of their large acquaintance with engineers. All plans of new structures should be submitted to them. "Bridge inspection to be efficient must be done intelligently. To the trained eye its defects if any are patent. Bridge wisdom is peculiarly a specialty. It comes only by patient study and long training."

The fourth paper was by Charles A. Marshall, Engineer of Tests, Cambria Iron Co., Johnstown, Pa., and read by Mr. Wiley. The writer advocated a commission appointed annually by the State composed of expert engineers, some members holding over. The duties of this commission should be to examine and license inspectors. The licenses should be of three different grades:

1. As to materials.
2. As to fabrication.
3. As to compliance with general strength.

These inspectors should pay a moderate annual license fee, and it should be a penal offense after a specified lapse of time to build certain classes of structures without securing their services.

The fifth paper, by Albert Lucius, New York, was read by Mr. Wellington. This writer preferred a floor of closely laid ties on iron stringers, the latter spaced sufficiently far apart to give the floor a certain small amount of elasticity, to a floor under a buckle plate and ballasted.

The sixth paper was by Andrew Bryson, New York, and read by Mr. Croes. He would compel the railway companies, by legislative act, to either keep in their employ competent men to inspect their bridges, or have an inspection made at least once a year by a competent outside engineer, and to furnish strain-sheets and detailed drawings to the Commission. There should be a standard specified rolling-load much greater than is now used, and a specific wheel base for rolling-loads. This standard should be prescribed according to the nature of traffic.

As to bridge floors, "It seems to me that if the width and strength of floors were specified the manner of meeting these requirements could be left to individual designers."

The next paper was by E. P. Dawley, Engineer of the New York, Providence, and Boston Railroad, and read by the Secretary.

"It is doubtless pretty well agreed among engineers that 3,000 pounds per lineal foot of track is not enough for spans 100 feet and less to discount future service. This road has used for several years past a rolling load of 3,000 pounds per lineal foot of each track; the dead load per floor being 500 pounds per lineal foot. Strains allowed the same as Erie's specifications. The following is the standard floor used: Hard pine timbers 8'x9'x26', supported below in case of a through bridge by seven stringers per double track, timbers being laid flatwise, fifteen inches between centres. A guard timber 8x9 inches outside of each track, and a third one half way between tracks. Guard-rails running to a point in centre of each track, and continued across bridges seven inches from main rail. Guard timbers at ends of bridges arranged as per Child's plan for the Latimer safety-guard."

The next paper in this discussion was by Samuel T. Wagner on "Inspectors and Bridge-Work," and read by the author.

"Inspection may be divided into two distinct classes—First, those that know what they want and know when

they have it; Second, those that do not know what they want, and therefore are at a loss to decide when they have it.

"Manufacturers may also be divided into two classes—First, those that intend to give good work, who have a reputation at stake and value it; Second, those who will resort to underhand dealings in order to pass off work, and whose object is to make money at the expense of their reputation." He recommends that all material that has been accepted from the mills should be stamped by the inspector, and also every finished accepted member. A naturally suspicious inspector will be a source of needless worry to all around him, while one free from it, and possessed with an ordinary amount of common sense and intelligence, can get good work without making needless trouble, even if his technical knowledge is small. Assuming that all iron for a bridge has been rolled, tested, and inspected for surface defects, straightened, etc., and delivered to the shops, a question then arises, "What inspection should be made as the work progresses? This may be again divided into three parts—

First.—Riveted Members: Floor beams, stringers, chords, and end members; interior parts, struts, pedestals, and wall plates.

Second.—Forgings: Eye-bars, upset and eye-rods, clevises, and other blacksmith work.

Third.—Machine Work: Pins, rollers, turned bolts, etc.

It seems to be a disputed point whether the careful measurements usually made with a steel tape are necessary. For the finer measurements required in bridge work, the author uses for the purpose of checking to within one-eighth of an inch standard steel poles which are shop standards. This closed the written discussion, but the discussion was continued by calling on members known to have had long experience. Don J. Whittemore, a past president of the society and chief engineer of the Chicago, Milwaukee and St. Paul Railroad, was the first speaker.

He stated that he had been connected with this road for twenty-two years. That this company now controls 5,400 miles of railroads, 2,500 miles being acquired by purchase, and in this system there were 110 miles of bridges to be watched. There was also 12,000 culverts, which were designated by odd numbers, and the bridges by even numbers.

A book account was kept for each, giving date examined and condition; and when repairs are made a detailed account is given with cost. After twenty-two years of this careful attention to the structures on this road there has not been a single failure under a normal condition of service. The political engineer should never be appointed on a commission. Whenever he informed the directors that anything required attention the order would be to attend to it at once. If all roads having fair financial standing would follow this example accidents would be reduced to a minimum.

Mr. Theodore Cooper, of New York, an expert in bridge construction, was the next speaker. He stated that the danger of poor inspection was not with the first-class roads, but with those without responsible owners—with the latter the law should deal sharply. A theoretical and a practical man should examine every part of the structure. Inspection should be made on the bridge itself and not in the office. The young man sent out to be an inspector should be an old man. He preferred an outside guard-rail and a high one.

There are roads that object to high guard-rails, as they interfere with the snow-plough, when it will only cost them fifty dollars to change one to pass over a high guard-rail. Inspectors should be appointed. Every man should be held criminally responsible until they can show that a responsible person has been placed in charge. Criminal responsibility should begin at the top. The society as a body is not competent to decide a bridge question, but should be confined to the decision of experts only.

Edward S. Philbrick's paper was read by Mr. Croes. He stated that a State Board of Commissioners should be authorized to employ experts to examine and report upon the sufficiency of plans, etc.

Proper bridge inspection should include an examination of strain sheets, an examination of every member, and a search for any signs of depreciation. Prudence would make it necessary to anticipate probable future increase of weight of the rolling stock.

For all trunk lines a standard rolling load and wheel load, with axle distances for locomotives, could and should be adopted. A standard should be adopted for bridge-floors. Bridges with buckle-plate floors and continuous ballast afford the advantage of a more smooth and noiseless track and greater security from derailment, but are not to be recommended on account of concealed defect of rust.

Level crossings should not be allowed unless protected by interlocking signal.

Mr. Wellington read a paper prepared by J. M. Goodwin, of Sharpsville, Pa.

"The Ashtabula bridge was inspected periodically from the time of its erection up to the collapse, but this inspector looked with unappreciating eyes at conditions which, had he possessed the knowledge of a bridge specialist of the present day, would have induced him to carefully place himself outside of the bridge. The inspector was a boss carpenter. A 'cursory' inspection is one made from the rear platform of a running train." He favors the Latimer safety guard.

Stanley H. Goodwin, General Superintendent Lehigh Valley Railroad, stated that inspection of railroads should be controlled by the State government and not the

National. The inspection should include county bridges as well as railroad.

Mr. A. M. Wellington stated that "bridges should be built strong enough so as not to need inspection. The tendency of automatic coupling and train-brakes is to increase weight of train loads so that bridges will have to sustain more, and that will be an increase in the cost."

Mr. Roberts—"Inspection should begin as soon as contract is signed and continued to completion of the bridge."

Mr. C. C. Schneider, designer of the Niagara Cantilever bridge, thought that the best inspectors frequently were required to take a back seat.

Mr. Allen and Frederick Graff, Past President, also joined in the discussion.

Wm. Kent stated that the American Society of Mechanical Engineers appointed two committees of experts, one on standard pipe threads and the other on standard boiler tests, and since their reports were made a majority of the manufacturers have adopted them; he thought that the appointment of a committee on Bridge Inspection by the American Society of Civil Engineers would have a similar influence.

Robert I. Sloan, Chief Engineer of Manhattan R. R. Co., gave a description of the system of inspecting the elevated road in New York. The organization is as follows: One chief engineer and two assistant engineers who have charge of all construction and maintenance, which includes foundations, buildings, coal and water stations, tracks, track signals, and interlocking apparatus; one roadmaster, one assistant roadmaster, and one night roadmaster; four supervisors, one for each road; under each supervisor is a structure foreman in charge of a gang of men, who are employed either on construction or maintenance. The structure foreman has men who examine the rivets and trusses and have a section to go over every day.

There are also gangs employed on the track in charge of foremen: One on Second Avenue, two on Third Avenue, two on Sixth Avenue, and one on Ninth Avenue. There are fifty painters, who are required to report anything they may discover. There is also a street gang which attends to all foundations, and repairs of sidewalks.

The foremen report to the supervisors, supervisors report to roadmaster every night at South Ferry all defects found in structure or track. The roadmaster reports to the chief engineer every morning at 10 A. M. everything done the previous day or that has occurred. An expert engineer is also employed, who makes a personal examination every month, reporting monthly to the chief engineer. The chief engineer goes over a portion of the road daily. The description given by Mr. Sloan was interesting, as showing the apparently thorough inspection of the New York elevated railroad structures.

A paper was also read by J. M. Wilson, of Philadelphia. It was nearly 14 o'clock, or 2 P. M., when the morning session adjourned to meet at 16 o'clock.

At the afternoon session the first paper was by a German engineer who gave a description of his system for treating sewage with hot water to destroy all disease germs; his process was considered expensive for general application, costing two marks per cubic metre of sewage.

The next paper was a description of the "Operation and Results of a Single Expansion Steam-Engine Supplemented by the Evaporation and Expansion of the Bi-Sulphide of Carbon and its Vapors," by Charles H. Haswell, of New York, and read by the Secretary. He gave a description of the plant and a detailed account of experiments made. The writer's conclusions were: "Reviewing the elements submitted it is presented that by the use of the vapor of bi-sulphide of carbon in the vessel connected to an ordinary steam-boiler and engine it greatly exceeds both in pressure and volume the steam that generates it, and it is an evident and infallible consequent that an increase in power and economy of fuel is obtained with a less number of boilers and consequent wear."

Discussion followed on steel tapes and steel rods for use in bridge measurements, which was opened by J. B. Johnson, Professor of Civil Engineering, Washington University, St. Louis, Mo. He preferred the steel tape and thought that more accuracy could be obtained than by the use of steel rods. Mr. Wagner replied by stating that the expansion of a steel tape was greater than rods, being more quickly affected by changes of temperature, and the divisions on the tape are not sharp enough for accuracy. Professor Johnson's reply was that the University possessed a steel tape three hundred feet long which had become a standard. To illustrate, he stated that a base line had been measured near the Missouri River, the details of which are given in current reports of the War Department, which was measured four times with an error of only one in 1,000,000, and the difference in two measurements showed an error of only one in 3,000,000. Three thermometers were used, and the work was done on densely cloudy days. In reply to Mr. Flagg, he stated that there was but little difference between the expansion of steel and iron—for steel 0.000055, and for iron 0.000070.

To Mr. Collingwood's question, "How is the tape preserved?" he stated that it was wound on a reel eight inches in diameter; the width of tape was one-eighth of an inch, and area of section one two-hundredths.

One speaker thought the objection was in the great number of steel tapes necessary to contend with, and Mr. Croes replied by stating that this could be remedied by the manufacturer supplying the inspectors with a standard.

A member stated that he had much success in the use of rods made of black walnut, which had been treated by boiling in oil, but Mr. Johnson thought they would not do for extreme accuracy.

At 18 o'clock the afternoon session adjourned until 20:30 o'clock. Before the meeting adjourned Mr. W. G. Hamilton made the following announcement: Mr. President, at a meeting of the sister engineers of the society some solicitude (perhaps jealousy) was expressed at the white-hairedness, or bald-headedness, of the President and Past-President from too much brain-power, and feeling perhaps it might extend to the members generally (the committee, of course, being excepted), I ask permission to read the following communication:

"The engineers who have been cultivating their heads during the day are invited to meet in the ball-room immediately after the evening adjournment for the purpose of cultivating their heels, to thus maintain a balance of intellect. The ladies (who need no cultivating) are expected to be present to act as guard-rails to keep the members on the track. By order of the switch-tenders."

The following were appointed a committee of the exercises: President Worthen, Mr. Haskins, and Mr. Oberlin Smith.

The President's address was given in the evening, after which a "hop" was held.

JULY 4

A session was held to-day between 10:30 and 14 o'clock. The first paper read was a description of the locomotive "De Witt Clinton," by G. H. Thompson, engineer of bridges, N. Y. C. & H. R. R. The locomotive described was the third engine built by West Point Foundry Association, of New York City. The first engine (the Best Friend) exploded; the second engine was a failure; the De Witt Clinton a success.

The first passenger train of America was drawn by this locomotive August 31, 1831, over the Mohawk and Hudson R. R. (now the N. Y. C. & H. R. R.) from Lydia Street Depot, Albany, to Schenectady, seventeen miles distant. At Albany the ascent from Hudson River to Lydia Street was made by an inclined plane. The De Witt Clinton left Lydia Street in good condition, and continued the up-grade trip to a point half way from Albany, when she stopped. The line, which had thus far been straight, deflected at this point three-quarters of a degree; curves not being known then, she stopped to turn the angle, then proceeded to Schenectady in about one hour after leaving Albany. The engineer was David Matthews, a man still living and over 90 years old.

This paper contained a copy of a letter written by him, dated July 2, 1885, with date of trial and description of locomotive. A photograph of a drawing made of this locomotive by L. P. Hannas was presented with it. Mr. Matthews, in his letter, states that he "left North Moore Street, New York City, and was experimenting and fitting up tender, governor, and training him on the track till the 9th day of August, 1831, when I took the colt and gave the old boys a ride behind him over the hills to the Mohawk."

The chairman of the Committee on Compression of Cements, F. Collingwood, then made a report, which produced much discussion, on the manner of treating cement. D. J. Whittemore, Past President, stated that he had made about 1,500 tests on fourteen different brands of cement selected from both the East and West. These experiments showed that neat cements have less ultimate strength than when sand is added. Cement having low tensile strength will have increased ultimate strength when sand is added. He had used cement when the mercury was 2° above zero in building the pier of a drawbridge, the mortar freezing as built, but when the sun thawed the cement on southerly side it settled three-fourths of an inch. In about four months after, the frost came out of the north side, which settled to the same level, and pier is now in good condition. Mr. Collingwood and Mr. Worthen gave some experience. Mr. Noyes, Construction Engineer on Champlain Canal, stated that some experiments he made with a cement made in this state developed greatest strength when sand was added 1 to 1. Discussed by William J. McAlpine, F. C. Prindle, J. F. Flagg, J. Bogart, C. Tompkins, E. P. North, E. Kuichling, E. P. Clarke, P. P. Dickinson, and B. F. Church. A summary of the experience developed by this discussion would indicate that cement when frozen after being used, and exposed to the action of the sun, is affected, that its ultimate strength is weakened by the use of smooth sand, but increased by the use of sharp sand, whether fine or coarse, if thoroughly mixed. General Greene thought that no risk should be taken with frozen mortar in important work.

The next paper was a detailed description of the construction of Poughkeepsie Bridge by J. F. O'Rourke, engineer in charge of construction for Union Bridge Company. Sections and plans were presented. The paper was of much interest and designed to make the construction more easily understood to-morrow when a visit is to be made to it, having received a special invitation from the Union Bridge Company. The meeting adjourned until Wednesday.

In the afternoon a special business meeting was held for the purpose of raising a building improvement fund to be devoted to the improvement of the societies house in New York City, or to erect a building better adapted to the requirements of the society on some other site. It was decided to build an addition on the rear of the present building. A subscription was started and in less than an hour \$5,025 was raised.

In the evening the members attended a ball in the parlors of the hotel.

JULY 5.

A large number of the members left the Hotel Kaaterskill in the morning to visit the Poughkeepsie Bridge. They were taken from Roundout on boats provided by the Union Bridge Company to the bridge. Every portion of the bridge accessible was examined by them, and all were bountifully supplied with refreshments before returning, which was late in the evening. The members who remained at the hotel witnessed a severe mountain storm. The forenoon was misty, followed in the afternoon by a severe storm of both rain and wind. Only a little rain was seen by the members visiting the bridge.

Sessions were held on Wednesday and Thursday. At 9:30 on Thursday evening a banquet was served, covers being laid for 1,300 persons. Mr. W. G. Hamilton presided, and at 11 o'clock the first toast was given. The toasts were as follows: "The President of our Society, William E. Worthen, whose Happy Management of the Society is Crowning it with Laurels; Our Past President, General George S. Green, the Pioneer in Engineering," responded to by the Hon. W. J. McAlpine; "The Bright Side of Engineering," D. J. Whittemore; "Hydraulics," Frederick Graff; "The American Society of Civil Engineers," Theodore Cooper; "The Engineering Press," A. M. Wellington; "The Water-Supply of New York," B. S. Church; "Technical Education," R. E. McMath; "Our Sister Societies," J. F. Lewis; "Our Southern Members," J. Cohen; "Our State Improvements," John Bogart; "Our Foreign Guests," Henri Oesinger; "Our Treasurer," J. J. R. Croes; "The Ladies," Oberlin Smith.

During the course of the evening a display of fireworks was given under the direction of Pain & Son, of London, England. Among the set pieces was a locomotive crossing a trestle, which was fully appreciated. On Friday the members will visit the cement works of F. O. Norton.

[The report of the proceedings will be continued and completed in our next issue.]

IRON AND STEEL ANGLE-BARS.

Iron, in its report of the eighteenth annual meeting of the Iron and Steel Institute of Great Britain, which began on May 26, prints, among other things, an interesting and lengthy paper by Sir Bernhard Samuelson, entitled "Notes on the Terni Steel Works."

Mr. Samuelson, in speaking of a paper read before this body some time ago on the "Use of Steel in Naval Construction" by Sir Nathaniel Barnaby, then director of Naval Construction to the Admiralty, in which he drew attention to a peculiarity in steel angle-bars which distinguishes them from iron—i. e., when the end of a steel bar is cut off roughly and is left ragged, the leaves break off suddenly if struck heavily; whereas the other end of same bar, trimmed off evenly, will bear heavy sledging without rupture. Mr. Samuelson then goes on as follows:

"A rather startling case showing this liability to cracking or tearing across of steel came under my notice within the last week or two. A firm who purchased rolled steel from us recently ordered a quantity of bars 1½-inch in diameter of soft steel. The bars were rolled down in our works in the usual way from ingots 13 inches square, containing 0.14 per cent. of carbon. The parties purchasing the steel required them for colliery-tub axles, and in the course of manufacture they were cut into about 2-foot lengths, the two ends being drawn down in the smith's fire to one inch square for about three inches long to take the boss of the wheel. After smithing they were laid on a flat plate and generally straightened with a few light blows from a hammer. And now please mark what happened. A number of the axles broke in two, like a piece of glass. Naturally, a complaint was made to us that we had supplied steel of irregular quality. We felt certain that the quality was good, but went carefully to work to trace out the fault. In the first place we analyzed the broken pieces. This showed steel of good quality, there being nothing whatever abnormal about it, the carbon being 0.14 per cent. as intended. We then tried bending the pieces which had flown off on attempting to straighten the axles, and found that, without exception, they bent end to end without showing the slightest symptom of failure, and worked perfectly in the smith's fire, there being no sign of red-shortness; they also welded as usual. The cold fracture gave exactly the appearance which would be expected from steel of the temper indicated. On further investigating the matter, it was found that the whole of the fractured pieces could be bent round cold until the two ends touched, without the slightest indication of failure. It was evidently not that a few defective bars had been sent out in the bulk, but it was noticed that two axles from every bar failed. The matter became apparently more and more perplexing.

"Now for the elucidation of the mystery. By a very close examination of the surface of the bar at the point of frac-

ture, it was noticed that there appeared to be on one side a small portion filed across the bar. The whole of the fractures had taken place at this filed portion, and on no other portion of the bar was there any appearance of filing. Further investigation showed the fact to be that, whereas the bars were ordered without any brand upon them, the rollers at the mill had carelessly neglected their instructions, and had branded each bar in the usual way near each end. Having afterwards observed their mistake, they had slightly hammered down the surface of the bar, with the view of obliterating the brand, and then they had very slightly filed the surface where hammered across the bar. Every bar could be broken off short with the greatest ease by a blow or two in the vicinity of this filing. When an attempt was made to bend the bar with the filed portion on the outside of the bend, it always failed; but if the defaced brand was on the inside of the bend, no difficulty was experienced in making a close bend. And please note this further. When the defaced surface was heated and swaged slightly to obliterate the filing, and again slightly filled longitudinally, the bending could equally well be effected with the defaced portion on the outside of the bend. This experience was rather a startling one, as showing how sensitive a bar, or a piece of a homogeneous material like steel, is to a tearing action, if only a means of starting the tear exists. In this case, the slight nick or crack for the commencement of the tear was provided apparently by the defaced brands and scratches from the tooth of the file, the jarring or vibration from the hammering providing the further tearing action."

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

THE CONVENTION SEASON.

ELMIRA, N. Y., July 4, 1887.

SIR: Have just read your editorial on conventions. Though agreeing with you in the main, that the social feature is made too much of and that the "interchange of experiences" in the meetings does not take place, still ideas are suggested there, which are discussed by members after the meeting, and the interchange of experience does take place there, but does not get into the published pro-

This view will show you the method by which it was done. The pipe was lowered into the river by screws, which are too small to be seen in this photograph.

You will notice that the pipe vertically is an irregular line, being approximately the contour of the river-bed on which it was to lie. The trestles are rough horses, similar to those used by carpenters or plasterers. In the St. Joseph River the deepest water was 4 feet, and the current about three miles an hour. The horses were set and held by two men each. Then the 6x6 stick laid on them and a pipe rolled out to hold all in place. When the pipes were placed lengthwise of the trestles they were supported by 2x4's laid flat, enough being put under to support the pipe. The frame was immediately built over the pipe and the pipe slung in wire slings from the hook below the screw. When all was in place across the river the pipe was lifted from the 2x4's and lowered as Mr. Coates describes in his paper.

If you should publish this cut it is so near that described by Mr. Coates, I think your readers would better understand Mr. Coates' description.

Mr. Coates was in Elkhart one or more times in 1884.

We had used this method at New Castle, Pa., two years previous to this, but we never supposed it a sufficient novelty to write a description of it.

Yours very truly, J. H. HARLOW & Co.

AN ELECTRIC YACHT.

NEWBURG, June 23.—At a shipyard here there is being constructed the first vessel to be propelled by electricity ever built in the United States. It is a yacht 37 feet long, 7 feet wide, and 5 feet deep. It is to be run by stored electricity. It is building for a Newark (N. J.) electric company, and will run between that city and New York. Vessels of this kind have been built in England, but never before in the United States.—*New York Herald*.

THE Rapid Transit Commission of New York City has refused to allow the proposed additional elevated railway routes place their "loop" on the Battery.

THE Water-Board of Newark, N. J., has ordered an investigation into the charges of mismanagement against the board which have been made in the press.

DEATH OF JACKSON BAILEY.

JACKSON BAILEY, editor and one of the founders of the *American Machinist*, died at his home in Brooklyn, N. Y., Thursday, July 7, in the forty-first year of his age.

Born at Schenectady, N. Y., May 12, 1847, Mr. Bailey enlisted as a private in the 134th Regiment of New York Infantry at the age of fifteen, and served three years to the close of the war. He was at Missionary Ridge and in several other battles, and served in Sherman's army during the march to the sea.

Mustered out of service at eighteen years of age, he graduated from the State Normal School at Albany, N. Y., and afterward was engaged in teaching. Later on he connected himself with a New York publishing firm, which position he relinquished to become New York representative of the *American Manufacturer and Iron World*, of Pittsburgh.

In November, 1877, he joined Horace B. Miller, under the firm name of Miller & Bailey, in establishing the *American Machinist*. The paper was successful from the start, and Mr. Bailey retained his connection with it up to the time of his death, though his failing health during the past two years had, during a considerable portion of that time, rendered him unable to do active work. His disease was of malarial origin and developed into consumption of the bowels. He leaves a widow, but no children.

At the time of his death Mr. Bailey was First Vice-President of the New York Press Club and a member of a number of engineering societies.

Mr. Bailey was a high-minded, conscientious man who won the esteem and confidence of those who came in contact with him.

PERSONAL.

MAYOR HEWITT, of this city, has appointed Peter B. Olney, General Louis Fitzgerald, Stevenson Towle, Thomas C. Clark, and James B. Smith Rapid Transit Commissioners to lay out new routes in accordance with a petition of householders, which was filed in the Mayor's office May 30.

THE death is reported by cable of General Ruhard, Chief Engineer of the French Ministry of War.

P. E. LE FEVRE, U. S. N., has been appointed Superintending Engineer of the Ocean Steamship Company, with station in New York City.

MAYOR HEWITT has appointed Dr. Joseph D. Bryant as Health Commissioner of New York City. Dr. Bryant was born in Wisconsin about forty-two years ago, and was educated in Norwich, Conn., afterwards graduating from Bellevue Hospital Medical College.

Dr. Bryant was appointed Sanitary Inspector in the New York City Health Department in 1873; resigning after six years' of service to accept the professorship of surgery at Bellevue Hospital Medical College, which position he still holds. Dr. Bryant is also Surgeon-General on Governor Hill's staff.

PAST ASSISTANT ENGINEER JOHN A. TOBIN, U. S. N., has been appointed by the President Superintendent of the Building for State, War, and Navy Departments in Washington.

CAPTAIN SAMUEL P. GRIFFIN, formerly of the U. S. Navy, and for some years past superintending a contract on the Panama Canal, died at Aspinwall, on the Isthmus, July 4, aged 61 years.

CHRISTIAN E. DETMOLD, architect and engineer of the Crystal Palace in New York, died in this city July 9, aged 78 years. Mr. Detmold was originally a railroad engineer, and built the Charleston and Hamburg Railroad in South Carolina, one of the earliest railroads in this country.

MR. GEORGE S. RICE, M. Am. Soc. C. E., has been appointed Deputy Chief Engineer to the Croton Aqueduct Commission of this city. Mr. Rice is at present a resident of Boston. He was at one time connected with the Lowell Water-Works, and since 1881 has been a mining engineer in Colorado and Arizona. Mr. Rice was also connected with the Boston Main Drainage Works.

THE death of Franklin Cook, C. E., a member of the Engineers' Club of Minneapolis, is reported.

ceedings. I account for this on the ground that these men are mostly practical men, who are unused to expressing their ideas in public meetings, but who, in gatherings outside the regular sessions, can and do impart a great deal of valuable information.

To those who rely on the published reports, I suggest a trial attendance on one of the annual conventions, with every confidence that they will feel amply repaid, not only in the rest and enjoyment, but also in actual information received. This has been my experience.

Yours truly,

A MEMBER AM. WATER-WORKS ASSN.

[We did not intend to convey the impression drawn by our correspondent from the article referred to, and we do not think it can be so interpreted.—Ed.]

CARRYING WATER-MAINS ACROSS A RIVER.

JAMES H. HARLOW & Co.,

Engineers and Contractors,

411 WOOD STREET, PITTSBURG, June 23, 1887.

SIR: In your issue of June 18, I see an article by W. R. Coates, on "Carrying Water-Mains across a River." Enclosed please find photographic view of 12-inch pipe laid across the St. Joseph River, at Elkhart, Ind., in the summer of 1884, by George R. Harlow.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

J. L. Bass, of Rome, Geo., solicits correspondence with architects with a view to obtaining specifications and estimates for a new hotel for which \$100,000 has been raised.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 146-147-148.

WATER, SEWERAGE, ETC.

TUSCALOOSA, ALA.—The American Water-Works and Guarantee Company, of Pittsburgh, Pa., will make a proposition for the building of works here.

ALBANY, GEO.—Address J. G. Stephen in regard to the company which will build water-works and a street railroad here.

FLORENCE, ALA.—The American Water-Works and Guarantee Company, of Pittsburgh, Pa., have made propositions to construct water-works here.

MECHANICSTOWN, MD.—The Mechanicstown Water Company will build the water-works here.

GOWANDA, N. Y.—Bassett Bros. and Hardicke & Ware are contractors for reservoir and pipe. Both firms are from Buffalo.

NEW HARTFORD, N. Y.—The question of obtaining water-works is again discussed here.

FINDLAY, O., will vote, July 19, on the question of establishing water-works.

AUSTIN, MINN., has voted in favor of building water-works; estimated cost, \$25,000. Mayor French can give further information.

NORTH PLATTE, NEB.—Plans for water-works are being prepared.

BIRD CITY, KAN., has voted in favor of establishing water-works.

THOMASVILLE, GEO.—C. H. Williams will receive proposals for constructing a water-tower seventy feet high, with iron tank 25'x30' on top.

EDEN, ME.—Town meeting, June 30, voted to raise \$60,000 to complete the sewerage system.

DOWNS, KAN., has voted to raise \$30,000 of bonds for water-works.

EAST OAKLAND.—The Contra Costa Water Company will build two reservoirs.

CRETE, NEB.—See our Proposal Column for water-works here.

CHARLES CITY, IOWA.—Bids for the construction of water-works here will be opened July 20. A. A. Richardson, of Lincoln, Neb., is the consulting engineer.

VALPARAISO, NEB.—Proposals for building water-works will be opened July 30. Plans are by A. A. Richardson, C. E., of Lincoln, Neb.

YORKVILLE, ILL.—The contract for water-works has been let to George C. Morgan. The works are to be completed by November 1.

BRANTFORD, ONT., is looking for sources of water-supply.

KINGSTON, ONT.—The city has bought the works of the company at \$120,000.

AUSTIN, MINN.—Town meeting has voted in favor of expending \$25,000 on a water-works plant.

TRENTON, N. J., is preparing to construct some large sewers. A hearing will be held July 19.

GREENSBORO, N. C., wants proposals for water-works.

GRAND RAPIDS, MICH., is agitating for additional water-supply, including more water mains.

PLYMOUTH, MASS., will replace 2-inch iron mains with 4-inch.

CARBY, O.—Our correspondent writes: "There is no movement in the line of water-works as yet—at least nothing positive. There was some talk, but the matter has dropped."

LOS ANGELES, CAL.—The Pacific Water Company has been incorporated at Los Angeles by H. H. Markham, of Pasadena; F. L. Raymond, of San Gabriel; N. Vandervliet, of Santa Ana; L. W. Dennis, C. H. Bradley, of Los Angeles. The company will acquire water rights, etc., and sell water in the San Gabriel Valley, or the San Pascual or Santa Anita Ranches.

LEWISTON, ILL.—A town meeting has voted in favor of putting in water-works; also of electric-lights.

LITTLE FALLS, N. Y.—A dam will be built at the upper end of Loomis Island. Stephen E. Babcock is in charge.

MACON, GEO.—The city has made a contract with the Macon Gas and Water Company for two years for a supply of water.

VAN BUREN, ARK.—The Water and Light Company, of St. Louis, has made a contract to build water-works here.

MEMPHIS, TENN.—Organized is the Artesian Water Company; R. C. Graves, President; John J. Welles, Secretary.

WASHINGTON, GEO.—has a bill before the State Legislature providing for the raising of \$10,000 to build water-works.

MACON, GEO.—The Central City Water-Works Company has a bill for articles of incorporation before the State Legislature.

MILLEGAVILLE, GEO.—Water-works will be built here. Address Samuel Walker.

TUSCALOOSA, ALA.—Address the Tuscaloosa Coal, Iron, and Gas Company about water-works.

PAINESVILLE, O.—Address H. P. Sanford, City Engineer, in regard to sewers.

SOUTH WILLIAMSPORT, PA., will have water-works on plans by W. R. Coates, C. E., of Kalamazoo, Mich.

COLUMBIA, MO., will build water-works after plans by W. R. Coates, C. E., of Kalamazoo, Mich.

HAMILTON, O.—The National Water-Supply Company, of Cincinnati, has contracted to put in a set of driven wells at \$9,000.

RUSHFORD, MINN., will have water-works.

HUDSON, WIS.—Water-works will be built; \$20,000 have been raised for them.

BUTTE, MONT.—The Silver Bow Water Company will build works here.

MALDEN, MASS.—Plans are being prepared for a high-service water-supply.

ENGLEWOOD, N. J.—This evening the recently incorporated Englewood Sewerage Company will complete its organization by the election of officers and directors. The capital stock is \$50,000, of which \$20,000 is already paid in. The purpose of the company is to provide sewerage for Englewood; its charter also allowing the company to carry out the drainage of wet lands. The number of stockholders is about 85, nearly all of whom are residents of Englewood. Among them are Jacob S. Wetmore, Donald McKay, R. H. Rochester, and George W. Betts. The plans for the work are not yet decided upon, and will not be until the engineer is selected to design them, but it is expected that about five miles of pipe-sewers will be laid. The discharge will be in Peck Creek, a tidal way branch of the Hackensack River. It is expected that work will begin in the fall. The sewers being owned by a private company, it is presumed that a charge, *pro rata*, of the value of the property, will be made for connection with them. A water-supply system constructed by the Hackensack Water Company (reorganized), which furnishes the water, will be completed by September 1, which will necessitate the speedy introduction of sewerage.

WELLSVILLE, O.—A report on sewerage will be made by Surveyor George.

COVINGTON, KY.—The trustees of the water-works decline to make public the bids for constructing a reservoir.

PETERSBURG, ILL.—At a special election held July 2, it was decided to issue bonds to the amount of \$18,000 for the construction of city water-works.

KAUKAUNA, WIS., is receiving propositions for the building of water-works.

READING, PA.—The Water Board recommends to City Council an appropriation of funds to purchase two Hyatt filters with a capacity of 1,000,000 gallons of water daily.

MANKATO, MINN.—F. S. Blodgett, Consulting Engineer, has approved the plans already made for a sewerage system. City Council have not yet definitely voted, and meantime the Lowell system has been presented to their consideration.

SANTA FE, N. M.—The Rio Grande Land Company, of this city, is a new incorporation, backed by the Atchison, Topeka and Santa Fe Railroad Company, to construct irrigating canals, develop towns, construct water and gas works, etc. H. L. Waldo, of Santa Fe, is President; A. S. Johnson, of Topeka, Kan., is Secretary.

GENEVA, N. Y.—The Water-Works Company has decided to purchase new pumping engines having a capacity of 2,000,000 gallons daily.

ST. CLOUD, MINN.—There is a proposition to sell the water-works of the city.

DULUTH.—The gas and water company have just begun the past week improvements to cost \$125,000.

LITTLE FALLS, MINN.—A special election results in overwhelming vote favoring extensive improvements in the water-power at this point.

WEST HOBOKEN, N. J.—Bids for sewers were opened by Town Council July 6, but no action was taken. The total cost is estimated at \$67,000. The individual bids were not given out.

LOS ANGELES, CAL.—The Pacific Water Company has been incorporated at Los Angeles by H. H. Markham, L. W. Dennis, Nelson Vandervliet, C. H. Bradley.

SANTA BARBARA, CAL.—The Santa Barbara Water, Land and Cinnabar Company has been incorporated by D. H. Jones, George W. Miller, E. J. Ryan, S. P. Platt, M. H. Gibson.

BRIDGETON, N. J.—City Council has approved the contract with J. H. Haines, of Cape May, for sinking a well at the water-works to cost \$4,000.

GRAND RAPIDS, MICH.—Hydraulic Company will build a steel stand-pipe, 30x100 feet.

ALBANY, N. Y.—The contract with Andrews Bros., of New York, for a daily supply of 10,000,000 gallons of water at \$237,000, has been ratified.

SYRACUSE.—Turner, Clark & Rawson, of Boston, are organizing a company to submit a proposition to the city for furnishing a supply of water. They propose to take the water from the east branch of the Salmon River.

BIRMINGHAM, ALA.—City Engineer Carter is advertising for proposals for a brick sewer about one mile in length, and requiring 3,000,000 bricks.

RALEIGH, N. C., asks for correspondence with C. G. Lalla, Chairman of the Committee of Aldermen on Sewerage, on the subject of constructing a sewerage system.

SHANEAULES, N. Y.—The Shaneteles Water-Works Company, on July 5, was granted, at a special meeting of the Board of Trustees, a franchise for laying mains and supplying the village with water. The conditions are that the works shall be in operation within two years from December next, and that the company shall not charge the village more than \$40 a year for every hydrant used by the village, and that the company shall not sell the franchise to any non-residents of the village.

PROVIDENCE, R. I.—The Board of Public Works will obtain plans and specifications for a reservoir on Fruit Hill, to cost about \$50,000.

PORTSMOUTH, VA., is still receiving propositions from water projectors.

MT. HOLLY, N. J., is taking steps to obtain better water.

SANFORD, FLORIDA.—The Water Company will put in new pumping machinery and lay larger mains. The cost of improvements will be about \$75,000.

DALLAS, TEXAS.—The Oak Cliff Water-Supply Company has been chartered with a capital of \$50,000. For information address T. L. Marsalis and Thomas Field.

WEATHERFORD, TEXAS, and Pochontas, Va., are reported as wanting water-works.

SANTA ANA.—A syndicate has been formed to supply the city with water.

NEWBURG, N. Y.—The City Engineer advertises until July 19 for proposals for a 15-inch sewer.

CHESTER, PA.—On July 7 the formal transfer of the South Ward Water-Works to the Chester Water Company was made, which will complete the plant as soon as possible. Reservoirs will be built on Harrison's Hill.

LANCASTER, PA.—On July 6 Councils received a supplementary report from J. J. R. Croes, M. Am. Soc. C. E., of New York City, on improving the water-supply, presenting two plans, costing \$79,131 and \$81,131, respectively.

HIAWATHA, KAN.—This town is now putting in water-works. J. F. Grimes will give information of the progress of the work, etc.

HANOVER, N. H.—On July 6 the Special Water Committee reported in favor of introducing a gravity system of water-supply at a cost of \$35,000. They were instructed to confer with the authorities of Dartmouth College, to ascertain what share of the expense the college will bear, and then to secure legislation necessary to undertake the scheme.

GERMANTOWN, MASS.—Twelve-inch iron pipe will be laid to furnish water-supply to this suburb of Boston.

WHITMAN, MASS.—The town will hold a special town meeting to decide upon the purchase of pumping-engines and water-mains for the new water-supply.

MALDEN, MASS.—The Mayor and Aldermen are prospecting for sources of water-supply. Bear's Hill, in Reading, is proposed, the cost of reservoir and mains being estimated at \$350,000.

GAS, STEAM, BUILDINGS, ETC.

FAIRMOUNT, W. VA.—Address H. S. Sands about an electric-light plant to be erected here.

KNOXVILLE, TENN.—R. N. Hood and others have formed a company to bore for natural-gas.

MACON, GEO.—Incorporated is the Consumers' Gas-Light Company of this city; Jesse W. Starr, of Philadelphia, H. H. Horne, T. J. Carling, S. Weichsellaw, of Macon, incorporators; capital \$125,000. New works will be built.

INCORPORATIONS IN NEW HAMPSHIRE.—Among the bills which have passed the State Legislature are the following: Act to incorporate the White Mountain Telephone Company; act to amend an act to incorporate Dover Gas-Light Company; act in amendment of an act to incorporate Keene Gas-Light Company.

HYDE PARK, ILL.—Incorporated is the Hyde Park Electric Light Company; capital, \$250,000; Hugo Hofman, Louis Schwab, George N. W. Clark incorporators.

SAN FRANCISCO, CAL.—Incorporated is the Natural Gas and Mineral Development Company; J. B. Southard, F. W. Bean, David McClure, and others incorporators.

HUNTSVILLE, MO., wants proposals for sinking a well. Address W. T. Rutherford.

CHICAGO.—Incorporated is the Chicago Natural-Gas, Fuel, and Light Company; incorporators, Charles Goodwin, John G. Schurz, R. A. Wade, A. H. Armour, John T. Nichols, S. R. Burke, and George C. Armstrong.

CHICAGO.—A city ordinance is under consideration, which authorizes the Commissioner of Public Works to advertise for electric lights for the river front.

CHICAGO.—The city has decided to purchase the necessary plant for electric lights on the bridges.

OAKLAND, CAL.—Articles of incorporation have been filed at Oakland, of the Roe Electric System Company, with Julius Jacobs, A. P. Brayton, J. H. Roe, George C. Perkins, and William Alfor as directors. The capital stock is \$100,000.

LYONS, N. Y.—The Thomson-Houston Electric-Light Company will erect a plant for lighting this town.

ERIE, PA.—Organized is the Presque Isle Natural-Gas Company; J. F. Downing, M. Griswold, W. A. Galbraith, and others, directors.

AUSTIN, TEXAS.—The City Water Company and the Austin Electric-Light Company have consolidated under the name of Austin Water, Light, and Power Company. The electric-light plant will be enlarged.

SHERMAN, TEX.—The Sherman Electric Light and Power Co. will enlarge its plant.

RAILROADS, BRIDGES, CANALS.

BRIDGE CONTRACTS.—The Berlin, Conn., Bridge Co. has been awarded the contract to build an iron bridge across Little River at Seymour.

Baker & Pittman, of Thomasville, Geo., have been awarded the contract for the bridging of the South Florida and Georgia Railroad.

The Detroit Bridge Company has been awarded the contract to build an iron bridge over the Scioto River at Chillicothe, O.

RAILROADS.—The Arizona Valley Street Railroad Co., of Los Angeles, Cal., has been incorporated; J. S. Phillips, J. F. Humphreys, C. H. Ward, and Eugene Riggins.

The Great Bend, Water Valley and Western Railroad Company, of Great Bend, Kan., has been incorporated; C. W. McDonald, Concordia; Ira Lloyd, Ellsworth; A. M. Lasley, Lyons; G. W. Nimocks and others.

The Red Cloud, Kirwin and South-western Railroad Company, of Kirwin, Kan., has been incorporated; D. Dodge, H. Moulton, W. T. Belford, M. H. Johnson and others.

The Garfield, Pawnee Valley and Colorado Railroad Company, of Topeka, Kan., has been incorporated; G. W. Nimocks, D. N. Heizer, Great Bend; A. J. Hoisington, Garden City; R. M. Spivey, Newton; and P. D. Terry, Terrytown, incorporators.

RAILROAD.—The Pittsburg, Baxter Springs, and Galveston Railway Company has been incorporated at Baxter Springs, Kan., to build a railroad from Pittsburg, Tex., to Baxter. Charles M. Daniels, John M. Cooper, and others are directors. The capital stock is \$250,000.

RAILROADS.—Bills will be introduced in the Georgia State Legislature to charter the Augusta, Thomasville and Gulf Railroad Company, and the Augusta, Gibson and Sandersville Railroad Company.

RAILROAD.—The Nashville, Florence, and Sheffield Railroad Company is taking measures to raise money for completing the line. A meeting will be held at Columbia, Tenn., July 25. M. H. Smith is President.

WELLINGTON, KAN.—Eastern capitalists have made an agreement with the local officers of the Fort Smith, Wellington and North-western Railroad to build roads. Bonds have been voted from Arkansas City to Russell, Kan., aggregating \$724,000. John Murphy is president of the road.

MARYSVILLE, KAN.—Marysville township has voted \$30,000 in bonds to the Chicago, Omaha and South-western Railroad. Richland Township has voted \$20,000, and Waterville township the same. This insures the building of the road. Work will commence at Marysville within sixty days.

ST. JOSEPH, MO.—The Wyatt Park Railway Company has been incorporated with \$500,000 capital. The incorporators are business men of this city and Holt, Andrews, Atchison, and Nowaday counties. The line will be four miles long, and be run from the central portion of the city to the Wyatt park, southeast of the city.

CONCORD, N. H.—It is proposed to extend the line of the Dover, N. H., and Winnisseeogee Railroad to Lake Village and Laconia.

DES MOINES, IOWA.—The Southside Viaduct Company has been incorporated to build viaducts; C. L. Watrous is president.

LINCOLN, NEB.—Articles of incorporation of the Lincoln and Black Hills Railroad Company have been filed in the office of the Secretary of State. The principal place of transacting business will be at Central City, Neb. The company was incorporated by G. Holdridge, president, and J. G. Taylor, secretary.

MILWAUKEE, WIS.—The capital stock of the Milwaukee Cable Railway Company, \$300,000, has been subscribed and the following officers elected: President, F. E. Hinkley; Vice-President, J. A. Hiney; Secretary and Treasurer, R. E. Graves; H. W. McNeill, manager; Directors, John A. Hiney, William P. McLaren, F. E. Hinkley, H. W. McNeill, and R. E. Graves. Work will soon begin.

ALEXANDRIA, LA.—The Louisiana and Arkansas Railroad will be built soon.

BRIDGES.—The contract for building two highway bridges at Almonte, Ontario, Canada, have been awarded to George Bradford, for the masonry work, \$6,480, and to the Dominion Bridge Company, for the iron work, \$10,945.50.

COLUMBUS, O.—The contract for an iron bridge over the Scioto River, at this place, has been given to the Columbus Bridge Company at \$21,000. It has a span of 2,060 feet.

RAILROADS.—Incorporated at Springfield, Ill., are Richards' Elevated Railway Company, of Chicago, to construct elevated railways in the city of Chicago and adjacent territory, the same to be operated by steam, electric, cable, or other power; incorporators, Harry A. Richards, John J. Healy, and Frederick Ahlschlaeger. Also the South Chicago and West Shore Railroad Company. It is proposed to build the railway from some point in Section 5, Township 37, N. R. 15, east, third P. M., in Cook County, Ill., in a south-westerly direction to Dalton, in the same county, with a branch from some point in Section 19 to Hegewisch. The principal business office is to be in Chicago. The following residents of Hyde Park are the incorporators, and also the first Board of Directors: George W. Spencer, John B. Warren, Gideon L. Barber, Frederick W. Green, and George Willard.

PLATTSBURG, N. Y.—It is expected that the Chateaugay Railroad will be extended twenty miles to the lower Saranac Falls.

KEOKUK, IOWA.—The Atchison, Topeka, and Santa Fe Railroad will be extended to this city. The city will purchase the right of way. Freight and passenger depots will be built, to cost about \$20,000.

BRIDGE.—The plans of George W. Catt, Bridge Engineer of the San Francisco Bridge Company, have been accepted by the Illinois Central, for a \$2,000,000 bridge across the Ohio River at Cairo, Ill.

PALATKA, FLA.—Address Col. S. B. Cyster in regard to a railroad bridge to be constructed near here.

ALBION, ORG.—George C. Morrison is engineer of the bridge which is to be built here.

WINNIPEG.—The contract for the construction of the Red River Valley Railroad from Winnipeg to Pembina was signed June 30, and work will commence at once.

JERSEY CITY, N. J.—The Committee on Bridges will have plans and specifications prepared for an iron bridge over the Morris Canal at Claremont.

NEW YORK CITY.—The Park Commissioners have decided to fill in the low ground at Eighty-sixth and Eighty-seventh Streets on the Riverside Drive. The engineers' estimate of cost is \$36,000.

MILWAUKEE, WIS.—The Milwaukee and Northern R. Co., June 30, let the contract for building ten miles of railroad from Republic to the Champion mine to Harrison & Green. The work will be begun at once and completed this fall.

DETROIT, MICH.—Address the Michigan Central Railroad, at this city, in regard to the proposed bridge at Fort Street which the city desires built.

BIRMINGHAM, ALA.—The engineers are at work laying out the line of the Birmingham and Atlantic Railroad. Dr. J. A. West is manager.

SPRINGFIELD, ILL.—Articles of incorporation were recorded in the office of the Secretary of State June 30 of the Chicago and State Line Railroad Company. It is proposed to run a railroad from a point on the line between the States of Indiana and Illinois at the intersection of the New York, Chicago and St. Louis Railway Company to the city of Chicago. The principal business office will be at Chicago. The Board of Directors are as follows: William K. Vanderbilt, James A. Roosevelt, and John S. Kennedy, of New York; John Newell, A. G. Amesden, P. S. Blodgett, Pliny B. Smith, and N. A. Skinner, of Chicago.

LEBANON, PA.—It is reported that Robert A. Coleman, of Cornwall, Pa., will construct a railroad from Lebanon to Reading, twenty-eight miles, at a cost of about \$1,000,000.

THOMASVILLE, GEO.—Engineers are surveying the line of the Thomasville and Tallahassee Railroad. Contracts for grading will soon be made.

FINDLAY, O.—Incorporated is the New York, Mahoning and Western Railroad, of Findlay. The road is to run from Youngstown to Van Wert. The incorporators are Ben Le Fevre, O. P. Rony, L. M. Schwan, E. R. Chapman, C. W. Haskell, W. I. Reed, and W. W. Sutton.

RAILROAD INCORPORATIONS.—The Cincinnati Burnet Woods, Clifton and Cummins Street Railroad Company, Cincinnati, O.; Thomas Morrison and others, incorporators.

The Clay Center City Railway Company, Clay Center, Kan.; George F. Parmelee, and others, incorporators.

The Muncie City Railway Company, Muncie, Ind.; W. W. Ball and others, incorporators.

The Third Street Railroad Company, Newburg, N. Y.; Cornelius L. Waring and others, incorporators.

The St. Paul, Minn., Belt Railroad Company; Edmund Rice and others, incorporators.

The Chattanooga, Tenn., Southern Railway Company; W. Crutcher and others, incorporators.

HELENA, MONT.—The Butte and Ruby Valley Railroad Company has been incorporated by H. Elling, William W. Morris, A. J. Davis, H. Knowles, D. McCranor, S. Ward, W. A. Clark. Capital stock, \$1,000,000.

OSHKOSH, WIS.—There is a proposition under discussion looking to the construction of a boulevard along the lake shore, at a cost of \$100,000.

COUNCIL BLUFFS, IOWA.—The Council Bluffs and Omaha Wagon Bridge Company will build a bridge over the Mississippi River.

WASHINGTON, D. C.—Colonel Peter C. Hains will soon advertise for proposals for constructing the bridge across the eastern branch of the Potomac River. The cost will be about \$100,000.

PORTLAND, ORE.—The Portland Cable Road Company has been incorporated at Portland by T. G. Murphy, A. W. Wright, Jr., J. C. McCaffery, Joseph B. Thompson. A road is to be built to Portland Heights.

LOS ANGELES, CAL.—The Los Angeles County Railroad Company has been incorporated by M. L. Weeks, R. C. Shaw, O. C. Rounds, J. S. Miller, E. C. Burlingham. The road will be from Los Angeles to the Pacific Ocean at the Bay of Santa Monica, a distance of twenty-eight miles.

RAILROAD. Address Dr. Oille, of St. Catharines, Ont., in regard to the Niagara Central Railroad.

BOSTON.—The Bridge Commissioners will advertise for proposals for stone-work for the Harrow Bridge, about July 14.

ST. PAUL.—The South St. Paul Rapid Transit Company have closed a contract with the Daft Electric Light Company, of New York, to furnish the electric plant for their proposed line of road. Mr. B. F. Hamilton, chief engineer of the Enos Electric Railway Company, is in the city and will superintend the construction.

MINNEAPOLIS, MINN.—The Minnesota Belt Line Railway and Transfer Company has filed articles of incorporation. The incorporators are: W. D. Washburn, R. B. Langdon, L. E. Fletcher, John Crosby, W. S. King, George A. Brackett, J. S. Pillsbury, and W. H. Eustis. The capital stock of the company is \$1,000,000.

BIDS OPENED.

CLEVELAND, O.—Bids for the Union Mills school-house have been rejected. Bids will be accepted and

contracts made for the 16-room building on Scranton and Viga Avenues: Mason work, Kirkheim & Schenk, \$15,946; cut stone, John Barclay, \$4,950; carpenter work, John Rochford, \$14,025; lath and plaster, Thomas Tarbet, \$1,875; galvanized iron work, C. W. Steon, \$950.52; iron work, T. H. Brooks & Co., \$354.20; painting, M. T. Polcar, \$1,037; slating, Auld & Conger, \$2,224; heating, Isaac D. Smead & Co., \$5,700; plumbing, Paine & Henderson, \$24,950; sewer, Clements Brothers, \$1,444; total, \$50,652.02.

CHICAGO, ILL.—Bids were opened July 1 for building a crib-work around the lake-crib. The bids were as follows: O. B. Green & Co., \$153,079; Fitzsimons & Connell, \$147,794 and \$143,394; and H. B. Herr & Co., \$126,246. No award was made, and the probabilities are in favor of the "improvement" being abandoned on account of cost.

COLUMBUS, O.—The City Civil Engineer has awarded contracts to N. B. Abbott for laying a West Virginia fire-clay brick pavement on Fourth Street from Town Street to Naghten Street.

DETROIT, MICH.—The Board of Public Works has received the following bids for constructing a bridge over the Detroit River from the mainland to Belle Isle Park: King Iron and Bridge Manufacturing Company, Cleveland, \$350,000; Milwaukee B. & I. Works, Milwaukee, \$287,000; Mt. Vernon Bridge Company, Mt. Vernon, O., \$281,000; Detroit B. & I. Works, Detroit, \$280,000.

NEW YORK CITY.—Bids were opened as follows at the Department of Docks on Friday, July 1, for preparing and building a crib-work bulkhead at the foot of East 76th Street, East River: John D. Gillis, \$35,000; W. Danforth, \$48,066.

BROOKLYN.—On July 5 the Board of Education opened bids for heating apparatus in certain schools as follows:

Rutler & Blake, two boilers for the Lafayette Avenue school, \$1,472; two boilers for the Butler Street and Vanderbilt Avenue school, \$1,472; boilers for the Wilson Street school, No. 16, \$828; two upright boilers for the Lafayette Avenue school, \$1,067; two upright boilers for the Butler Street and Vanderbilt Avenue school, \$1,067; upright boilers for the Wilson Street school, No. 16, \$684; for heating and ventilating apparatus for school No. 16, \$5,932; for heating and ventilating apparatus for the Butler Street and Vanderbilt Avenue school, \$6,486. The bids were referred to the Committee on Heating and Ventilating for examination and report.

Chairman Harkness, of the School-house Committee, reported the receipt of but one proposal for an iron stairway for the Patchen Avenue school, that of Poulson & Eger, \$1,738. On motion the bid was rejected on the ground that there had been no competition and the committee ordered to "advertise for proposals."

ST. PAUL.—The Court-house Commission has opened the following bids for work on the new court-house: Plastering: James Cullen, \$23,549; James Wilson, \$16,775; Oliver J. Firth & Co., \$25,785; Norris & Reaney, \$32,700; Doyle & Beattie, \$18,956; George Hanley, \$28,775; Matt Breen, \$34,000; Joseph Eastman, \$21,747; M. H. Ward & Co., \$10,581; J. P. Adamson & Co., \$9,600; Prendergast Bros., \$13,500; P. V. Dwyer & Bros., \$11,500; Hudner & Regelsberger, \$10,975.

Fire-proofing: Minnesota Terra Cotta Lumber Co., \$32,443; Gregg & Griswold, \$25,950; Matt Breen, \$27,500; Pioneer Fire-Proofing Co., \$32,000; Western Fire-Proofing Co., \$39,500; Wright Fire-Proofing Co., \$33,900.

PHILADELPHIA.—Bids have been opened at the Survey Department for the construction of main and branch sewers. The bids for the main sewers were as follows: For a continuation of the Mill Creek sewer along Meadow Street, 20 feet in diameter: W. H. H. Achuff, \$62; James Deehan, \$68; John P. Dutton, \$65; H. P. McTague, \$66.90; John McParland, \$63; John B. Foster, \$83.50; Peter Deehard, \$59.75; and Michael O'Rourke, \$72 per linear foot.

For a 15-foot main sewer on Forty-seventh Street from Mill Creek to Haverford Street, the bidders were: W. H. H. Achuff, \$30.75 per linear foot; James Deehan, \$42.85; J. P. Dutton, \$42; John Noondy, \$40.50; H. P. McTague, \$54.90; John McParland, \$47; J. B. Foster, \$53; P. Deehan, \$47.50; M. O'Rourke, \$49 per linear foot.

For a sewer on Herskell Street, north of Mill Street, in three sections of 9 feet, 8½ feet, and 4 feet in diameter, the bids were: W. H. H. Achuff, \$40, \$40, \$20; James Deehan, \$40, \$38, \$20; John P. Dutton, \$28, \$26, \$10; H. P. McTague, \$28.75, \$28.35, \$10; \$43.90, \$36.87, \$6; M. C. Hong, \$27.50, \$27.75, \$10.75; P. Deehan, \$31.80, \$27.80, \$7.90; M. O'Rourke, \$26, \$26, \$26, respectively.

For a 4x3 sewer on Eagle and Price Streets, the bids were: \$17.75, \$20, \$21.37 per linear foot.

For a 3½x2½-foot sewer in Wissahickon Valley the bids were \$9, \$11.85, \$9.74, \$14.37 and \$10 per linear foot.

For a continuation of the Manayunk intercepting sewer in three sections for the street of 9-inch brick 2½x3½ feet, the bids were: James Deehan, \$16.82; James Sullivan, \$15.85; Charles J. Kennedy, \$14.75 per foot.

For the second section of 13-inch brick 2½x3½ feet, the bids were \$17.85, \$17.85, \$25.50.

For the third section of cast-iron pipe of 2½x3½ feet, the bids were \$17.50, \$33, and \$25 per linear foot.

For a 7-foot sewer on Twenty-fourth Street, from York to Huntingdon, the bids were \$19.74, \$20, \$21, \$21.85, \$20.99, and \$23.70 per linear foot.

Bids were also received for a large number of branch sewers, small in length, the principal one being a 3x2 sewer on Brighthelm Street 2,175 feet long, the bidders being John McParland, \$3.90; Dietz & Murray, \$4.43; H. C. Eyre, \$4.73; David McMahon, \$4.80, and J. B. Foster, \$2.63 per linear foot.

The only bidder for grading on Fifth and Armstrong Streets was John B. Foster at twenty-two cents per cubic yard.

BOSTON.—Proposals for furnishing paving blocks were opened July 1 as follows: S. & R. J. Lombard, \$42 per 1,000 for the first 50,000, \$44 for the second 50,000, \$44.50 for 100,000; Rockport Granite Company bid \$53.50 for small and \$66.80 for large blocks; Pigeon Hill Granite Company bid \$58 for small and \$70 for large blocks; Cape Ann Granite Company bid \$46.44 for small and \$68.95 for large blocks; McDonnell & Sons bid \$43 for small blocks. No award was made.

NEW HAVEN, CONN.—Contracts on building the Almshouse were awarded July 7 by the Board of Selectmen as follows: Mason's contract, George M. Grant, \$105,540. The joiner-work, Larkins & Langley, \$57,144. Painters' work, E. R. Jeffcott, \$24,200. Plumbers' work, D. S. Kelly, \$5,600.

Steam-heating, New Haven Steam-Heating Company, \$14,980. All are new Haven parties.

MANISTEE, MICH.—The following bids for constructing brick sewers were received by Walter S. Denning, City Clerk, June 30:

Davies Bros., East Saginaw, Mich., \$32,998, complete; \$15,498 for two ends.

Frank P. Drew, Milwaukee, Wis., \$27,890, complete; \$11,720 for two ends.

Thomas Byrne, Chicago, Ill., \$28,913, complete; \$11,682 for two ends.

CINCINNATI, O.—Bids for paving Eastern Avenue with granite were opened June 29 by the Board of Public Affairs, as follows:

Materials.	Quantities.	Folz, Ashman & Co.	Thomas M. Steele.	F. Kirchner & Co.	M. J. Dady.
Curbs—	1500 lineal feet...	75	50	70	65
Grading—	4500 cubic yards...	30	30	30	30
Granite—	38,133 square yards...	30	30	30	30
Rolling—	9,500 square yards...	20	20	20	20
Gravel—	38,133 cubic yards...	20	20	20	20
Brick Masonry—	850 cubic yards...	40	40	40	40
Drain Pipe 24-inch—	400 lineal feet...	10	10	10	10
Drain Pipe 18-inch—	700 lineal feet...	10	10	10	10
Drain Pipe 12-inch—	300 lineal feet...	10	10	10	10
Drain Pipe 8-inch—	300 lineal feet...	10	10	10	10
One-third on 12-inch—	8 pieces...	10	10	10	10
One-third on 12-inch—	8 pieces...	10	10	10	10
One-third on 6-inch—	100 pieces...	10	10	10	10

Ashman & Co. filed New Hampshire granite; Steele filed Richmond granite; Kirchner & Co. filed Marlboro granite; Dady filed Richmond granite.

The bids were referred to the Engineer for computation and report.

GOVERNMENT WORK.

CHARLESTON, W. VA.—The following bids for iron work for lock gates and trestles for head bay of Lock No. 2, Great Kanawha River Improvement, were received at the U. S. Engineer Office and opened by Colonel William P. Craighead, July 1:

Builders' Iron Foundry, Providence, R. I., 43,000 pounds of wrought iron, 6½c. per pound; 22,500 pounds of cast iron, 6.5c. per pound; 2,200 pounds of steel, 15.5c. per pound; total, \$4,443.

Ainsler, Cochran & Co., Louisville, Ky., 6.5c., 5c., 2c.; total, \$4,184.

Queen City Bridge and Steam Forging Company, Cincinnati, O., 7.2c., 5.2c., 16c.; total, \$5,618.

SYNOPSIS of bids for columns, beams, girders, etc., for first, second and third floors of Court House, etc., at Rochester, N. Y., opened July 5 by the Supervising Architect of the Treasury Department: Phoenix Iron Co., Trenton, N. J., \$14,875; Dearborne Foundry Co., \$14,400; Thomas Marshall Foundry and Construction Co., \$14,947.81; J. B. & J. M. Cornell, New York City, \$14,712; Post & McCord, \$16,570.

SYNOPSIS of bids for approaches to the Post Office, etc., Quincy, Ill., opened by the Supervising Architect, of the Treasury Department, July 5: Larkworth & Menke, \$5,797.75.

SYNOPSIS of bids for dredging in the Virginia Channel of the Potomac River at Washington, D. C., opened June 30 by Colonel Peter C. Hains, U. S. Engineers: Morris & Co. Dredge Co., N. Y., 19c. per cubic yard; Ross & Sanford, Jersey City, 19c.; John H. McNee, Washington, D. C., 15c.

BROOKLYN.—Simpson & Co., of New York City, have received the contract for building the timber dry-dock at the Navy Yard.

ABSTRACT of bids for iron beacon for Milwaukee (North Point) Light Stat on Wisconsin, opened June 30 by Major S. M. Mansfield, U. S. Engineers: Russel Wheel and Foundry Co., Detroit, Mich., \$6,832; John Cooper, Mt. Vernon, O., \$9,865; West Point Foundry Association, Cold Spring, N. Y., \$7,800; J. G. Wagner, Milwaukee, Wis., \$14,800.

WASHINGTON, D. C.—Proposals for ten sets of steel forgings for 6-inch B. L. rifle guns were opened by the Secretary of the Navy July 6. But one bid was received, from the Midvale Steel Company, of Philadelphia, as follows:

For furnishing gun forgings, rough bored and turned, oil-treated and annealed.

Tubes and jackets for 6-inch B. L. R., 31.830 gross tons, \$885 per ton; total, \$28,169.55.

Hoops for 6-inch B. L. R., 26.480 gross tons, \$885 per ton; total, \$23,434.80.

Trunnion-bands for 6-inch B. L. R., 2.680 gross tons, \$1,344; total, \$3,601.92.

Plugs and mushrooms for 6-inch B. L. R., 1.040 gross tons, \$800 per ton; total, \$832.

Hoops for 10-inch B. L. R., 3.191 gross tons, \$1,232 per ton; total, \$3,931.

Grand total, \$59,969.58.

When the rough-boring and turning is done by the Department, 31.830 gross tons, \$716.80 per ton; total, \$22,815.74.

Hoops for 6-inch B. L. R., 26.480 gross tons, \$885 per ton; total, \$23,434.80.

Trunnion-bands for 6-inch B. L. R. (rough boring and turning to be done by the Department), 2.680 gross tons, \$885 per ton; total, \$2,371.80.

Plugs and mushrooms for 6-inch B. L. R., 1.040 gross tons, \$800 per ton; total, \$832.

Hoops for 10-inch B. L. R., 3.191 gross tons, \$1,232 per ton; total, \$3,931.31. Grand total, \$53,385.65.

This second bid is made with the understanding that if the rough-boring and turning of the tubes, jackets, and trunnion-bands are done by the Department, the Department will agree to rough-machine and de-

liver to the Midvale Steel Company on board cars Washington, D. C., each piece within twenty-one days after receipt of same in the rough, and all time in excess of twenty-one days on each piece required by the Department to make said delivery shall be allowed to the Midvale Steel Company in the contract-time of delivery of the set of which said piece forms a part.

PROPOSALS.

(Continued on page 148.)

COURT-HOUSE and office building at Lisbon, Dak. Until July 15. Address M. L. Engle, County Commissioner.

STEAM-HEATING of Ramsey County Court House, Minn. Until August 1. E. P. Bassford, 28 Gillilan Block, St. Paul, Architect. Address M. F. Kain, County Auditor, St. Paul, Minn.

SEWERS.—Proposals will be received until July 26 in the City Hall, Mankato, Minn., for the construction of the Front Street sewer and connections and appurtenances therefor. The work will comprise approximately as follows: 540 lineal feet 36x54 brick sewer, 4,100 lineal feet of pipe sewer from 9 to 18 inches in diameter, 18 manholes, 7 catch-basins, 4,000 lineal feet of house connections. William Davis, City Recorder.

IRON superstructure of bridge, also masonry, on Schier's Road, Symmes Township, O. Until July 30. Address Commissioners of Hamilton County, at the Auditor's Office in Cincinnati.

ERECTING Normal School at Moorehead, Minn. Until August 1. J. W. Stevens, St. Paul, architect. Address D. L. Kiehle, State Normal Board, St. Paul.

BOILERS.—Proposals will be received at the Toledo, O., Asylum for the Insane, until July 19, for the erection of a bath house; also for furnishing and putting in place two boilers. All to be in accordance with plans and specifications prepared by F. O. Fallis & Co., architects, and on file at the Toledo Asylum. Address the Trustees of the Toledo, O., Asylum for the Insane.

Building Intelligence.

We solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

ABBREVIATIONS.—b s, brown stone; br, brick; br st, brick store; h s dwell, brown-stone dwelling; apart house, apartment-house; ten, tenement; r, each s, owner; a, architect; b, builder; fr, frame.

AMONG THE ARCHITECTS.

We report the following from offices of New York architects:

Messrs. Cleverdon & Putzel have finished plans for a six-story brick storage warehouse to be erected at the corner of Chambers and William Streets, at a cost of \$40,000.

Herter Bros., architects, are making plans for nine flats, with stores, to be erected on One Hundred and Forty-fifth Street, between Eighth and Undercliff Avenues, for Mr. Francis J. Schnugg; cost, \$140,000.

Toledo, O.—Architect F. Charles Merry has made plans for a brick, stone, and terra cotta residence to be erected here for Noah H. Swaney at a cost of \$20,000.

Montreal, Can.—Architect Augustus Hatfield has made plans for a seven-story brick and stone fire-proof addition to the Richelieu Hotel. I. B. Durandier is the proprietor; cost, \$250,000.

NEW YORK CITY.

Bank st, s e cor West st, 5-story and cellar br factory cost, abt \$50,000; o, Enoch Morgan's Sons; a, John B. Snook & Sons; b not selected.

8-10 Birmingham st, 2 6-story br tailoring establishments; cost each, \$12,000; o, Lewis Krulwich; a, A. Munch.

109 Madison st, br flat and store; cost, \$19,000; o, Thos M Hugh; a, Alex J Finkle.

N w cor 10th av and 98th st, br flat and store; cost, \$20,000; o, Wm H Neebuh; a, F. T. Camp.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 7. } PUBLISHED EVERY SATURDAY.

NEW YORK, JULY 16, 1887.

LONDON, JULY 30, 1887.

SINGLE COPIES, TEN CENTS. }
Subscription, \$4.00 per year in advance, post paid. } IN AMERICA
SINGLE COPIES, SIXPENCE. }
Subscription, 30s. per annum in advance, post paid. } IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 94 FLEET ST., LONDON.

TERMS, 30s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 20, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new address should be given.

THE AQUEDUCT BONDS OF THE CITY OF NEWARK.

A WARM controversy has arisen in Newark respecting the question of an overissue of bonds. The amount in debate is \$40,000, and from a careful reading of the statements made it does not seem that there is any evidence or intention of fraud. It is a question of the legality of the issue, this amount having been used as collateral, afterward marked canceled, and then four years afterward an equal amount regularly issued to complete the full amount of \$100,000 which had been authorized fifteen years before.

We mention the matter for the purpose of calling attention to the notoriously careless way in which such business is often transacted. It is to the interest of all that municipal business should be transacted in strict accordance with law, and with a careful observance of every safeguard indicated by experience.

Such bonds are sought for as investments of the funds of minors and others who can ill afford to suffer a loss; and anything which tends to lessen the confidence of the public in this class of securities is a general loss to the community.

STREET-LIGHTING IN LONDON.

THE last annual report of Mr. W. Hayward, Engineer to the Commissioners of Sewers of London, contains some facts of interest regarding the lighting of that city. The lighting hours of the public lamps are 4,300, and the thirty-six meters attached to lamps in various parts of the city show that the full contract quantity has been supplied. The price paid for gas is 2s. 6d. (60 cents) per 1,000 feet. Small lights, consuming five cubic feet per hour, cost \$17.36 for square lanterns, and \$18.39 for circular ones, which item includes lighting and repairing. Lights consuming ten feet per hour cost \$30.37 and \$31.40 each, according as the lantern is square or circular.

Mr. Hayward thinks that the Electric-Lighting Act of 1882 "has all but killed commercial enterprise on a large scale in electric-lighting." He says:

"During the year no part of the public ways nor any of the city bridges were lighted by electricity. The Edison and Swan United Electric-Light Company removed their wires and fittings from the Holborn Viaduct subways, and the lighting of private premises on the viaduct was discontinued in June. The proposal for lighting a large area of the city, made by the Brush Company, was under consideration, and a report upon it obtained from Mr. W. H. Preece, F. R. S., but up to the present time nothing definite has been settled."

THE NEW ORLEANS DRAINAGE CANALS.

THE importance of cleansing the drainage canals of New Orleans has again engaged the attention of the Auxiliary Sanitary Association of that city. Theoretically, these canals are to be kept flushed out by the contractors who operate the old-fashioned water-wheels which are relied on to secure a current in them. Practically, these ditches are receptacles for all sorts of rubbish, and through many of them water could hardly pass until they were cleared.

The president of the association, Mr. Fenner, has always been strongly in favor of the systematic and regular flushing of these canals and

opposed to attempts at improving drainage by raising of banquettes. It would seem, however, that any change in the present system of drainage must be an improvement.

HOSPITALS FOR CONTAGIOUS DISEASES.

WE have several times had occasion to call attention to the importance of providing special hospitals for the treatment of those forms of contagious disease in which isolation and disinfection are of special importance. The Municipal Council of Paris has been leisurely investigating this subject for the last three years through a committee, in behalf of which Dr. Chantemps has recently presented a report which is of interest in this connection.

It is certainly time that Paris should take some steps to diminish the proportion of contagious disease which seems of late years to have been increasing within her boundaries. The only special accommodation for such diseases which she now has consists of two barracks for small-pox, one connected with the hospital St. Antoine, and containing seventy-two beds, the other at the Hospital St. Louis containing sixty-four beds.

Nor can the methods actually in use in Paris for dealing with contagious disease be considered as at all satisfactory.

Theoretically, there is a very good set of rules and regulations for such cases, but practically they are not carried out. For example, the total amount expended during 1885 for the disinfection of infected localities was \$163. Disinfectants are stored at the police stations and in the municipal laboratory, but they are not used.

Dr. Chantemps proposes that two special small-pox hospitals shall be constructed, one for the northern and the other for the southern portions of the city, the two to contain 300 beds. It is also advised that two special wards for diphtheria cases be arranged in the two chief hospitals for children, at which also separate pavilions for scarlet fever and measles should be provided. Two stations for ambulances to convey contagious cases to hospital are to be provided, each to have six separate compartments, in each of which two ambulances are to be kept. The vehicles in each division are used for cases of one disease only, the diseases thus provided for being, small-pox, measles, scarlet fever, diphtheria, whooping-cough, and miscellaneous skin affections. There are also to be provided two disinfecting stations, with the usual apparatus for the use of superheated steam, etc. It will be seen that what is recommended is really needed for such a city as Paris, but it is doubtful whether anything will really be done until the stimulus of an epidemic compels attention to the matter.

While most of our large cities are better provided with means for circumscribing and destroying infection than Paris is, and make more use of them, it is, nevertheless, true that the majority of our cities of from ten to forty or fifty thousand inhabitants have no sufficient hospital accommodation, means of transportation, or disinfecting apparatus for dealing with contagious disease, and that until they are provided with these the efforts of health officials to control the spread of such disease must be of comparatively little use.

OUR BRITISH CORRESPONDENCE.

An Iron-Consuming Worm—Knighthood for Mr. Henry Doulton—New Coupling-Rod for Railway Wagons—Accepting a Pupil without Premium from the City and Guilds of London Institute—Lifting a Sunken Ship.

LONDON, June 29, 1887.

ACCORDING to the *Ironmonger*, there is a microbe which has been discovered in Germany, the existence of which is, if report be correct, a terror to engineers. The paper in question, however, doubts the existence of the pest. It is stated that owing to the corrosion of a rail, it was taken up and broken, and found to be hollowed out by a little gray worm of about two centimetres in length. This worm, to which was given the name "railoverous," is stated to carry on its head two small glands filled with a corrosive secretion, which is ejected every ten minutes into the iron, thus rendering it soft and spongy, in which state it is eaten by the intruder. The official report goes on to say that the worm had devoured 36 kilogrammes of rail in a fortnight. A worm, 2 centimetres in length and

Institute of Technical Education, on the recommendation of Professors Ayrton and Thompson. Mr. John Rance, Jr., is the first to receive the appointment.

An iron ship of some 1,293 tons, with a cargo of wheat of about 1,400 tons, which sank in February last in the Mersey directly over the new Mersey railway tunnel, and directly in the way of navigation, has just been lifted. The Mersey Dock Board does not show up well in the matter. They proposed to move the vessel by dynamite, but it was feared that if the explosive was used it would destroy the tunnel. Being apparently incapable of lifting the vessel, they advertised for tenders to raise it, and accepted that of a London syndicate composed of Messrs. Fletcher, Son & Fearnall, ship-builders and engineers; Bullivant & Co., wire-rope makers, and J. & G. Rennie. The tender for lifting and carrying the ship into shallow water was £15,000 (\$72,000), and the time given for the work was three months. It was actually carried out in five weeks. Four hulks, with an average lifting power of 500 tons each, were provided. Messrs. Bullivant supplied special wire ropes of 9 inches and 7 inches circumference.

surface at low water, the first lift was made and the wreck towed into shallow water, where the final lift was made. It is a matter of surprise that the Mersey Dock Board have not provision of pontoons and general plant and gear to effect such operations in such a highway as theirs, but they are, to all intents and purposes, incapacitated when such an accident as the present occurs. SAFETY-VALVE

OUR SPECIAL ILLUSTRATION.

Y. M. C. A. BUILDING AND TURNER BUILDING, NEWBURGH, N. Y.

OUR special illustration shows the Young Men's Christian Association Building (McKim, Mead & White, New York, architects) and the Turner Building (Messrs. Babb, Cook & Willard, of New York, architects) at Newburgh, N. Y. The larger building is that of the Association.

described to be about the size of a prong of a silver fork in circumference, which will consume something like 75 pounds of iron in a fortnight, would probably be one of the wonders of the world.

Amongst the list of Jubilee honors, I see there is a knighthood for Mr. Henry Doulton, the chief of the well-known firm of Henry Doulton & Co., Lambeth.

The question of couplings for railway wagons, and the consequent danger to human life under the old system, has long been a matter of discussion. A practical test, with the object of showing the working powers of a new coupling-rod, has just taken place on the Cheshire Railway at Walton. In the guards' test, twenty wagons were coupled and uncoupled with the rod in 1 minute and 37 seconds. By the shunters, the same work took 1 minute and 31 seconds. Against this, the old style of coupling and uncoupling by hand, to carry out which four picked men were appointed, took 2 minutes and 20 seconds.

The Anglo-American Brush Electric Light Corporation has adopted a far-sighted policy in arranging to accept one pupil without premium from the City and Guilds of London

The 9-inch rope was constructed of 5 strands, each strand of 37 steel wires, the metal having a tensile strength of about 100 tons to the square inch, and a total breaking-strain of about 250 tons. Three double 7-inch strops and three of the 9-inch ropes were placed under the vessel, and attached to other ropes, thus forming slings, which were passed over the hulks and attached thereto by special clamps. These hulks had been strengthened by internal timbering, etc., to provide against nips. On the 14th inst., when the deck of the derelict was nine feet below the

The exterior is of local stone and frame and the inside finishings are of hard wood. R. H. Robertson of New York, is the architect.

THE accompanying illustration of floor plan of McCormick Theological Seminary, Chicago, A. Page Brown, of New York, architect, was inadvertently left out of our last week's issue.

YOUNG MEN'S CHRISTIAN ASSOCIATION AND TURNER BUILDING, NEWBURG, N. Y.

McKIM, MEAD & WHITE—BABB, COOK & WILLARD, ARCHITECTS.

BATH-HOUSE OF THE HOSPITAL ST. ANTOINE, PARIS.*

THE hospital of St. Antoine, Paris, has accommodation, including the additions in progress or projected, for about eight hundred and seventy-five patients. The new bath-house, illustrated by the drawings reproduced herewith, was erected to meet the demand occasioned by the additions to the hospital. The baths are open for two sets of patrons—those who come from outside the hospital, and those who are regular patients, the afternoon being reserved entirely for the latter. The entrance for external patients is from the Rue de Citeaux at *d*, directly into the large waiting-room, which is provided with separate benches for men and women. The walls of this room are sheathed with pine about four feet high. Beyond the waiting-room is an open court surrounded on three sides by a covered passage, from which on either side open the large bathing-rooms for men and for women. These rooms are divided into sections enclosing the set tubs, by light sheathed partitions about six feet high, solid down to the floor, but closed only across the front by a curtain. Patients

are not allowed to touch either the wastes or supplies to the tubs, the attendants managing both. Two bath-rooms for the employees are at the extremity of each of the bathing-rooms. Opposite are two water-closets. All of these are separated from the bathing-room by a masonry wall.

The fourth side of the open court is occupied by rooms in connection with special baths, sitz-baths, showers, sulphur-baths, vapor-baths etc. In the axis of the building at *e*, opening from an interior avenue of the hospital grounds, is the entrance for regular patients. On the right are the robing and reposing rooms for the special baths. On the left are the linen-closets and the sulphur-bath and its robing-room. The robing-rooms are divided in sections by low sheathed partitions of same description as those in the bathing-rooms. At the extreme left is the boiler-room, with engine-room adjoining.

The cost of the entire bath-house was as follows:

Excavation and masonry	\$60,63
Carpenter-work	18 478
Roofing	5,068
Plumbing and general fixtures	19,654
Gas	608
Painting	1,696
Paving	674
Total	\$106,808

* Condensed from *Le Genie Civil*.

There are fifty-two bath-tubs for the use of the patients, besides the special baths and the baths for the employees. The architect was Mr. A. Grandjacquet.

Gas and Electricity.

THE Bethlehem, Pa., Gas Company has reduced the price of gas, after July 1, ult., to \$2 per 1,000 feet, with a discount for prompt payment. The former price was \$2.50.

PERSONAL.

MR. GEORGE E. EVANS, who was City Engineer of Lowell, Mass., for about fifteen years, has accepted a position at Helena, Mont., in connection with the building of the water-works there.

NATHAN HILLES, at one time President of the Trustees of the Philadelphia Gas-Works, died in Frankfort, Pa., July 9, aged 72.

MAJOR JOHN S. BILLINGS, Surgeon, U. S. A.; Captain Washington Matthews, and Captain F. C. Ainsworth, Assistant Surgeon, U. S. A., have been appointed a Board of Medical Officers for the purpose of examining a candidate for admission to the medical corps of the army.

CAPTAIN RICHARD L. HOXIE, Corps of Engineers, U. S. A., now at Montgomery, Ala., has been ordered to temporary duty at Pensacola Harbor.

W. B. FULLER has been appointed City Engineer of Duluth, Minn.

JOHN W. MESUREAU, who died at Richmond, Staten Island, July 11, was many years ago a building contractor in New York City. At his death he was a director of the Staten Island Railroad.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

AN adjourned meeting of the Society (adjourned from the business meeting at the Convention) was held at the Society House on Wednesday, July 13, at 20:30 o'clock.

Ballots were canvassed, and the following were announced as elected for members of the Society:

John Ferris Alden, proprietor and engineer Rochester Bridge and Iron Works, Rochester, N. Y.; Frank Milligan Ashmead, resident engineer Allegheny Valley Railroad, Hulton, Pa.; William Henry Breithaupt (elected Junior June 4, 1884), chief assistant engineer on superstructure of Sibley, Fort Madison and other bridges of Chicago, Santa Fe and California Railroad, Kansas City, Mo.; Henry Thompson Douglas, chief engineer Baltimore and Ohio Railroad, Baltimore, Md.; Ulysses Stanislaus Lutz, principal assistant engineer in charge of Location and Construction Bloomsburg and Sullivan Railroad, Bloomsburg, Pa.; James Moore Shanly, resident engineer Massena Springs and Fort Covington Railroad, Montreal, Canada.

RECENT WATER-WORKS CONSTRUCTION.

No. XIII.*

WARE, MASS.

THIS small but enterprising town is located in Hampshire County on the Ware River and a branch of the Boston and Albany Railroad. It lies almost exactly midway between Springfield and Worcester and has about 6,000 inhabitants.

Cotton and woolen mills give employment to more than 2,000 operatives, and the river valley affords some opportunities for farming.

During the season of 1886 the town entered upon the construction of water-works with Frank L. Fuller, C. E., of Boston, as both consulting and constructing engineer.

The work was all under the direction of the three Water Commissioners, Messrs. C. C. Hitchcock, Edgar H. Guild, M. D., and Thomas C. Gleason. Rigid economy was practiced, but not to such an extent as to induce the Commissioners to endeavor to dispense with that important element of sound water-works construction—a distributing reservoir of ample capacity.

The temptation to excessive cheapness was not great in this direction, however, for the valley of the Ware River is enclosed at this point by hills rising 600 or 700 feet, and the reservoir is located on the slope within easy distance of the town, giving a head upon the distribution of from 75 to 225 feet—on Main Street about 192 feet.

In the construction of the reservoir a saving of perhaps \$2,500 was effected by omitting the usual gate-house. The arrangement of screens about the inlet and outlet pipe is clearly shown in the illustration. The reservoir has a capacity at the high-water line of 1,557,600 gallons, and its construction involved:

8,433 cubic yards earth excavation.
881 " " rock excavation.
179 " " clay puddle.
638 " " concrete.
268 " " broken stone.
1,608 square yards stone paving.
355 " " sodding.

This work was done by F. A. Snow, of Providence, R. I., by contract, and cost about \$13,600.

A 12-inch gate in the main, outside the reservoir, permits the isolation of this portion of the system and gives

COLLECTING WELL.

an opportunity for direct pumping, should such an arrangement ever seem desirable.

Eleven test-wells were driven during the first two weeks in May, and the location of the collecting well was fixed upon the east side of Muddy Brook, a tributary of Ware River, at a point 300 feet from the brook and upon the site of an abandoned brickyard. After digging through 10 or 12 feet of clay, a porous gravel was reached, which has yielded, under continuous pumping by a Weber centrifugal pump, during the driest part of the season, from 600,000 to 700,000 gallons in 24 hours, by weir measurement.

The temperature of the water in Muddy Brook, April 19, 1886, was 57° Fah., and that of the water in a spring near the present well was 48°. On January 1, 1887, the brook-water was 34° Fah. and the well-water 49° Fah. It is said that a watering-trough formerly supplied with river-water froze over every winter, but that the same trough since it has been supplied with well-water has remained opened with the thermometer 14° below zero.

F. E. Shaw, of Providence, R. I., built the well in just three months' time. The water is forced by a compound,

*No. XII., the Water-Works of Charlottesville, Va., was published on page 657, issue of April 9.

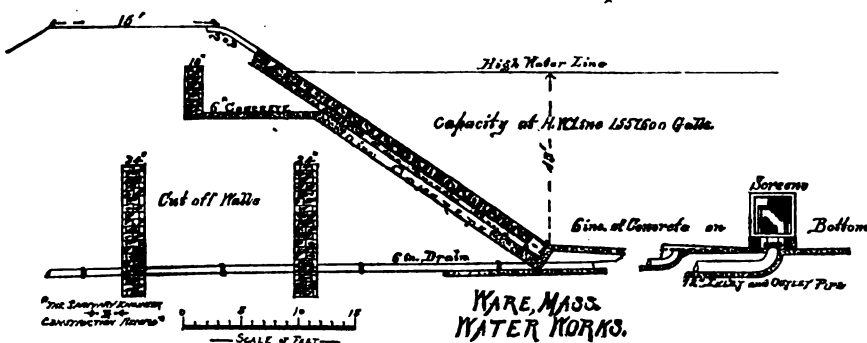

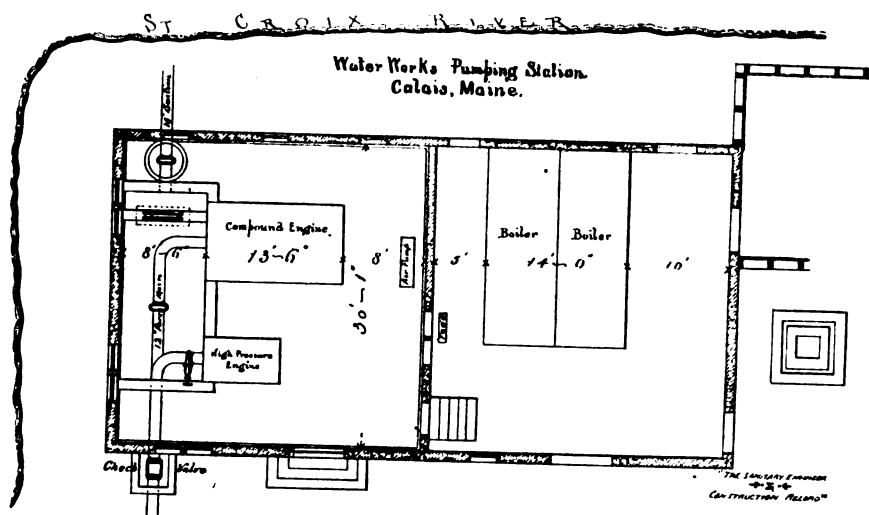

condensing, duplex pump, furnished by the Deane Steam-Pump Company, of Holyoke, Mass., through 7,700 feet of 12 and 10 inch pipe to the reservoir. The pump has a capacity of 1½ million gallons in 24 hours and has given a test duty of over 48 million foot-pounds with 100 pounds of coal.

Water for condensing is taken directly from the brook by a special connection rather than from the well.

December 15 Mr. Langford had laid 5.9 miles of pipe, with the usual gates and connections, at an average cost of about \$5,330 per mile.

The service pipes are of wrought iron lined with cement, having couplings and tees lined with composition.

The tasteful brick pump-house was built from designs of architect Ernest N. Boyden, of Boston. The total cost of the whole plant, not including land damages, may be set

The main distributing system is of cast iron, from the A. H. McNeal and Warren foundries, of sizes from 12 to 4 inches. A portion of the 4-inch pipe has been laid some years and has been used in connection with the pumps of the Otis Company's Mills as a means of fire protection. There are 48 hydrants and 57 gates, all from the Chapman Valve Manufacturing Company, of Indian Orchard, Mass. The pipe-laying was done by contract by John T. Langford, of Boston. Work was begun September 14, and by

down as \$72,500, and the fire district pays the town \$2.500 per annum.

CIVIL ENGINEERS' SOCIETY.

The civil engineers of Helena, Mont., are sending circulars over the Territory looking to the organization of a Territorial Society of Civil Engineers.

THE ANNUAL CONVENTION OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

(Continued from page 157.)

WEDNESDAY, JULY 6.

THE session to-day was opened at half-past 10 A. M.; and as the Chairman, Mr. T. C. Clarke, was absent, Mr. Robert McMath, of St. Louis, was appointed to fill his place.

The first paper was on "Disposal of Sewage in Massachusetts," by Frederic P. Stearns, and read by the author. The writer's treatment of the subject was local in character. He gives the population per square mile in 1880, which is for Rhode Island, 255; Massachusetts, 222; New Jersey, 152; Connecticut, 129; New York, 107; Pennsylvania, 95; Maryland, 95. Massachusetts is now more densely populated than France or Germany, and not far behind Italy, Great Britain, and Ireland.

A Massachusetts Drainage Commission was appointed in 1884 for the purpose of considering and reporting a general system of drainage for the relief of the valleys of the Mystic, Blackburn, and Charles Rivers, and for the protection of the public water-supplies of the cities and towns within the basin of said rivers.

Mr. E. C. Clarke was appointed Chief Engineer, who submitted his report to J. P. Davis and Rudolph Hering, as consulting engineers.

The present engineering staff consists of the writer as Chief Engineer and J. P. Davis as Consulting Engineer.

This State board is given advisory, and not mandatory, powers.

The next paper was a discussion of Mr. Stearns' paper by Charles Allen, and read by the Secretary.

The writer visited Europe in 1883, and examined various methods of sewage disposal in use there, the information so obtained to be used in suits against the city for polluting the Blackstone River, and also for determining the best methods of disposing of the sewage of the city.

The history of sewage in England dates back nearly half a century.

Early in the present century the rivers and streams became polluted in populated districts, and a large amount of capital invested in works for this purpose was nearly all lost. A few examples of early efforts are given:

"At Aldershot and Rugby the sewage was strained through planks perforated with holes three-quarters of an inch in diameter, but purifying effects were slight, for the amount of suspended matter was only reduced from 43.73 grains per gallon to 35.01 at Aldershot, with about the same result at Rugby, while the organic matter was 14.02 grains per gallon before and 8.77 grains per gallon after treatment."

"The more elaborate system of filtration, as practiced at Merthyr-Tydvil, when the sewage passed through a filter of coarse iron slag, about three feet thick, and then through another filter of coarse vegetable charcoal, the suspended matters were reduced from 169.81 grains to 32.31 grains per gallon, but soluble matters were not affected."

"Mr. Strong, of Glasgow, designed an apparatus with a filtering medium of coal ashes. The filtration was upward and solid matter retained in lower part of filter."

"At Birmingham sand filters were used with about the same success, while at Chelmsford and Belston clinkers and ashes were employed."

It was found that if filtering material was fine in texture it soon clogged, and if coarse it failed to remove a large amount of matter carried in suspension.

The result obtained in every instance of mechanical filtration tried was about the same.

"Birmingham originally tried subsiding tanks, which were about 90x50 feet; from thence it flowed over a weir guarded by floating boards into a tank of similar dimensions, and then over a weir into a third tank 30x150 feet, and then into a fourth about three times the capacity of the last, and carried from latter into a channel to the river Rea. A large portion of heavier matter was deposited in the tanks, for it took two hours for the sewage to pass through the series, but still the effluent water was very offensive. The combined system of sedimentation and filtration was scarcely less successful."

"The history of sewage treatment in England is full of failures; while some were nearly self-supporting, none of them paid."

"Their attention was given to irrigation and chemical precipitation which is practiced at the present time, and this system when the climatic conditions are favorable, a good effluent is obtained, but in no case, so far as able to learn, has any profit been made, for the sewage comes night and day, during rainy weather and dry, demanding constant attention. Most of the vegetable growth is very coarse and used principally for feeding cattle. Experience has shown it is necessary to provide one acre of land for each 100 inhabitants, that the land so used shall have a subsoil of gravel or sand, and properly underdrained if required, the drains being not less than five feet below the surface of the ground, and during heavy storms the sewage shall be filtered through beds especially prepared for the purpose or turned direct into streams."

Chemical precipitation was found expensive and failed to produce any profit. The failure to dispose of the sludge by this process was a great drawback to success.

"The best results were obtained by either one of the three following methods: 'The lime process' which is the most extensively used, the 'Coventry process,' and the 'A B C process.' The latter is very expensive and not in general use."

"The disposal of the sludge in some cases is a great drawback to the latter method. Still there is sufficient merit in the system to induce about fifty cities and towns in England to adopt it."

The sludge in all cases contains about ninety per cent. of water, and when spread upon land to dry sufficiently to handle it, in a short time becomes more or less offensive. But when a large percentage of the moisture is extracted by the sludge process, leaving the compressed cake in a condition to handle, the odor is removed.

"Dr. Frankland in 1870 suggested downward intermittent filtration as a means of purifying sewage, which was adopted by Mr. Bailey Denton in his practice."

It differs from broad irrigation in that instead of spreading sewage over a large surface of ground, having in view the raising of crops, a small area of porous land is selected and thoroughly underdrained, the tract being divided so that while the sewage is applied to one section, the other has a chance to rest and ground is thoroughly aerated.

Irrigation and chemical precipitation are the most extensively employed, downward intermittent filtration being principally used as an auxiliary to one of the methods.

The climatic conditions in Massachusetts are not as favorable to the proper treatment of sewage by irrigation or by filtration as in England and France, or even Germany.

"The Commission appointed by the State Board of Health in 1881, consisting of Charles F. Folsom, M. D., Joseph P. Davis, C. E., and Henry P. Walcott, M. D., reported as follows: Considering the extreme heat and cold of the climate, the heavy rainfall, and the dilution of the sewage, the difficulties in the way of a satisfactory disposal of the sewage of Worcester are far beyond those of any other town where the question has been met. So that any scheme that may be proposed may be said to be experimental to a certain extent."

The sewage farm at Pullman, Ill., was visited in January.

"This farm has an area of about 140 acres, nearly all of which is devoted to irrigation; there are ten acres, however, set apart for a filtration area, this being thoroughly underdrained, the drains being about twelve feet apart. On the day of our visit the thermometer was 40° Fah. The sewage was all being discharged upon the filtration area, the first section of which was covered with sludge to a depth of about one foot. The sewage running over this to the second section which was partially covered with ice, and then over the remaining area which was entirely covered with ice, and was finally discharged into the effluent trench without having been filtered in the least. I was told that not a particle of sewage has been applied to the farm proper during the winter, it all having been passed over the area already described.

"It takes careful management to prevent a sewage-farm from becoming offensive. The advantage to intermittent filtration over broad irrigation is that a much smaller area of land would be required, and the raising of crops would have to be made of secondary importance.

"To obtain good effluent, especially when the area of land is limited, some means of separating the sludge from the sewage is almost absolutely necessary, to prevent the ground from clogging. For the city of Worcester I have recommended chemical precipitation, with the possible addition of a filtration area, to be used in connection with the precipitation works during the summer months."

Oral discussion followed, Mr. E. C. Clarke, of Boston, being the first speaker, who gave a detailed account of the treatment of land with sewage at Medfield; one square acre of land having been devoted to this purpose. The surface was graded with highest point in centre of plot, having a slope from it in every direction of six inches per 100 feet. There were four equal divisions in the plot, and all sewage discharged at the centre; the flow continuing for two consecutive days only on a division, when it was turned on another; the discharge being at the centre, it could, therefore, be easily diverted. The interval between the intermittent flow would then be about one week.

The water-bearing soil extended to a depth of eight feet, which was gravelly in character, and surrounded by soil of a similar nature. The amount of sewage discharged was supposed to be about 36,000 gallons per day. Some trouble was experienced from the refuse of the dye-works, which was partially removed by placing slats on the outflow tank. This ground had never been underdrained. No trouble has ever been experienced in winter when the ground was frozen, even in the coldest weather. There was no odor to the soil treated.

At Pullman, near Chicago, where 140 acres are treated with sewage, there was perceptible odor; the sewage there being allowed to flow in one place for two months, and appeared to receive little attention. He did not think 100,000 gallons per acre per day too much for gravelly land. On clay-land and loam the purification is better than on light soils, but would require ten times the area of land to dispose of the same amount of sewage.

The fluid portion of sewage has been utilized for vegetation at Pullman, and found to greatly increase the crop. He thought that the temperature of the water-supply should be considered. If supply had always a very low temperature it would affect the success of the discharge of sewage.

Mr. Emil Kuichling, of Rochester, thought that sewage filtered through gravel was simply a mechanical operation. He stated that Professor Alexander Miller, of Berlin, who had charge of an experimental farm which is operated for profit, made a report to the Agricultural Society in 1885, in which he stated that the tendency was to reduce the quantity of sewage per acre per day, which in

Europe was from 30 to 50 gallons per head per day, and in the United States 50 to 160 gallons.

In England the amount of sewage was 1,100 gallons per acre per day. Sanitarians have demanded a reduction in the quantity to not more than 220 gallons, and in 1884 to 100 gallons, with a tendency to reduce it to 50 gallons if possible. He visited 30 or 40 sewage-farms in Europe, and on all the odor was a marked nuisance. Mr. Stearns stated that he had examined a similar number there and failed to discover any odor.

The odors in this case appear to be a changeable quantity. Mr. Kuichling referred to a report made by Dr. Tidy before the Society of Arts, England, giving rate of flow of sewage through settling tanks which are built in a series, about 6'x6', with sloping sides, and six feet deep. Time for first tank, two hours; second and third, four hours each; then discharged over a small weir; thence over a series of cascades, thickness of flow for latter being one-half inch.

Mr. Seth Green, of the New York State Fish Commission, stated to the speaker that a prevailing impression that trout would only live in pure water was erroneous. It was a question of temperature with them and not quality. They will live in water fit only for pigs to wallow in if cold enough. The surface of land irrigated with sewage has often been known to become clogged by a species of fungus, generally white in color, but sometimes red or orange. An engineer when making plans for sewage disposal by precipitation and irrigation should carefully consider what the sanitary effect would be in the future.

Mr. Robert McMath, of St. Louis, stated that the question to be decided at Chicago was how much more sewage can be carried off in the Illinois River without becoming a nuisance.

Mr. B. S. Church suggested that sewage be aerated by forcing compressed air through it, thereby removing the offensive odors. Data was now being collected in the Croton Valley for the purpose of deciding what disposal should be made of the sewage, but not far enough advanced to permit him to give any information.

Mr. E. Kuichling replied that an English chemist had made some experiments with aeration with unfavorable results, but were not carried to the extent proposed by Mr. Church. Chemical precipitation, which precedes irrigation, had met with much success in England.

A large portion of the details given in this oral discussion were brought out by questions from other members.

Mr. William H. Wiley extended an invitation to the members to visit the sewage-works now in process of construction at Orange, on Saturday afternoon, which was accepted. The discussion of sewage then closed.

Professor R. H. Thurston, of Cornell University, presented a statement of the land grants made by the Government for promoting technical education. He feared that some of the colleges and schools had lost sight of the object of this grant, and were devoting too large a portion to general education, which was not intended when the law was passed. He proposed that a committee be appointed to collect information by correspondence in the United States, and also in foreign countries, of the use similar funds were devoted, and act as an advisory committee only; to aid in creating a sentiment with those who may have charge of similar funds in this country favorable to the use these funds, acquired from the sale of public lands were intended to be applied. He feared that the main object of this fund had been lost sight of in many cases, through want of correct information on the subject, and thought that such a committee appointed by this society could do much to correct any irregularity in the use of these funds.

Mr. E. P. North thought that the Spanish language, which prevails in the Central and South American countries, where American engineers can look for employment in the future, should receive equal attention in colleges with French and German.

The morning session was then adjourned, to meet at 15 o'clock, or 3 P. M.

The afternoon session was opened at 15 o'clock, and the first paper presented was on Cable Railway Propulsion, by G. Leverich, of Brooklyn. The paper was mainly a detailed description of the appliances in use on the Brooklyn Bridge, of which an abstract cannot be intelligently presented without the drawings, which according to the regulations of the society cannot be used until after being issued by the society in its Transactions. There were twenty-seven drawings presented with this paper.

In reply to questions from members, he stated that the principal wear of the cable was due to the hard surface of the sheaves at the terminal stations, and that wherever the cable passed over soft material the wear was reduced. A grip having solid metallic jaws had been tried for one day, which caused a greater injury to the cable than months of constant wear of the grip now in general use on the bridge.

Large detailed plans were then exhibited of the mode of disposing of the sewage in Newark, N. J., a full illustrated description of which appeared in THE SANITARY ENGINEER AND CONSTRUCTION RECORD, on page 600, volume 15, May 7, 1887.

Professor Thurston presented a large blue print copied from a drawing by a new mechanical process, which has also been described in THE SANITARY ENGINEER AND CONSTRUCTION RECORD, and can be found on page 46, volume 16, June 11, 1887.

The Convention then adjourned to 20 o'clock, 8 P. M.

A business meeting was held at 20 o'clock, with the President, William E. Worthen, in the chair.

The first business transacted was the appointment of a Nominating Committee of five members not officers of the society. This committee will present to the Board of Direction, on or before the first day of November, the names of the persons selected by them as candidates for officers.

A distribution of members into districts collected from the society's list of membership, by Mr. J. P. Davis, was then presented by him.

Taking the resident members, there are 275; the rest of New York State, New England, and Canada, 207; New Jersey, Pennsylvania, Delaware, Ohio, Indiana, and Michigan, 156; Illinois, Missouri, Wisconsin, Minnesota, Dakota, Nebraska, Washington Territory, and Oregon, 150; all the rest of the States and Mexico, 144, which is about as well as the lines can be drawn.

Mr. Whittemore moved that the distribution of districts be adopted, which was carried. The districts will then be as follows:

No. 1.—Resident members, New York City, and fifty miles around it.

No. 2.—Rest of New York State, New England, and Canada.

No. 3.—Rest of New Jersey, Pennsylvania, Delaware, Ohio, Indiana, and Michigan.

No. 4.—Illinois, Missouri, Wisconsin, Minnesota, Dakota, Nebraska, Washington Territory, Oregon.

No. 5.—All the rest of the States and Mexico.

The following names were then presented as candidates by members from each district, and elected by vote of all members present at the meeting:

No. 1.—Colonel William H. Paine.

No. 2.—Clemens Hershall.

No. 3.—Frederick Graff.

No. 4.—R. E. McMath.

No. 5.—C. H. Latrobe.

A resolution was then presented by R. E. McMath for the purpose of taking the sense of the meeting:

"Resolved, That it is the sense of this meeting that it is expedient to create a grade of *students of the society*, said grade to consist of young men over eighteen and under twenty-five years of age, who are engaged in the study or practice of engineering. Connection with the society to cease as each individual student reaches the age of twenty-five, unless he shall be previously elected to a higher grade."

The privileges proposed to be granted by this grade are, attendance at meetings, and to receive the transactions of the society by the payment of a small fee.

After a long discussion the resolution was referred to a special committee, to be appointed by the President, which is all that could be done at this convention. To make any change in the constitution it will be necessary to submit a resolution at the annual meeting in January, and then, if passed, this resolution will be sent out for ballot to all the members of the society.

The President appointed on the Special Committee: Mr. Robert E. McMath, Colonel W. H. Paine, Professor R. H. Thurston, Mr. Robert Moore, Mr. Frederick Brooks.

Mr. E. P. North introduced the following resolution for the purpose of bringing the subject before the society, which was introduced by Professor Thurston at a previous meeting:

"Resolved, That the Board of Direction of the Society be requested to consider the advisability of appointing a committee on Technical Education and Professional Training, which shall annually report to the society the state and progress of such instruction in the United States and Europe as well, together with such data, statistics and suggestions relative to the subject as may seem to them proper. Said committee to co-operate with similar committees of other engineering societies, should such be advisable."

"Resolved, That such committees give especial attention to the matter of the formation and administration of those institutions known as the 'Land Grant Colleges,' established by the several States under the Morrill Bill of 1862, and report to what extent said colleges are carrying out the original leading objects prescribed by the funds donated under that law have been applied to such leading objects, and to what extent, if at all, diverted from their original purpose; and, further, to report what manner said funds may be in the future, in the opinion of the committee, rendered most useful in the promotion of the industrial arts and the education of the industrial classes."

Referred to the Board of Direction.

The business meeting then adjourned to Wednesday evening, July 13.

THURSDAY, JULY 7.

The convention was opened for discussion of papers about 10 A. M.

The Secretary read a letter from an officer of the Panama Canal Company, now in New York City, which traverses many of the statements made before the society recently by Mr. Bowlange, an engineer for several years in the employ of the company. The subject was discussed by Messrs. McAlpine, McMath, Cooper, Moore, and Bogart, from which the following information is given: The tide on the Atlantic side is about three feet, and six feet between maximum and minimum tide. On the Pacific side it is 24 feet, which will make tidal-locks necessary

at the entrance of the canal. The tidal flow in the canal would be from eight to ten miles per hour, but the tides are not simultaneous as to time of flow. The bed of the Chagres River is 45 feet above the bed of the canal, and surface flow of the river 45 feet higher at flood. The proposed dam is three-fourths of a mile in length at bottom and one mile long at top, and, as first proposed, 160 feet high. As there is no rock in the vicinity available for building purposes, the intention is to make an earth embankment. The rainfall on the Isthmus is from 194 to 200 inches per annum. To remove the large amount of water collected in the reservoir it is proposed to construct a canal similar in size to the present one, having a fall of from two to three feet per mile.

The next paper read was a discussion of Professor Robinson's paper on "Vibration of Bridges," by Thomas H. Johnson, of the Pittsburgh, Cincinnati, and St. Louis Railroad, Columbus, Ohio. Professor Robinson states clearly and correctly the manner in which trifling and inappreciable vibrations may have their amplitude enlarged to an indefinite extent by cumulative effects of continued repetition of the primary impulse at intervals "synchronous" with the time of vibration, and then proceeds to establish formula for determining by analogy from like formula of springs. Mr. Johnson states "that any analogy existing between a pin-connected iron-bridge truss and a tempered homogeneous steel spring lacks demonstration." Mr. Robinson next proceeds to find the conditions favorable to cumulative vibrations, in relations between the distance apart of the tracks under the cars, and the length of the panels in the bridge. But the Professor has previously shown that each bridge has a time of vibration peculiar to itself. This of necessity must remain constant for the bridge, whatever the amplitude of the vibration, or the intensity of the force producing it; just as a given pendulum will beat in equal time, however wide the arc through which it swings. The effect is, however, that the tracks under a freight train are very far from being uniformly spaced. They vary not only on any given road, but a still greater diversity would be found by comparison with cars used on other roads. The writer suggests that a possible cause might be found in the presence of "flat" wheels in the train—that is, wheels in which some part of the circumference has been worn flat by sliding on the rails.

A paper on "Stress of Bridges," by W. H. Booth, of Manchester, England, was next read. He states that the tendencies of the modern American and best English practice is towards a reduction in the amount of the factors of safety, but should be called the factors of uncertainty. It is clear that should a final determination of the full effect of any and every load upon a structure be accurately made, the factor of uncertainty would be at once replaced by a marginal factor which would serve to determine the true working strength of the structure under known load, and such working load would differ little from a loading that would cause final rupture. The old principle which allowed uniform stress upon every part of a bridge, whether references to its place in the structure have been discarded, the modern methods fully recognize that different details require different working stresses, the parts subject to suddenly applied loads are to be calculated as for static loads of much greater magnitude. The writer thinks that a rational method of procedure, to be followed in determining the total action of moving loads, ought to be expressed as equivalent static load when possible. He then proceeds to demonstrate his theory with formulas which would, to present an intelligent abstract, require more space than can be devoted to this interesting paper at present.

This and the preceding paper was discussed by Theodore Cooper, who stated that the vibration of the camber of a bridge will be less when a train passes over it at high rate of speed than it will when a train passes over it slowly.

The paper on "Compressive Strength of Steel and Iron," by Mr. Charles A. Marshall, had been prepared for presentation to the convention of 1886, but was withdrawn and rewritten for the convention of 1887. The experiments were undertaken to discover the relation which compressive strength of steel bears to tensile strength, and the inquiry was extended to include wrought iron. No attempt was made to test full-sized members of structures, nor any shapes but solid rolled bars as they came from the rolls, but the author believes that they indicate a general law, to which his attention had first been directed by Mr. James E. Howard, engineer of the testing-machine at the Watertown Arsenal—viz.: "That the elastic limit of the material is the chief factor in determining the ultimate resistance of struts of ordinary length made out of wrought iron or steel, excepting the very hardest kinds; and that the two quantities, elastic limit in compression and ultimate compressive strength, are identical within a considerable range of length ratio of columns." With reference to change of length under load, he concludes: "First—When a load equal to the elastic limit of any of these materials is imposed and allowed to remain for some time, it causes permanent change of length, amounting, it is believed, to much more than has been generally understood, and which is apparently a very definite quantity for each case. Second—This change of length having begun under a load equal to elastic limit, will continue under a less load. The plotted tests in tension were all so made as to develop the amount of this stretch; and it is demonstrated in the cases of the 100,000-pound steel, the 67,000-pound steel, and the hard iron made from scrap, that the total is obtained equally as well, though requiring greater length of time, with a load 1,000 or 500 pounds less than primitive elastic limit as with a load equal to that limit." The paper was accompanied by

many tables of compressive and tensile tests on steel bars of various diameters, also tests on wrought-iron bars.

In a paper by Mr. James G. Dagron, some experiments on the strength of Bessemer steel bridge compression members were described, which were made in connection with the construction of the Susquehanna River bridge on the Philadelphia branch of the Baltimore and Ohio Railroad. The steel was the manufacture of the Pittsburgh Bessemer Steel Company; the tests were made at the works of the Keystone Bridge Company, of Pittsburgh, contractors for the superstructure of the bridge. As a result of the tests, Mr. Dagron concludes that they show that "Rankine's formula cannot be used for steel columns in its present form by simply allowing an increase of load of 37½ per cent. for steel over iron compression members. If this formula is to apply, new numerical coefficients will have to be determined by a much greater range of experiments than those covered by the present paper, and it may then be found that in the law governing the flexure of steel columns of a given grade of material, increasing in length, the lateral stiffness of the material may become a factor of increasing importance in determining the stability of the column."

Mr. Mace Moulton, who was for a time in charge of the construction of the railroad bridge over the Ohio River, at Louisville, built by the Kentucky and Indiana Bridge Company, described the construction of this bridge. The original contracts were let in the fall of 1881, Mr. John MacLeod, of Louisville, being chief engineer, and Mr. C. Shaler Smith, of St. Louis, being consulting engineer. Complications arising with certain railroads, the work was for a time suspended and renewed under different contracts. The bridge was completed in the summer of 1885. The bridge is a system of cantilevers over the channel, with a total length between the centres of end piers of 2,453 feet. There is a continuous cantilever-system of 1,843 feet, "the largest yet constructed, so far as known to the writer." The difference between extreme high and extreme low water was 67 feet; and as the Act of Congress providing for the construction of bridges over the Ohio required that the lowest part of any structure spanning the channel of this river should be 40 feet above extreme high water, the bottom chord centre line had to be 107 feet above lowest low water. The specifications required the superstructure to be of oolitic limestone, with courses up to 18 feet above low water; 37 inches in thickness; stretchers not over 8 feet 6 inches long by 3 feet wide; and headers not less than 6 feet long by 3 feet wide. Above this the courses varied, with a minimum thickness of 2 feet 1 inch. The cantilever system was of steel in the trusses and iron in the floor; the remaining spans were entirely of iron. The estimated cost was a little more than \$1,000,000.

A discussion followed on a paper read before the Society by A. M. Wellington, on "American Line from Vera Cruz to the City of Mexico, via Jalapa, by O. L. Nichols, of the Suburban Rapid Transit Railroad, New York."

The writer states that it is not certain that the length of line and sharp curves will more than counterbalance the resistance due to a considerable increase of grade. It is absurd to attempt to lay down definite laws which shall be invariably followed in the location of all lines of railway. Each piece of topography is different from every other and requires special study and special treatment.

The paper under discussion leaves the impression that it was the custom to use continuous uncompensated grades of four (4) per cent. both on the English lines in Mexico and on the Peruvian railways. On two lines of Peruvian railways the minimum gradient is 1.06 per cent., and the maximum 3.94. The railway line in Peru begins at Callao and ascends to an elevation of 15,648 feet at Galena.

The next paper was a discussion of the same subject by A. Bryson, of the firm of Shunk & Bryson, of New York. The writer does not agree with Mr. Wellington, that a "switch-back," for surmounting high altitudes, when constructed as he proposes, that there is no loss of distance or time, but a gain.

Mr. Wellington stated that the "Abt System" is rather costly both for maintenance and renewal, and its range for profitable employment must be limited. The writer thinks that although portions of the system are rather costly, yet, when taken in connection with a certain saving in length of the line to construct, maintain and operate, with the strong probability—almost certainty—of finding easier ground, I think the first cost will be very much reduced, and show the system to be the most economical yet devised for mountain railways, both in first cost and in maintenance and operations.

Mr. W. W. Evans says in his paper on the Abt system (Trans. Am. Soc. C. E., March, 1886): "Any system which admits in expansion of limit of gradients will greatly reduce the cost of construction of new roads, but a system like that of Mr. Abt, which combines at once an extensive range of gradients with perfect safety and economy of operation will prove a perfect boon. All our construction expenses in excavation of earth and rock, in masonry per mile of road, will be similar, and the road itself will be materially shorter, and it will take much less time to build it and have it in operation. So great is the saving from all these sources that even including the extra expense for rock, rail, and engines, the cost per mile of the shorter Abt will never reach the cost per mile of the larger adhesion lines."

The cable system must be built at first for its maximum business, but not until that is reached will its operation become economical.

The switch-backs are limited in possible development, and when worked up to the full capacity of a single track,

with long sidings, present an element of danger. But each of these systems has its uses, and either may be at times advisable.

The meeting then adjourned to 15:30 o'clock.

The closing session of the convention was opened at 15:30 o'clock, and the only subject discussed was the maintenance and inspection of bridges. Mr. Wilson's paper was read at an earlier session, but placed with the last discussion for convenience.

Inspection and maintenance of railroad structures, by James M. Wilson, read by author: He stated that so many changes are being made from time to time, particularly in engines, that if a standard were adopted for the engine loads conforming to or covering a particular series of engines, it would not remain standard very long; it would, therefore, seem best if engines were considered separately to assume a typical engine, designed not only to some existing type, but to anticipate the outcomes of the future. So far as the framing of a law is concerned to govern this subject, railroads might be classified as first, second, and third class. The limit of live load should be made much higher than it generally is, and that recently authorized by the Pennsylvania Railroad met with his approval. Inside guard rails are apt to give trouble when obstructions fall on the track, and as outside guard rails are equally effective he preferred them. A tabulated list of all bridges on a road and complete detailed drawings with strain sheets calculated under certain assumed loads should be prepared. Each division of a railroad should have an assistant engineer competent to make examination of bridges, and under him should be a practical man, a superintendent of bridges, competent to make all needed repairs. They to be held responsible for the care of the bridges within the division. (If further expert examination is needed they ask for it.) Daily, weekly, or monthly examinations should be made, if necessary, which may be supplemented by daily inspection of the road foreman. Special inspection should be made once in two years by an expert. If these examinations are made by competent men, and advice carried out by the railroad company, there is no reason why the traveling public should not be efficiently protected.

Mr. G. H. Pegram states that bridge inspection should be made at long intervals of time by experts, rather than frequently by unskilled men. There seems to be no reason for specifying an engine wheel-base when better results can be obtained in much less time with a uniform load in combination with a single concentrated load. It does not seem expedient to adopt a standard bridge floor, because the proper floor to use will depend upon the construction of other parts of the bridge. Buckle-plates contain elements of danger on account of inaccessibility to inspection. He favors rails running to a point similar to the Latimer device, in addition to a guard-rail notched over the ties and having an angle-iron nosing throughout its length. Legislation on any points covered by the suggestion in the circular would seem inexpedient, because the selection of men with sufficient integrity and free from personal bias and political influence would be almost impossible.

A paper by Mr. J. A. L. Waddell, of Phoenix Company, was read by Robert Moore. The writer favored matured legislation to control bridge inspection that will require detailed plans and strain sheets, to be filed either at Washington or at capitals of States under which company was chartered, that have been made by a bridge expert. To prepare the laws relating to inspection and capacity of railway structure a committee might be appointed thus: The Government to choose a prominent member of the legal profession who has had experience in railroad matters, the President of the American Society of Civil Engineers to appoint two bridge experts, and then the three to choose another prominent member of the legal profession and a railway engineer of long experience. This committee should make a classification of roads according to character of their rolling stock and traffic, then prepare a general specification for bridges, designed so complete as to cover every detail—these specifications to be used for all new bridges, old bridges being allowed a percentage of deviation from these requirements. After the passage of these laws, let the Government give authority to the American Society of Civil Engineers to appoint a board of bridge experts to act as examiners of applicants for the position of "qualified bridge inspectors." No one who is not a full member of the American Society of Civil Engineers to have an examination, but the method of voting upon candidates in the society should be modified if this arrangement is adopted. A candidate should be required to have had ten years' practical experience (if a graduate of a technical school, six years), including three years devoted to bridge work. The committee to have power to annul an inspector's certificate for cause. The details of inspection should be: (1.) Measure systematically the dimensions of the structure and the sections of all the principal members, recording always in a uniform manner. (2.) The size of all parts in the neighborhood of each panel point, and each connection with main members, showing numbers, spacing, and diameter of rivets, including the distance of centre line of each piece from planes of symmetry, dimensions of eye-bar heads, thickness of bearings. (3.) All details of main members between panel points or connections, such as size of lacing-bars, stay-plates, stiffening angles, etc. (4.) Examine for any faults of manufacture or design, such as loose or unequally strained tension of members, bad packing, omission of fillers, bad riveting, twisted or otherwise distorted members, inefficient bracing, etc. Also the effect of wear, such as loose rivets, bent pins, rust, decayed timber, cracked castings and de-

fective masonry. (5.) Efficiency of floor system—viz., the ties, rails and guards, and means of protection from fire and vibrations, etc. (6.) Detailed description of substructure, with its relation to chasms or streams. (7.) Effect of rapidly-passing trains on the bridge. There should be several standards of rolling loads. A standard bridge-floor should be adopted, and would recommend that stringers be placed directly under the rails; that the ties be of 6x8 timber, laid flat and spaced twelve inches between centres, and every sixth or seventh tie to extend over the whole clear width of structure. Longitudinal 3x12 planks for a foot-walk, the remaining ties not exceeding 7 feet in length; that every tie to be bolted at each end to the stringers. Prefers inner guard rails of angle irons placed about 6 inches clear of the rails and bolted to alternate ties, these guard-rails extending to embankment, and drawn gradually together, terminated by an acute-angled frog. The limit of pre-connected spans should not be less than 100 feet, but lattice girders, as ordinarily built, are ruled out, and single intersection triangular riveted girders used instead. Recommends organizing an association of bridge designers and builders for the purpose of discussing bridge design in all its details, with the ultimate adopting of standard bridge specifications, so complete that upon looking over a design any competent engineer can determine without any doubt whether the proposed structure be fully up to the specification in the most minute particular.

The paper by Bouscaren was read by Mr. Whittemore. The writer does not think it practicable to establish a standard rolling load, nor a standard bridge floor, on account of variable weights of locomotives and trains on different roads. He prefers creosoted ties to buckle ties. Would not consider it expedient and desirable that a standard load, wheel-base floor and guard be fixed by legislation, but it is of the greatest importance that proper inspection be enforced by the State or general Government. The writer stated also that the great trouble with bridges is that a majority of them were first built to suit the manager, who considered the bridge from a financial and not from the engineer's standard.

A paper by G. Lindenthal, of Pittsburg, was read in abstract by Mr. McMath. "Proper inspection should include measurements of all dimensions, computations, and careful and minute examination of all parts of bridges, and complete working drawings, supervision of the piling, rolling and furnishing of the iron or steel, and testing the same, shop work and erection. Mandatory legislation on the inspection and maintenance of bridges is not advisable when such expert engineers are appointed by the Government to inspect and control the designs. The experience in Europe proves plainly that it does not work well. The Tay Bridge in Scotland, which fell down six years ago, was built under the immediate supervision of Inspecting Engineers of the English Board of Trade." The writer advocated inspection by experts. It is desirable to adopt a standard specified rolling-load much heavier than now used, but no specified wheel base.

The paper by J. S. Dagon was read by Robert Moore. The writer does not favor either national or State legislation in this connection, as there is a strong likelihood that appointments would be made more on account of their political influence than of their professional standing, but the remedy lies with the railway companies themselves. On roads where a permanent expert cannot be employed one should be called in once a year. It is questionable whether a standard rolling-load should be adopted. A standard bridge floor should be strong enough to carry a derailed engine. Space between ties should not exceed four inches. The ties to be notched one-half inch over the stringer, every third tie being fastened to the guard-rail and stringer by a $\frac{3}{4}$ -inch bolt, and intermediate ties fastened to the guard-rails by $\frac{3}{4}$ -inch bolts; ties not less than 8 inches deep, guard rails 6x6 inches, and notched one-half inch over ties. I would suggest the appointment of a committee, taken from the society, to thoroughly study the question and to report at the next annual meeting or next annual convention.

The convention then adjourned *sine die*.

FRIDAY, JULY 8.—"Home, Sweet Home."

At an early hour this morning Hotel Kaaterskill presented a lively scene, as the members and guests were preparing to leave the pleasant association they have enjoyed for the past week.

Mr. W. F. Page, manager of the hotel, tried to anticipate the wants of the members, and endeavored to do all in his power to make this convention one long to be remembered by its participants.

It has been noticeable that the best of feeling prevailed on all sides during the convention—not one single jar occurred to mar the harmony of the meetings.

At half past 8 A. M. the members bid adieu to the Hotel Kaaterskill, taking the stages provided, and were soon after proceeding at a rapid rate down the mountains, reaching Kingston about 11:30, where a portion of the party left the train for Binne Water to examine the cement works by invitation of F. O. Norton.

Mr. Norton sent a representative, Mr. C. M. Harris, to the hotel to meet the members.

Mr. Norton has introduced the latest improved machinery in the manufacture of cement, and also is using compressed air for power to work the drills, which has materially reduced the cost of quarrying rock.

The headings now extend under the mountain about 1,000 feet. A bountiful lunch was provided by Mr. Norton, which all present heartily enjoyed.

After the inspection of the cement works and lunch over, the party returned to Kingston and left by West Shore train for New York, where they arrived early in the evening.

The last good bye was said and the Nineteenth Annual Convention passed into history.

Members and guests at Convention:

New York—W. G. Hamilton, Stevenson Towle, Miss Alice Towle, Miss Jennie Towle, Miss Edith M. Spicer, Mr. and Mrs. John Bogart, Mr. and Mrs. William E. Worthen, Hon. William J. McAlpine, Miss Amita McAlpine, Gen. G. S. Greene, Mr. and Mrs. T. E. Brown, Jr., Mr. and Mrs. H. R. Bradbury, Mr. J. J. R. Croes and Miss Croes, G. S. Greene, Jr., Carlton Green, E. B. Gosling, J. N. Green, William J. Haskins, C. W. Hunt, Mr. and Mrs. E. P. North, Mrs. Henry C. Meyer, Mr. and Mrs. E. B. Noyes, Frederick S. Odell, G. H. Pegrar, E. F. Pierson, H. G. Prout, D. McN. Stauffer, R. J. Sloan, A. W. Trotter, Mrs. J. F. Trotter, C. Tompkins, Mr. and Mrs. W. H. Wiley, Mr. and Mrs. A. M. Wellington and daughter, Miss E. G. Crans, C. G. Curtis, Theodore Cooper, Mr. and Mrs. B. S. Curch, E. B. Dorsey, J. P. Davis, S. B. Downes, Mr. and Mrs. P. P. Dickinson, Mr. and Mrs. C. W. Durham, Mrs. G. H. Frost and son, G. A. Just, Mr. and Mrs. J. F. Flagg, Miss Flagg, Mr. and Mrs. William Kent, T. B. Lee, G. W. McNulty, C. Kirchoff, Jr., J. T. Nichols, E. L. Abbott, J. W. Russell, C. H. Haswell, Mr. and Mrs. Wardlaw, Mr. and Mrs. H. C. Clarke, Miss Clarke, Miss L. C. Clarke, H. C. Clarke, Jr., Mr. and Mrs. J. Thompson, Mr. and Mrs. J. T. Louis, G. H. Thompson, Mr. and Mrs. C. C. Schneider, Miss Schneider, F. A. Calkins, T. J. Holloway, A. Bryson, H. T. Swan.

Brooklyn—Mr. and Mrs. C. C. Martin, Miss C. A. Martin, J. W. Adams, W. A. Brackenridge, G. Leverich, Buffalo—Mr. and Mrs. T. C. Smith, Mr. and Mrs. E. B. Guthrie, Mr. and Mrs. C. W. Wagner, G. S. Field, E. Hayes.

Albany—J. McNaughton, H. Andrews, Mr. and Mrs. G. Devin, H. L. Van Zell.

Troy—P. C. Ricketts.

Hudson—J. Bartholomew.

Rochester—E. Kuichling.

Ithaca—C. L. Crandall, R. H. Thurston.

Oswego—C. D. Ward.

Poughkeepsie—W. T. Booth, C. E. Fogg.

Ramapo—E. F. Pierson.

New Rochelle—Mr. and Mrs. C. W. Hunt.

Boston, Mass.—C. H. Swan, Mr. and Mrs. G. A. Kimball, Mr. and Mrs. F. L. Fuller, E. C. Clarke, Mr. and Mrs. F. P. Stearns, F. W. Hodgedom, F. O. Whitney, C. P. Allen, F. Brooks, Mr. and Mrs. J. R. Richards.

West Newton—A. F. Noyes.

Cambridgeport—W. S. Barbour, Miss Julia H. Barbour.

Waltham—William Roberts.

Providence, R. I.—F. Filley, U. S. N., Mr. and Mrs. G. C. Tingley, Mr. and Mrs. S. M. Gray.

New Haven, Conn.—A. B. Hill.

Waterbury, Conn.—N. J. Welton.

Danbury, Conn.—Mr. and Mrs. J. W. Bacon, Mr. and Mrs. R. S. Read.

Middletown, Conn.—G. H. Bishop.

Bangor, Me.—Mr. and Mrs. T. W. Baldwin.

Augusta, Me.—Captain O. E. Michaelis, U. S. A.

Elizabeth, N. J.—Mr. and Mrs. F. Collingwood.

Jersey City, N. J.—Mr. and Mrs. J. Houston, Mr. and Mrs. J. G. Van Horne, Miss Van Horne, L. B. Ward.

Trenton, N. J.—C. Fisher.

East Orange, N. J.—F. C. Prindle, U. S. N.

Philadelphia, Pa.—Mr. and Mrs. H. W. Wilson, W. L. Ferguson, Mr. and Mrs. F. Graff, W. Jones, H. B. Seaman, J. S. Ringwalt, T. Roberts, Mr. and Mrs. S. L. Snedley, Mr. and Mrs. H. C. Felton, Mr. and Mrs. J. M. Wilson.

Phoenixville, Pa.—Mr. and Mrs. A. Bonzaro, Mr. and Mrs. A. Coffin, Mr. and Mrs. E. L. Griffin, W. H. Burr, G. S. Sniffin, S. T. Wagner, J. Sterling, Mr. and Mrs. P. F. Reeves, Miss Reeves.

Pittsburg, Pa.—W. W. Card.

Bethlehem, Pa.—H. S. Goodwin.

Chambersburg, Pa.—C. Ives.

Swarthmore, Pa.—A. Beardsley.

Scranton, Pa.—J. Archibald, Miss Archibald.

Bethlehem, Pa.—M. Merriman.

League Island, Pa.—T. C. McCollom, U. S. N.

Blairsville, Pa.—A. P. Kirtland.

Baltimore, Md.—Mr. and Mrs. M. Cohen.

Washington, D. C.—Robert Russell, M. S. Endicott, U. S. N.

Richmond, Va.—Mr. and Mrs. C. P. E. Burgwyn.

Youngstown, O.—Mr. and Mrs. H. G. Morse.

Zanesville, O.—Mr. and Mrs. F. G. Darlington, Mrs. E. A. Greene and Miss Greene, Mrs. Buckingham and Miss Buckingham.

Columbus, O.—C. N. Brown, W. H. Jennings.

Toledo, O.—B. Reece.

Akron, O.—W. D. Chapman.

Detroit, Mich.—Mr. and Mrs. F. B. Howard, Mr. and Mrs. J. D. Hawks, Miss J. P. Cooke.

Saginaw, Mich.—G. S. Burrows.

Milwaukee, Wis.—Don J. Whittemore, Miss F. M. and M. L. Whittemore, E. Whittemore, Miss L. Barnes.

Chicago, Ill.—R. A. Spailer.

Cedar Rapids, Iowa—W. W. Walker.

Ottumwa, Iowa—W. W. Hegeman.

St. Louis, Mo.—R. E. McMath, J. B. Johnson, E. D. Meier, J. A. Ackerson, F. C. McMath, Robert Moore.

Rolla, Mo.—G. D. Emerson.
Liberty, Mo.—W. C. Wetherhill.
Louisville, Ky.—J. MacLeod.
St. Paul, Minn.—S. Rockwell.
Minneapolis, Minn.—G. W. Sublito.
Greenville, Miss.—William Starling.
Socorro, New Mexico—C. F. Allen.
Paris, France—Henri Oesinger.
Ottawa, Canada—T. C. Keefer.

Regarding the inadequacy of the house now occupied by the society, the following circular will be issued to all members:

"At an informal meeting held at the Hotel Kaaterskill on July 4, 1887, at which a number of the members of the society were present, the President, Mr. William E. Worthen, stated that the society has grown to such extent that the present house had become inadequate, particularly for the meetings and for the convenient use of the library, and that it seemed of great importance to the welfare of the society that something should be done either towards building an addition to the present house, or, if it were practicable, the purchase of larger and more commodious quarters.

"The following resolutions were adopted:

"Whereas, the accommodation of the present society building is entirely inadequate for the purposes of the society, and it is deemed advisable without delay either to provide new quarters or an enlargement of the present building,

"Resolved, That the members and friends of the society are urged to contribute to the Building Fund as they may be able, in order that immediate measures may be taken by the board to accomplish this object.

"Resolved, That the board in its discretion may expend a reasonable sum in an addition to the present building.

"The sum of \$5,225 was directly subscribed by gentlemen present. [The list of subscriptions is given below.]

"The Board of Direction desires to take measures either towards the enlargement of the present house, or towards the purchase of other property. The determination as to which of these courses shall be taken must depend largely upon the amount of subscriptions to the Building Fund which shall be received within a short time. The subject therefore is presented to the members and friends of the Society. The Board of Direction feels that something must be done, and asks such response as may aid it in determining what is for the best interests of the society."

Subscriptions under resolutions adopted at a meeting of members held at Hotel Kaaterskill July 4, 1887:

ANNUAL ADDRESS OF MR. WILLIAM E. WORTHEN, PRESIDENT OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

I WAS much gratified by my election as President of the American Society of Civil Engineers, a numerous body of men who fully represent the profession, and with whom I have been for a long time united. In assuming the office I undertook the duties of the position, which, however honorable, are not entirely without responsibility. I now proceed to fulfill one of the requirements by delivering an annual address, which is supposed to be a resume of what was done last year and the progress of the work of engineers, with some impressions of my own experience and my opinion with regard to the future.

I have collected sundry statistics from newspapers, magazines, etc., and although I have not credited them to the different parties, I yet follow the rule of the society in their publications, in not assuming the responsibility for the facts and opinions advanced, nor shall I back my opinions against facts if they are hereafter found in opposition thereto.

There is a little of the catastrophic in engineering science. It is essentially an evolved science; the works and facts from which it is evolved have been the accumulation of centuries; shrewd guesses or judgments worked out; a copying of examples; changing construction according to the teaching of experience, and application of varied material dependent upon location and requirements. Without going back into remote history, when the term engineer was not known, although there were wonderful examples of engineering construction, let us consider the growth of the science up to its present standpoint: Who built the first bridge? The change from wooden to iron structures is recent, yet how full is the record of steps? Who conceived the first railway? Its growth from the strap railway is wholly within our recollection. How many have contributed to make the turbine the wonderfully efficient and economic water-motor it now is? Who first thought of the application of steam to the purposes

of power? How many worked at the construction and improvement of boilers and steam-engines? We can pick out parts that were an essential improvement, and give the names of the men who first designed them, but the great body of the machine is made up of parts which have been constructed by mechanics without name, and not only the parts, but the machines to make the parts uniform and interchangeable.

Many an invention conceived before its time could be unearthed from patent records; either because it was not then needed, or the tools which made it economically and practicable were not to be had. How much development of industry has been given by the lathe, planer, and shaping machines? Seldom, if ever, in the lapse of a single year can we record any striking novelty which can be set down as a step in progress. It takes years to complete and practically test. Like the statue of "Liberty Enlightening the World," which is one of the accomplished facts of last year, it took many years to design, construct, and raise it. It is unfortunate, however, that in illuminating the world no provisions were made for illuminating the statue itself.

The name Engineer is of quite recent date, and is very mixed in its definition: the Architect preceded it. Architecture was always considered among the ancients as one of the liberal arts, but the name of architect was not given till a few centuries ago to artists charged with the construction of buildings. The man of the profession before the architect was the master of works, a practical builder; and work comprehended the entire building and its furniture. It is probable that the religious houses, which contained all that there were of men of letters, savants, and scholars on the Continent, furnished not only the men who designed and directed the monastic constructions, but also the civil ones, and perhaps military. The master of works became the head of a corps of workmen which made a part of these free corporations, which regulated wages and hours of labor, and defined rights and duties. Once outside of the cloister, work went on with great rapidity. The master workman was the acknowledged head; his name was connected with his work, and he was buried within the most prominent church he constructed. But the necessities of variation in designs and details soon brought in the artist and the architect, and something beside the construction of buildings was necessary.

In 1560-1641, Sully, Grand Master of Artillery and Superintendent of Finances of Henry the Fourth of France, was the first that appreciated the service that could be rendered by a body of geometicians and mathematicians, and he organized a *Corps de Genie*, which took the title of "*Ingenieurs Ordinaires du Roi*." This organization remained unchanged until the time of Colbert and Vauban, the latter the "*vrai pere de Genie Civil et Militaire*." L'Ecole Mezieres, established in 1748, was the first institution devoted to the development of the sciences. This was the period when the expression the "*Corps de Genie*" was introduced into the army. In England, the distinction between engineers became that of civil and military. It was evident in the discussion of the paper of Mr. Metcalf, on steel, before this society, that in the application of this material to the construction of guns and to civil purposes, no distinctions were drawn between the civil and the military, and the graduates from West Point are able civil engineers and fulfill that duty under the direction of the War Department. In general, the term engineer is supposed to come from engine, and the term engineer embraces not only the man who designs and constructs it, but the man who runs it. I suggest that there should be some distinction; that engineers should be such as are eligible to our society, and that the men who run and take charge of engines or machines should be called *engineers*. I want to reclaim, perhaps, a little more of "*le genie*" for the profession than for the mechanical artisan, for skill, experience, and industry may make a very good workman, but to this must be added more general and extended information in the application of materials to necessity, mathematics to calculate, and drawing to express, and, more than this, a sentiment of purpose, a feeling for the work. A true engineer is as much born as a poet. Could we divide the application of the term into engineer and engineers, it would be distinctive, and I would drop the term civil as embracing too large a profession, and adopt prefixes as military, hydraulic, railway, mechanical, steam, electric, and other divisions, when these are adopted as specialties. With regard to military engineering, I know of no particular progress of recent date. The War Department has undertaken to clear out Gedney's Channel, in New York Harbor, by pump dredging, and it is satisfactory to report that the work last year retained its depth without filling in, and a new contract has been entered into at about half the price of last year and is successfully progressing.

HYDRAULIC ENGINEERING.

Constructions for the use of water for power, city, and town supplies, hydraulic mining, and irrigation. In the census of 1880 will be found tabulated accounts of the water-power of the United States, developed and undeveloped. Attention is called to the low percentage of increase of water-power in comparison with that of steam:

In 1870, Water power, 1,130,431 H. P.	Steam, 1,315,711 H. P.
In 1880, " 1,225,379 "	" 2,185,418 "
Percentage of increase, 8.40	79.77

It will be seen that the percentage of increase of steam is very much in excess of that of water, but the latter still is not an inconsiderable amount, about 105,000 horse-power, equal to the power of the city of Lowell per year. A con-

venience of access to business and labor centres has tendered very largely to the increase of steam-power. And although there are immense water-powers yet undeveloped, and the cost of steam-power is largely in excess of that of water-power, yet position and its relations have decided in favor of steam. And where large manufactories have been commenced on water-power; and where the water-power has become exhausted, or very irregular, the business has been extended by the use of steam, rather than by a diversion of it to a new place for water. In 1844 I assisted Mr. U. A. Boyden in conducting his experiments on the first Fournayron turbines at the Appleton Mills, Lowell, Mass. This wheel gave 76 per cent. useful effect from the water, whilst some breast-wheels at Lowell, which Mr. Francis and myself tested some time before, gave from 60 to 66. Mr. Boyden afterward constructed many other turbines throughout the country, introducing many improvements in design and construction. One at Lawrence gave over 90 per cent. of effect. Boyden came of a very remarkable family, and had, above all men that I ever knew, that desirable genius, the genius of industry. He filled in all his time with scientific work and research. His relaxations consisted almost entirely of changes of subject. His improvements in water-wheels increased the water-power at Lowell about one-fourth over what was obtained by the former wheels, and gave him the means of pursuing other investigations of light, heat, sound, etc. His mode of experimenting was that now followed by Mr. Francis at Lowell and Mr. Mills at Lawrence. With the impulse given by Mr. Boyden, water-wheel shops were established in different parts of the country. The wheels were tested and improvements made, until now water-wheel construction has passed out of the hands of the engineers into those of manufacturers, who furnish wheels, ready made, simple efficient, and strong, guaranteed to give 80 per cent. effective power.

WATER-SUPPLY OF TOWNS.

There is a very large increase in the number of towns and cities supplied and addition to work already constructed. The great improvement in the matter of aqueducts has been in the application of wrought-iron for cast-iron mains, and also to take the place of masonry and tunneling. Large wrought-iron pipes for conducting water to turbines have been in use from the time of the introduction of the Boyden turbine wheel, but it has been left for California to largely extend its use for the conducting of water for hydraulic mining, irrigation and town supply with a boldness of design and execution which has astonished the engineer. The method of hydraulic mining was introduced or invented in California in 1852. The supply of water for these jets at first was conducted through hose made of heavy duck cotton cloth, which was strengthened by outer nettings of cordage when the pressure was large. In 1853, an ingenious miner laid in his mine a line of pipe consisting of ordinary stove-pipe, made of a very thin sheet-iron lightly fastened together with cold rivets, with the joints united stove fashion. This pipe was five or six inches in diameter. As hydraulic mining increased in magnitude the sizes of these supply-pipes also increased, the diameter for main lines for a large mine being from 22 to 30 inches. These pipes, as a rule, are made at the mine. The iron is from .055 to .134 inches (No. 16 to 10 Birm. gauge) in thickness, with a double row of cold rivets for the longitudinal seam when the pressure is to be large. As a protection against rust each joint is immersed for several minutes in a bath of boiling asphaltum and tar. They are now used for permanent conduits both for conducting water to mining districts across deep mountain gorges and also for the supply of cities. San Francisco, a place of some 300,000 inhabitants, receives its water through two lines of such pipes, and a third pipe, many miles in length and of large diameter, is now being laid for an additional supply. Within the last year one of the large shops in San Francisco has increased and improved its plant, so that they are now able to turn out weekly a mile of pipe 44 inches in diameter. Of the quantity of water necessary per inhabitant, there is considerable difference of opinion, but there is no doubt in the general opinion, that in the present use of water there is an extensive waste.

Of the quality of water for a town supply there is a great difference of opinion among chemists and scientists. M. Gerardin (*Rapport l'Alteration, la Corruption et l'Assainissement des Rivières*) says "the distinction between healthy waters and polluted ones cannot be detected by color, smell, taste, or chemical analysis. Water can be very much polluted without giving any smell. Such are the waters of paper-mills, starch and sugar works at the leaving of the works. Many natural waters which are prescribed in the case of sickness are very offensive in smell. Chemical analysis does not sufficiently explain the alteration of waters. If a perfectly healthy water be enclosed some time in a bottle, well-corked, its elementary analysis always manifests the same results, and, notwithstanding this, it has undergone radical change and has lost all its good qualities."

Chaptal says that those who make a chemical examination of waters only analyse its dead body. "Water is healthy when animals and vegetables of a superior organism can live in it; on the contrary, a water is affected when animals die, and it can only nourish infusoria. There is no better means of establishing the character of water than by determining if in this water fish and aquatic plants can live. If fish die there and plants perish there the character is certainly polluted, and the water should not be used for domestic purposes. On the contrary, if fish and aquatic plants can live in it the water can be considered good." There is an old French proverb, "*Il n'est pire eau que l'eau qui dort*," ("There is no worse

water than water which sleeps") which conveys the general impression with regard to the sources of supply. A running stream supplies the best water, and when reservoirs are necessary, the one from which the water is drawn directly should be as small as possible, and the water from superior reservoirs should flow down into it, so that the water may be well aerated in its course. Organisms are not dangerous because microscopic, and they are not, as a rule, dangerous. It is only, as an eminent scientist observed, when germs of disease are introduced from the outside, that the waters become dangerous, and organisms actually contribute largely to the purification of the water. If, by the doctrine that water once polluted is always polluted, it is to be understood that these pollutions are accumulations from century to century, then, for the preservation of our species, our own organisms must be changed to adapt us to the circumstances, and, in our new evolution, we should not be suited to the air and water of the garden of Eden and its suburbs. M. Gerardin, in the work above quoted, speaking of algæ, says they are endowed with a very active respiration. "The oxygen which they accumulate decomposes rapidly organic matter and they contribute largely to the purification of waters polluted by organic matters in decomposition. From the biological examination of the waters of various streams that are polluted by paper mills, and sugar, starch, and glue works, as it leaves the works and at different stages of the stream below, he finds that cryptogams and algæ first begin to appear, and thus up through the variety of forms to the higher and higher organisms, until fish appear in its waters and plants along its shore." Experiments in aquaria confirm this conclusion. I would refer to the report on pisciculture of James B. Ferguson, Commissioner of the United States at the Paris Universal Exposition of 1878, on the value of the algæ. He says: "Oxygen in its native state, resulting from the respiration of vegetable and especially from microscopic algæ, is very soluble in water. Atmospheric air introduced mechanically into water is not dissolved there, or if so in very small quantities." He quotes also from the Superintendent of the Aquarium his experiments on the aeration of waters supplied, as follows:

"The water of the Vanne, taken almost from its source, contains consequently little air and no organic germs; hence, although very useful for the cleansing and purification of the basins, it was not suitable to favor the rapid development of a cryptogamous vegetation upon the sides of the tanks. I substituted, therefore, the waters of the Seine, the color of which was, at that time, green on account of the abundance of microscopic germs, spores of algæ, conferva, and, in fact, all those vegetable aquatics—for the most part microscopic—the presence of which is requisite for the continuous oxygenation of water intended to receive fish. In truth, upon water as well as upon air, has been imposed that great law of nature which counterbalances and equalizes the animal and the vegetable kingdoms, making the one the indispensable auxiliary of the other.

"Fish, as well as animals on land, absorb oxygen by respiration, and give out carbonic acid, the quantity of which always increasing in the place which they inhabit, would not fail to produce asphyxia if the aquatic vegetable were not present to produce a chemically inverse effect. Under the influence of solar radiation the green immersed particles absorb carbonic acid, decompose it, assimilate the carbon, and exhale the oxygen, which appears upon their surface in innumerable small bubbles, supplying the fish with the respiratory element, renewed and endowed with a vital action so much the more efficacious because just brought to life, and possessing a solubility much greater than that of oxygen drawn from the atmosphere.

"Perhaps there is even a formation of bioxide of hydrogen, which would explain this coefficient of solubility as being so much greater than that admitted by chemists. However that may be, for me the fact is now incontestable that to establish in an aquarium a hygienic medium suitable for the life of aquatic animals, an abundant vegetation must there be developed, which should frequently undergo the action of solar radiation."

Most successful aquaria are constructed with what may be termed closed circuits, not drawing water from an exterior supply, except to make up waste. Water is used over again by aerating it in its circulation. C. B. Brush, a member of our society, has written a paper which will be read before the society, of experiments in forcing air into water by means of air-pump pressure at the Hackensack works, as he claims, with success.

Whether the cucumber taste of the Croton water be due to the *spongilla lacustrine* or to *nostoclonia*, it seems to me to be rather due to the want of circulation, and the decay and decay of some organism, by which the balance of aquarial life has not been properly kept up. The pabulum has failed, and perhaps it might be remedial to introduce a little sewage, as it has been shown by analysis that the sewage at Troy improves the water of the Hudson, and that the water-supply at Albany is better than that above. The algæ called frogs' spittle, *Batrachosperma moniliforme* (I might here remark, the smaller the organism the bigger the name), will always be found in the purest spring water. I am pleased to see them, and feel more sure of the purity of water by the presence of such common organisms than by their absence, understanding that within the microcosm there is a class of organism which depends on the usual food supplied by nature. Disturbance means disease, if not death. *Post hoc* is not always *propter hoc*; don't at once ascribe disease to the presence of an organism; and when you see crows or buzzards hovering around the carcass of a

horse, don't come to the conclusion that they have killed a valuable animal and shoot the crow or buzzard.

In the early times of gold-mining in California, hydraulic mining was the rule, but with the increase of value for agricultural purposes, the disturbance of rivers, and the covering of land with debris, this has been found very objectionable, and water has taken a value for irrigation, but with irrigation developments the necessity of defining water-rights has become indispensable, and a law was passed creating the office of State Engineer, and duties were assigned opening a large field of inquiry over an immense territory. The field of work is in the nature of a physical survey of the State combined with certain industrial, social, and other inquiries of a broad scope, and necessary to be prosecuted over a wide field.

The first part of the report has now come out, and it is for sale by the State of California. "It is introductory to the study of problems of irrigation, and is composed of a series of studies of irrigation development in the three countries of France, Italy, and Spain, from whose experience we propose to learn something for our own immediate purposes." We have referred to this report not only for its value in matters treated, but because like necessity exists in all our States to define the rights of water-users, whether for power or town supply, the drainage of land for agricultural purposes and sometimes irrigation, and in the discharge of polluted matter from streams. In whom does the title to water lie? Is it the first user? When the large city takes the entire flow of contiguous rivers and streams, whence is the fast increasing suburban population to be supplied, and once taken has any town or city the right to deprive others of this by waste? In 1883 an act was introduced into the New Jersey Legislature to provide for the appointment of commissioners to determine on plans for the storage of any of the waters of this State for the purpose of furnishing to cities and towns a joint water-supply. With regard to this commissioners were appointed and a small amount of money was provided for expenses. The report was made, but no further action was taken. The commission is still in existence, but without power or money. In 1886 an act was passed by the Commonwealth of Massachusetts, requiring from the Board of Health a report on the condition and means for protecting inland waters. A report has been made under his act. This year a new bill was introduced to establish a Board of Water Commissioners, to provide for the establishment of water companies, and the general supervision of drainage connected with inland waters. Such boards are necessary in every State, not only to define the uses of water and the removal of waste within the limits of the State, but also there are interstate rights, and you can readily understand that the majority of such boards should be hydraulic engineers and with such powers as the State can delegate.

STEAM ENGINEERING.

In 1857, Mr. Charles W. Copeland and myself made the first experiments on pumping-engines at Belleville, N. J., and Hartford, Conn. (published in the *Brooklyn Water Works*, and issued by the City of Brooklyn). It may be remarked that the evaporation of the boilers from water at 100° will still be considered a very fair evaporation. But the duty per 100 pounds of coal was 55,000,000 to 62,000,000 on the Hartford engine and 68,000,000 to 73,000,000 on the Cornish engine at Belleville, now very much below the duty of first-class pumping engines. From the above experiments Mr. Kirkwood felt authorized to require by contract for the first Brooklyn engine a duty of 60,000,000 pounds per 100 pounds of coal. It is not now unusual to require 100,000,000 pounds or one-horse power for a little less than two pounds of coal per hour, and this taken on the water end of the machine. First-class pumping engines are now invariably compounded, and compounds have also been largely introduced in stationary engines and with largely economic results; of their exact comparative economy we need more tests.

When steam was first introduced for the heating of cotton mills, a boiler was placed at each end of the mill, with automatic water-feed by means of balance float. Later the boilers were concentrated within one house and the steam distributed through ranges of immense mills. The original steam-heating pipes were cast-iron, about three to four inches in diameter, and suspended from the ceiling; later, with the introduction of wrought-iron pipe, the pipe was carried around the walls of the mill, near the floor, but at present the wrought-iron steam-pipes are suspended from the ceiling. In mills where large quantities of steam are used for other purposes than power, it is common to pass the steam through a steam-engine for power, and then use the exhaust for drying, boiling, and heating. In 1866 I made a report to the Merrimack Manufacturing Company, of Lowell, on the economy of using steam first for power at the cotton mills and afterwards the exhaust at their print works for the purposes of heating, boiling, etc., and reported on the advisability of passing the steam through engines of 1,200 horse-power, and using the exhaust-steam afterwards in the print works, with a back-pressure of about six pounds, and that the amount of coal properly chargeable to power in this case would not exceed one pound of coal per horse-power per hour. It was a success, and of its present extent the superintendent of the works writes me as follows: "We have only one pair (34x72) condensing engine on our premises; all the others (something over 100 cylinders) exhaust into a system of mains, from which we draw all the heat we require. What we do not require for heat we take into the condensing cylinders, before mentioned, and reconvert into power." Some time since there was a boom in the

steam-heating of towns and cities from central stations, and many plants were constructed the most of which have gone out. There are still two in New York City, one of moderate size, comparing fairly well in extent with that of a large cotton mill plant; the other is very large and is still increasing its distribution. This result seems to argue the survival of the fittest.

RAILROADS.

There has been substantial progress in the extension of railroads, in the construction of new roads, and doubling and quadrupling the old ones. The estimation of construction for the year is 10,000 miles. The compound locomotive has been tested in Europe, but not sufficiently to afford a fair test of its practical value, and has not been put in operation here. The public has been greatly exercised by numerous accidents in the destruction of cars and passengers by fire, and our legislators have called for a safer means of heating and lighting than at present in use; in New York one year is given for the change. The two great questions of automatic freight-train brakes and automatic freight-car couplers have made great progress during the past year. The freight-brake tests which were made at Burlington, Iowa, in July of last year, have been supplemented by a second series this year; the two series together being by far the most complete tests of the kind which have ever been made. The results demonstrated that only air-brakes are adapted to the requirements. The prominent part of this year's tests was that taken by electricity as an actuating agent for applying the brakes, with results showing great benefit from its use, both in quickness of stop and in avoiding the dangerous shocks which result from quick stops with long trains. The electric application being absolutely simultaneous throughout the train, no shock whatever results. The occasional failures of the electric apparatus during the test indicated that further improvements are still needed, but as electricity simply supplements the air, which acts as usual in case of an electric failure, the probability seems strong that such electric application will be a feature of the train-brake of the future, while a percentage of efficiency was shown in this year's test, much greater than was ever shown before. As a safeguard for human life, rapid progress has been made toward the introduction of automatic freight-car couplers. The Burlington brake tests of this year and last show that it was on the whole decidedly beneficial to eliminate loose slack between trains which has tended to exclude couplings of the link and pin type, and the final step has now been taken by the formal adoption by the Master Car Builders' Association of the Janney hook coupler and others of the same type coupling with it as standards of the association, by a vote of 33 to 14.

STREET RAILWAYS.

The entire service of street railways was for many years by the means of horses, and we quote as to the cost of working the following returns taken from the sixteenth annual report of the Massachusetts Board of Railroad Commissioners: Highland, Lynn and Boston, Metropolitan, Middlesex, and South Boston; number of horses owned, 6,158; number of miles run, 11,287,196; number of passengers carried, 68,196,776; average number of passengers carried per round trip, 43.4.

From the above it appears that the stable average daily distance traveled by the above horses equals 10.04 miles.

The average number of passengers per round trip being 43.4, per single trip equals 21.7. Averaging them at 140 pounds, equals 3,038 pounds. Add weight of car, 4,800 pounds, equals 7,838 pounds.

With the great extension of street roads there have been found great inconveniences in this horse service, not only in the cost, but in the location of immense stables within populous neighborhoods. The usual traction force has been reckoned to be about $\frac{1}{10}$ per cent. in movement, and from 6 to 7 per cent. in starting on level grades. This will afford us a means of comparison between different forms of motors.

Although the cable road was used on the London and Blackwall Railroad for many years and for heavy trains, it was superseded by the locomotive, but it has of late years been revived in this country for the distribution of city travel and with great success.

Chicago has 20 $\frac{1}{4}$ miles of cable road in operation and 22 under construction; Cincinnati, 8 miles; Kansas City, 4 miles in operation and 30 under construction; New York City, 10 $\frac{1}{2}$ in operation; Philadelphia, 18 miles; St. Louis, 6 miles; San Francisco, 33 $\frac{1}{2}$ miles now in use; Melbourne, Victoria, has several miles; London, 3 miles, and four years ago a road was built in New Zealand. The first cable road in San Francisco was opened in 1873. This was the famous "Clay Street Hill Cable Road," where the grades were so steep that property was almost valueless. The cables had no trouble with the grades, 17 feet in 100, where horse power was useless and the road was an immediate success.

Mr. W. H. Paine, M. Am. Soc. C. E., has furnished me with the following facts in regard to the cable on the Brooklyn Bridge which he laid: "The practicability of applying cables to the hauling of large heavy passenger cars in trains at considerable speed with shorter headway, greater regularity and less danger from accident than any other method known is here demonstrated.

"The durability of the cable, and of the grips and dies has been here so great as to remove a most serious objection to cable traction.

Speed of cable, 10 miles per hour.

Length of cable, 11,000 feet.

Size of cable, 1 $\frac{1}{2}$ inches in diameter.

Weight, 3 $\frac{1}{2}$ pounds per lineal foot.

"The first cable was taken out last November, after having been in use three years and 41 days, having hauled 1,675,790 cars, 48,108,567 passengers, or 22,196,436 tons. The heaviest cars weigh 16 tons when empty, the heaviest load of passengers about 10 tons. The lightest cars weigh 11 tons when empty. Three cars are now hauled in one train. Shortest headway about 1 $\frac{1}{4}$ minutes. More than 100,000 passengers have been carried in one day. The grips will last for years with few repairs. The dies or lining of the grips last more than four months, sometimes exceeding five months. The speed of the cable, which is 10 miles per hour, could be increased, but without increasing the carrying capacity of the road."

ELECTRIC RAILWAYS

for street passenger traffic seem now to be a fixed fact. In Europe electric street railways are now carrying at the rate of 3,000,000 annually, and probably a little in excess of that number here, and they are extending. The first built was in Berlin, Germany, 1881, 1 $\frac{1}{2}$ miles in length. In this country they date from 1885. The following are the places in which they are established in this country. Baltimore, Md.; Los Angeles, Cal.; Port Huron, Mich.; Windsor, Canada; Detroit, Mich.; Appleton, Wis.; Scranton, Pa.; Denver, Col.; Montgomery, Ala. In all but one of these, the dynamo is driven by a steam-engine, but in Appleton, Wis., there is a road of $\frac{1}{4}$ miles, where water-power is used. You may recollect that an eminent divine once remarked as an evidence of design in the works of the Creator, that great rivers were placed near great cities. It were fortunate for the purpose of lighting and heating if great water-powers were placed in the vicinity of large populous districts. It has not yet been sufficiently decided how far power can be carried by means of electricity, nor the size of the conductor and the loss in conducting it. With the short roads now in operation it has been said that the percentage of effect on the car is 50 per cent. to 55 per cent. of that of the steam-engine providing the power. In this respect it is superior to the cable, which is fast superseding horses.

Few of the present engineers recollect the experiment of the old atmospheric railway of Samuda, which ran from Dublin to Kingston, about 1 $\frac{1}{2}$ miles, successfully for many years; and was later tried in a larger way from London to Croydon and from Paris to St. Germain. It failed and was superseded by the locomotive. It may be that for a moderate distance the atmospheric road may become practicable, but for the present our hopes of a successful motor, especially for city and town roads, are based on electricity. So much at least has been directed to this subject, not only with reference to power, but to light and heating, that a new branch of engineering has sprung up and has inaugurated itself into a society like our own as the American Institute of Electrical Engineers. From our knowledge of them and their claims I feel satisfied that they are to be a worthy branch of engineers. In our own country capitalization in electrical districts, telegraphic, telephonic, electric lighting, and electric power, amounts to a sum of at least \$350,000,000. There are in America about 700,000 miles of telegraphic wire; last year 32,000,000 conversations were held on the telephone; there are over 150,000 arc lamps, and incandescents verging on a million, and at least 15,000 electric motors for fans and sewing machines.

BRIDGES.

The first Howe truss was built across the Connecticut River at Springfield, Mass., in 1840. It was a wooden bridge with double intersections. Smaller bridges had been built in the same line of road, but this was a very important bridge at the time. Howe was a carpenter and the bridge was designed by average judgment, and the construction of one bridge made the precedent for another. Engineering science was not then applied to the calculating of stresses. Undue confidence in the form of truss, and the successful construction of many bridges in wood led to the Ashtabula accident. The strong desire for the construction of iron bridges at minimum cost, and the high price of iron, led to the construction of weak designs of this material, and postponed its adoption for many years. With the reduction of the price of iron, and a better understanding of the principles of construction, iron bridges have almost entirely superseded the wooden ones.

The forms have been calculated and tested by years of practical use, and they are furnished by engineering bridge companies in lengths to suit, and guaranteed to resist the stresses required. The finding of the jury in the Bussey Bridge disaster on the Boston & Providence Railroad is acknowledged to have been just, but this is not likely to occur with bridges as at present furnished, and subjected to careful inspection on the part of railroads. The limit of span has not yet been reached, nor perhaps the admissible height of skeleton piers, nor any form of truss or suspension established as the best. Cantilevers, from the ease of their erection without false works, are largely used, but esthetically in form they do not compare with the arch; yet extended use and knowledge of their "fitness for function" will soon reconcile one to the form.

GAS ENGINEERING.

Much has been done by improvements in mechanics and chemistry to increase the product of gas and reduce its cost. Water-gas is largely manufactured, and its uses extended in forging and welding. It is to be hoped that it may be distributed by mains throughout cities for the purposes of heating buildings and cooking. And although from experiment it has been demonstrated that water-gas has but 65 per cent. of the thermic value of the coal from

of power? How many worked at the construction and improvement of boilers and steam-engines? We can pick out parts that were an essential improvement, and give the names of the men who first designed them, but the great body of the machine is made up of parts which have been constructed by mechanics without name, and not only the parts, but the machines to make the parts uniform and interchangeable.

Many an invention conceived before its time could be unearthed from patent records; either because it was not then needed, or the tools which made it economically and practicable were not to be had. How much development of industry has been given by the lathe, planer, and shaping machines? Seldom, if ever, in the lapse of a single year can we record any striking novelty which can be set down as a step in progress. It takes years to complete and practically test. Like the statue of "Liberty Enlightening the World," which is one of the accomplished facts of last year, it took many years to design, construct, and raise it. It is unfortunate, however, that in illuminating the world no provisions were made for illuminating the statue itself.

The name Engineer is of quite recent date, and is very mixed in its definition: the Architect preceded it. Architecture was always considered among the ancients as one of the liberal arts, but the name of architect was not given till a few centuries ago to artists charged with the construction of buildings. The man of the profession before the architect was the master of works, a practical builder; and work comprehended the entire building and its furniture. It is probable that the religious houses, which contained all that there were of men of letters, savants, and scholars on the Continent, furnished not only the men who designed and directed the monastic constructions, but also the civil ones, and perhaps military. The master of works became the head of a corps of workmen which made a part of these free corporations, which regulated wages and hours of labor, and defined rights and duties. Once outside of the cloister, work went on with great rapidity. The master workman was the acknowledged head; his name was connected with his work, and he was buried within the most prominent church he constructed. But the necessities of variation in designs and details soon brought in the artist and the architect, and something beside the construction of buildings was necessary.

In 1560-1641, Sully, Grand Master of Artillery and Superintendent of Finances of Henry the Fourth of France, was the first that appreciated the service that could be rendered by a body of geometers and mathematicians, and he organized a *Corps de Genie*, which took the title of "*Ingenieurs Ordinaires du Roi*." This organization remained unchanged until the time of Colbert and Vauban, the latter the "*vrai pere de Genie Civil et Militaire*." L'Ecole Mezieres, established in 1748, was the first institution devoted to the development of the sciences. This was the period when the expression the "*Corps de Genie*" was introduced into the army. In England, the distinction between engineers became that of civil and military. It was evident in the discussion of the paper of Mr. Metcalf, on steel, before this society, that in the application of this material to the construction of guns and to civil purposes, no distinctions were drawn between the civil and the military, and the graduates from West Point are able civil engineers and fulfill that duty under the direction of the War Department. In general, the term engineer is supposed to come from engine, and the term engineer embraces not only the man who designs and constructs it, but the man who runs it. I suggest that there should be some distinction; that engineers should be such as are eligible to our society, and that the men who run and take charge of engines or machines should be called *engineers*. I want to reclaim, perhaps, a little more of "*le genie*" for the profession than for the mechanical artisan, for skill, experience, and industry may make a very good workman, but to this must be added more general and extended information in the application of materials to necessity, mathematics to calculate, and drawing to express, and, more than this, a sentiment of purpose, a feeling for the work. A true engineer is as much born as a poet. Could we divide the application of the term into engineer and engineers, it would be distinctive, and I would drop the term civil as embracing too large a profession, and adopt prefixes as military, hydraulic, railway, mechanical, steam, electric, and other divisions, when these are adopted as specialties. With regard to military engineering, I know of no particular progress of recent date. The War Department has undertaken to clear out Gedney's Channel, in New York Harbor, by pump dredging, and it is satisfactory to report that the work last year retained its depth without filling in, and a new contract has been entered into at about half the price of last year and is successfully progressing.

HYDRAULIC ENGINEERING.

Constructions for the use of water for power, city, and town supplies, hydraulic mining, and irrigation. In the census of 1880 will be found tabulated accounts of the water-power of the United States, developed and undeveloped. Attention is called to the low percentage of increase of water-power in comparison with that of steam:

In 1870, Water power,	1,130,431 H. P.	Steam,	1,315,711 H. P.
In 1880,	1,225,379 "	"	2,184,418 "
Percentage of increase,	8.40	"	79.77

It will be seen that the percentage of increase of steam is very much in excess of that of water, but the latter still is not an inconsiderable amount, about 105,000 horse-power, equal to the power of the city of Lowell per year. A con-

venience of access to business and labor centres has tended very largely to the increase of steam-power. And although there are immense water-powers yet undeveloped, and the cost of steam-power is largely in excess of that of water-power, yet position and its relations have decided in favor of steam. And where large manufactories have been commenced on water-power; and where the water-power has become exhausted, or very irregular, the business has been extended by the use of steam, rather than by a diversion of it to a new place for water. In 1844 I assisted Mr. U. A. Boyden in conducting his experiments on the first Fournayron turbines at the Appleton Mills, Lowell, Mass. This wheel gave 76 per cent. useful effect from the water, whilst some breast-wheels at Lowell, which Mr. Francis and myself tested some time before, gave from 60 to 66. Mr. Boyden afterward constructed many other turbines throughout the country, introducing many improvements in design and construction. One at Lawrence gave over 90 per cent. of effect. Boyden came of a very remarkable family, and had, above all men that I ever knew, that desirable genius, the genius of industry. He filled in all his time with scientific work and research. His relaxations consisted almost entirely of changes of subject. His improvements in water-wheels increased the water-power at Lowell about one-fourth over what was obtained by the former wheels, and gave him the means of pursuing other investigations of light, heat, sound, etc. His mode of experimenting was that now followed by Mr. Francis at Lowell and Mr. Mills at Lawrence. With the impulse given by Mr. Boyden, water-wheel shops were established in different parts of the country. The wheels were tested and improvements made, until now water-wheel construction has passed out of the hands of the engineers into those of manufacturers, who furnish wheels, ready made, simple efficient, and strong, guaranteed to give 80 per cent. effective power.

WATER-SUPPLY OF TOWNS.

There is a very large increase in the number of towns and cities supplied and addition to work already constructed. The great improvement in the matter of aqueducts has been in the application of wrought-iron for cast-iron mains, and also to take the place of masonry and tunneling. Large wrought-iron pipes for conducting water to turbines have been in use from the time of the introduction of the Boyden turbine wheel, but it has been left for California to largely extend its use for the conducting of water for hydraulic mining, irrigation and town supply with a boldness of design and execution which has astonished the engineer. The method of hydraulic mining was introduced or invented in California in 1852. The supply of water for these jets at first was conducted through hose made of heavy duck cotton cloth, which was strengthened by outer nettings of cordage when the pressure was large. In 1853, an ingenious miner laid in his mine a line of pipe consisting of ordinary stove-pipe, made of a very thin sheet-iron lightly fastened together with cold rivets, with the joints united stove fashion. This pipe was five or six inches in diameter. As hydraulic mining increased in magnitude the sizes of these supply-pipes also increased, the diameter for main lines for a large mine being from 22 to 30 inches. These pipes, as a rule, are made at the mine. The iron is from .055 to .134 inches (No. 16 to 10 Birm. gauge) in thickness, with a double row of cold rivets for the longitudinal seam when the pressure is to be large. As a protection against rust each joint is immersed for several minutes in a bath of boiling asphaltum and tar. They are now used for permanent conduits both for conducting water to mining districts across deep mountain gorges and also for the supply of cities. San Francisco, a place of some 300,000 inhabitants, receives its water through two lines of such pipes, and a third pipe, many miles in length and of large diameter, is now being laid for an additional supply. Within the last year one of the large shops in San Francisco has increased and improved its plant, so that they are now able to turn out weekly a mile of pipe 44 inches in diameter. Of the quantity of water necessary per inhabitant, there is considerable difference of opinion, but there is no doubt in the general opinion, that in the present use of water there is an extensive waste.

Of the quality of water for a town supply there is a great difference of opinion among chemists and scientists. M. Gerardin (*Rapport l'Alteration, la Corruption et l'Assainissement des Rivières*) says "the distinction between healthy waters and polluted ones cannot be detected by color, smell, taste, or chemical analysis. Water can be very much polluted without giving any smell. Such are the waters of paper-mills, starch and sugar works at the leaving of the works. Many natural waters which are prescribed in the case of sickness are very offensive in smell. Chemical analysis does not sufficiently explain the alteration of waters. If a perfectly healthy water be enclosed some time in a bottle, well-corked, its elementary analysis always manifests the same results, and, notwithstanding this, it has undergone radical change and has lost all its good qualities."

Chaptal says that those who make a chemical examination of waters only analyse its dead body. "Water is healthy when animals and vegetables of a superior organism can live in it; on the contrary, a water is affected when animals die, and it can only nourish infusoria. There is no better means of establishing the character of water than by determining if in this water fish and aquatic plants can live. If fish die there and plants perish there the character is certainly polluted, and the water should not be used for domestic purposes. On the contrary, if fish and aquatic plants can live in it the water can be considered good." There is an old French proverb, "*Il n'est pire eau que l'eau qui dort*," ("There is no worse

water than water which sleeps") which conveys the general impression with regard to the sources of supply. A running stream supplies the best water, and when reservoirs are necessary, the one from which the water is drawn directly should be as small as possible, and the water from superior reservoirs should flow down into it, so that the water may be well aerated in its course. Organisms are not dangerous because microscopic, and they are not, as a rule, dangerous. It is only, as an eminent scientist observed, when germs of disease are introduced from the outside, that the waters become dangerous, and organisms actually contribute largely to the purification of the water. If, by the doctrine that water once polluted is always polluted, it is to be understood that these pollutions are accumulations from century to century, then, for the preservation of our species, our own organisms must be changed to adapt us to the circumstances, and, in our new evolution, we should not be suited to the air and water of the garden of Eden and its suburbs. M. Gerardin, in the work above quoted, speaking of algæ, says they are endowed with a very active respiration. "The oxygen which they accumulate decomposes rapidly organic matter and they contribute largely to the purification of waters polluted by organic matters in decomposition. From the biological examination of the waters of various streams that are polluted by paper mills, and sugar, starch, and glue works, as it leaves the works and at different stages of the stream below, he finds that cryptogams and algæ first begin to appear, and thus up through the variety of forms to the higher and higher organisms, until fish appear in its waters and plants along its shore." Experiments in aquaria confirm this conclusion. I would refer to the report on pisciculture of James B. Ferguson, Commissioner of the United States at the Paris Universal Exposition of 1878, on the value of the algæ. He says: "Oxygen in its native state, resulting from the respiration of vegetable and especially from microscopic algæ, is very soluble in water. Atmospheric air introduced mechanically into water is not dissolved there, or if so in very small quantities." He quotes also from the Superintendent of the Aquarium his experiments on the aeration of waters supplied, as follows:

"The water of the Vanne, taken almost from its source, contains consequently little air and no organic germs; hence, although very useful for the cleansing and purification of the basins, it was not suitable to favor the rapid development of a cryptogamous vegetation upon the sides of the tanks. I substituted, therefore, the waters of the Seine, the color of which was, at that time, green on account of the abundance of microscopic germs, sporules of algæ, conferva, and, in fact, all those vegetable aquatics—for the most part microscopic—the presence of which is requisite for the continuous oxygenation of water intended to receive fish. In truth, upon water as well as upon air, has been imposed that great law of nature which counterbalances and equalizes the animal and the vegetable kingdoms, making the one the indispensable auxiliary of the other.

"Fish, as well as animals on land, absorb oxygen by respiration, and give out carbonic acid, the quantity of which always increasing in the place which they inhabit, would not fail to produce asphyxia if the aquatic vegetable were not present to produce a chemically inverse effect. Under the influence of solar radiation the green immersed particles absorb carbonic acid, decompose it, assimilate the carbon, and exhale the oxygen, which appears upon their surface in innumerable small bubbles, supplying the fish with the respiratory element, renewed and endowed with a vital action so much the more efficacious because just brought to life, and possessing a solubility much greater than that of oxygen drawn from the atmosphere.

"Perhaps there is even a formation of bioxide of hydrogen, which would explain this coefficient of solubility as being so much greater than that admitted by chemists. However that may be, for me the fact is now incontestable that to establish in an aquarium a hygienic medium suitable for the life of aquatic animals, an abundant vegetation must there be developed, which should frequently undergo the action of solar radiation."

Most successful aquaria are constructed with what may be termed closed circuits, not drawing water from an exterior supply, except to make up waste. Water is used over again by aerating it in its circulation. C. B. Brush, a member of our society, has written a paper which will be read before the society, of experiments in forcing air into water by means of air-pump pressure at the Hackensack works, as he claims, with success.

Whether the cucumber taste of the Croton water be due to the *spongilla lacustrine* or to *nostochonia*, it seems to me to be rather due to the want of circulation, and the decrease and decay of some organism, by which the balance of aquarial life has not been properly kept up. The pabulum has failed, and perhaps it might be remedial to introduce a little sewage, as it has been shown by analysis that the sewage at Troy improves the water of the Hudson, and that the water-supply at Albany is better than that above. The algæ called frogs' spittle, *Batrachosperma moniliforme* (I might here remark, the smaller the organism the bigger the name), will always be found in the purest spring water. I am pleased to see them, and feel more sure of the purity of water by the presence of such common organisms than by their absence, understanding that within the microcosm there is a class of organism which depends on the usual food supplied by nature. Disturbance means disease, if not death. *Post hoc* is not always *propter hoc*; don't at once ascribe disease to the presence of an organism; and when you see crows or buzzards hovering around the carcass of a

horse, don't come to the conclusion that they have killed a valuable animal and shoot the crow or buzzard.

In the early times of gold-mining in California, hydraulic mining was the rule, but with the increase of value for agricultural purposes, the disturbance of rivers, and the covering of land with *debris*, this has been found very objectionable, and water has taken a value for irrigation, but with irrigation developments the necessity of defining water-rights has become indispensable, and a law was passed creating the office of State Engineer, and duties were assigned opening a large field of inquiry over an immense territory. The field of work is in the nature of a physical survey of the State combined with certain industrial, social, and other inquiries of a broad scope, and necessary to be prosecuted over a wide field.

The first part of the report has now come out, and it is for sale by the State of California. "It is introductory to the study of problems of irrigation, and is composed of a series of studies of irrigation development in the three countries of France, Italy, and Spain, from whose experience we propose to learn something for our own immediate purposes." We have referred to this report not only for its value in matters treated, but because like necessity exists in all our States to define the rights of water-users, whether for power or town supply, the drainage of land for agricultural purposes and sometimes irrigation, and in the discharge of polluted matter from streams. In whom does the title to water lie? Is it the first user? When the large city takes the entire flow of contiguous rivers and streams, whence is the fast increasing suburban population to be supplied, and once taken has any town or city the right to deprive others of this by waste? In 1883 an act was introduced into the New Jersey Legislature to provide for the appointment of commissioners to determine on plans for the storage of any of the waters of this State for the purpose of furnishing to cities and towns a joint water-supply. With regard to this commissioners were appointed and a small amount of money was provided for expenses. The report was made, but no further action was taken. The commission is still in existence, but without power or money. In 1886 an act was passed by the Commonwealth of Massachusetts, requiring from the Board of Health a report on the condition and means for protecting inland waters. A report has been made under his act. This year a new bill was introduced to establish a Board of Water Commissioners, to provide for the establishment of water companies, and the general supervision of drainage connected with inland waters. Such boards are necessary in every State, not only to define the uses of water and the removal of waste within the limits of the State, but also there are interstate rights, and you can readily understand that the majority of such boards should be hydraulic engineers and with such powers as the State can delegate.

STEAM ENGINEERING.

In 1857, Mr. Charles W. Copeland and myself made the first experiments on pumping-engines at Belleville, N. J., and Hartford, Conn. (published in the *Brooklyn Water Works*, and issued by the City of Brooklyn). It may be remarked that the evaporation of the boilers from water at 100° will still be considered a very fair evaporation. But the duty per 100 pounds of coal was 55,000,000 to 62,000,000 on the Hartford engine and 68,000,000 to 73,000,000 on the Cornish engine at Belleville, now very much below the duty of first-class pumping engines. From the above experiments Mr. Kirkwood felt authorized to require by contract for the first Brooklyn engine a duty of 60,000,000 pounds per 100 pounds of coal. It is not now unusual to require 100,000,000 pounds or one-horse power for a little less than two pounds of coal per hour, and this taken on the water end of the machine. First-class pumping engines are now invariably compounded, and compounds have also been largely introduced in stationary engines and with largely economic results; of their exact comparative economy we need more tests.

When steam was first introduced for the heating of cotton mills, a boiler was placed at each end of the mill, with automatic water-feed by means of balance float. Later the boilers were concentrated within one house and the steam distributed through ranges of immense mills. The original steam-heating pipes were cast-iron, about three to four inches in diameter, and suspended from the ceiling; later, with the introduction of wrought-iron pipe, the pipe was carried around the walls of the mill, near the floor, but at present the wrought-iron steam-pipes are suspended from the ceiling. In mills where large quantities of steam are used for other purposes than power, it is common to pass the steam through a steam-engine for power, and then use the exhaust for drying, boiling, and heating. In 1866 I made a report to the Merrimack Manufacturing Company, of Lowell, on the economy of using steam first for power at the cotton mills and afterwards the exhaust at their print works for the purposes of heating, boiling, etc., and reported on the advisability of passing the steam through engines of 1,200 horse-power, and using the exhaust-steam afterwards in the print works, with a back-pressure of about six pounds, and that the amount of coal properly chargeable to power in this case would not exceed one pound of coal per horse-power per hour. It was a success, and of its present extent the superintendent of the works writes me as follows: "We have only one pair (34x72) condensing engine on our premises; all the others (something over 100 cylinders) exhaust into a system of mains, from which we draw all the heat we require. What we do not require for heat we take into the condensing cylinders, before mentioned, and reconvert into power." Some time since there was a boom in the

steam-heating of towns and cities from central stations, and many plants were constructed the most of which have gone out. There are still two in New York City, one of moderate size, comparing fairly well in extent with that of a large cotton mill plant; the other is very large and is still increasing its distribution. This result seems to argue the survival of the fittest.

RAILROADS.

There has been substantial progress in the extension of railroads, in the construction of new roads, and doubling and quadrupling the old ones. The estimation of construction for the year is 10,000 miles. The compound locomotive has been tested in Europe, but not sufficiently to afford a fair test of its practical value, and has not been put in operation here. The public has been greatly exercised by numerous accidents in the destruction of cars and passengers by fire, and our legislators have called for a safer means of heating and lighting than at present in use; in New York one year is given for the change. The two great questions of automatic freight-train brakes and automatic freight-car couplers have made great progress during the past year. The freight-brake tests which were made at Burlington, Iowa, in July of last year, have been supplemented by a second series this year; the two series together being by far the most complete tests of the kind which have ever been made. The results demonstrated that only air-brakes are adapted to the requirements. The prominent part of this year's tests was that taken by electricity as an actuating agent for applying the brakes, with results showing great benefit from its use, both in quickness of stop and in avoiding the dangerous shocks which result from quick stops with long trains. The electric application being absolutely simultaneous throughout the train, no shock whatever results. The occasional failures of the electric apparatus during the test indicated that further improvements are still needed, but as electricity simply supplements the air, which acts as usual in case of an electric failure, the probability seems strong that such electric application will be a feature of the train-brake of the future, while a percentage of efficiency was shown in this year's test, much greater than was ever shown before. As a safeguard for human life, rapid progress has been made toward the introduction of automatic freight-car couplers. The Burlington brake tests of this year and last show that it was on the whole decidedly beneficial to eliminate loose slack between trains which has tended to exclude couplings of the link and pin type, and the final step has now been taken by the formal adoption by the Master Car Builders' Association of the Janney hook coupler and others of the same type coupling with it as standards of the association, by a vote of 33 to 14.

STREET RAILWAYS.

The entire service of street railways was for many years by the means of horses, and we quote as to the cost of working the following returns taken from the sixteenth annual report of the Massachusetts Board of Railroad Commissioners: Highland, Lynn and Boston, Metropolitan, Middlesex, and South Boston; number of horses owned, 6,158; number of miles run, 11,287,196; number of passengers carried, 68,196,776; average number of passengers carried per round trip, 43.4.

From the above it appears that the stable average daily distance traveled by the above horses equals 10.04 miles.

The average number of passengers per round trip being 43.4, per single trip equals 21.7. Averaging them at 140 pounds, equals 3,038 pounds. Add weight of car, 4,800 pounds, equals 7,838 pounds.

With the great extension of street roads there have been found great inconveniences in this horse service, not only in the cost, but in the location of immense stables within populous neighborhoods. The usual traction force has been reckoned to be about $\frac{1}{8}$ per cent. in movement, and from 6 to 7 per cent. in starting on level grades. This will afford us a means of comparison between different forms of motors.

Although the cable road was used on the London and Blackwall Railroad for many years and for heavy trains, it was superseded by the locomotive, but it has of late years been revived in this country for the distribution of city travel and with great success.

Chicago has 20 $\frac{1}{2}$ miles of cable road in operation and 22 under construction; Cincinnati, 8 miles; Kansas City, 4 miles in operation and 30 under construction; New York City, 10 $\frac{1}{2}$ in operation; Philadelphia, 18 miles; St. Louis, 6 miles; San Francisco, 33 $\frac{1}{2}$ miles now in use; Melbourne, Victoria, has several miles; London, 3 miles, and four years ago a road was built in New Zealand. The first cable road in San Francisco was opened in 1873. This was the famous "Clay Street Hill Cable Road," where the grades were so steep that property was almost valueless. The cables had no trouble with the grades, 17 feet in 100, where horse power was useless and the road was an immediate success.

Mr. W. H. Paine, M. Am. Soc. C. E., has furnished me with the following facts in regard to the cable on the Brooklyn Bridge which he laid: "The practicability of applying cables to the hauling of large heavy passenger cars in trains at considerable speed with shorter headway, greater regularity and less danger from accident than any other method known is here demonstrated.

"The durability of the cable, and of the grips and dies has been here so great as to remove a most serious objection to cable traction.

Speed of cable, 10 miles per hour.

Length of cable, 11,000 feet.

Size of cable, 1 $\frac{1}{2}$ inches in diameter.

Weight, 3 $\frac{1}{2}$ pounds per lineal foot.

"The first cable was taken out last November, after having been in use three years and 41 days, having hauled 1,675,790 cars, 48,108,567 passengers, or 22,196,436 tons. The heaviest cars weigh 16 tons when empty, the heaviest load of passengers about 10 tons. The lightest cars weigh 11 tons when empty. Three cars are now hauled in one train. Shortest headway about 1 $\frac{1}{4}$ minutes. More than 100,000 passengers have been carried in one day. The grips will last for years with few repairs. The dies or lining of the grips last more than four months, sometimes exceeding five months. The speed of the cable, which is 10 miles per hour, could be increased, but without increasing the carrying capacity of the road."

ELECTRIC RAILWAYS

for street passenger traffic seem now to be a fixed fact. In Europe electric street railways are now carrying at the rate of 3,000,000 annually, and probably a little in excess of that number here, and they are extending. The first built was in Berlin, Germany, 1881, 1 $\frac{1}{2}$ miles in length. In this country they date from 1885. The following are the places in which they are established in this country. Baltimore, Md.; Los Angeles, Cal.; Port Huron, Mich.; Windsor, Canada; Detroit, Mich.; Appleton, Wis.; Scranton, Pa.; Denver, Col.; Montgomery, Ala. In all but one of these, the dynamo is driven by a steam-engine, but in Appleton, Wis., there is a road of $\frac{1}{4}$ miles, where water-power is used. You may recollect that an eminent divine once remarked as an evidence of design in the works of the Creator, that great rivers were placed near great cities. It were fortunate for the purpose of lighting and heating if great water-powers were placed in the vicinity of large populous districts. It has not yet been sufficiently decided how far power can be carried by means of electricity, nor the size of the conductor and the loss in conducting it. With the short roads now in operation it has been said that the percentage of effect on the car is 50 per cent. to 55 per cent. of that of the steam-engine providing the power. In this respect it is superior to the cable, which is fast superseding horses.

Few of the present engineers recollect the experiment of the old atmospheric railway of Samuda, which ran from Dublin to Kingston, about 1 $\frac{1}{2}$ miles, successfully for many years; and was later tried in a larger way from London to Croydon and from Paris to St. Germain. It failed and was superseded by the locomotive. It may be that for a moderate distance the atmospheric road may become practicable, but for the present our hopes of a successful motor, especially for city and town roads, are based on electricity. So much at least has been directed to this subject, not only with reference to power, but to light and heating, that a new branch of engineering has sprung up and has inaugurated itself into a society like our own as the American Institute of Electrical Engineers. From our knowledge of them and their claims I feel satisfied that they are to be a worthy branch of engineers. In our own country capitalization in electrical districts, telegraphic, telephonic, electric lighting, and electric power, amounts to a sum of at least \$350,000,000. There are in America about 700,000 miles of telegraphic wire; last year 32,000,000 conversations were held on the telephone; there are over 150,000 arc lamps, and incandescents verging on a million, and at least 15,000 electric motors for fans and sewing machines.

BRIDGES.

The first Howe truss was built across the Connecticut River at Springfield, Mass., in 1840. It was a wooden bridge with double intersections. Smaller bridges had been built in the same line of road, but this was a very important bridge at the time. Howe was a carpenter and the bridge was designed by average judgment, and the construction of one bridge made the precedent for another. Engineering science was not then applied to the calculating of stresses. Undue confidence in the form of truss, and the successful construction of many bridges in wood led to the Ashtabula accident. The strong desire for the construction of iron bridges at minimum cost, and the high price of iron, led to the construction of weak designs of this material, and postponed its adoption for many years. With the reduction of the price of iron, and a better understanding of the principles of construction, iron bridges have almost entirely superseded the wooden ones.

The forms have been calculated and tested by years of practical use, and they are furnished by engineering bridge companies in lengths to suit, and guaranteed to resist the stresses required. The finding of the jury in the Bussey Bridge disaster on the Boston & Providence Railroad is acknowledged to have been just, but this is not likely to occur with bridges as at present furnished, and subjected to careful inspection on the part of railroads. The limit of span has not yet been reached, nor perhaps the admissible height of skeleton piers, nor any form of truss or suspension established as the best. Cantilevers, from the ease of their erection without false works, are largely used, but esthetically in form they do not compare with the arch; yet extended use and knowledge of their "fitness for function" will soon reconcile one to the form.

GAS ENGINEERING.

Much has been done by improvements in mechanics and chemistry to increase the product of gas and reduce its cost. Water-gas is largely manufactured, and its uses extended in forging and welding. It is to be hoped that it may be distributed by mains throughout cities for the purposes of heating buildings and cooking. And although from experiment it has been demonstrated that water-gas has but 65 per cent. of the thermic value of the coal from

which it is manufactured, yet when the cartage and the storage of coal is taken into account, together with the curtailing of hours of consumption by gas to the time necessary for the purpose, and the economy in the application of gas, there seems to be a fair presumption that, sooner or later, water-gas will be used for heating and cooking. In fact, from the great waste of heat in lighting by gas, and its cost, there perhaps might be some economy in converting the heat of water-gas into power through an engine, and into light by a dynamo, rather than directly by carburetted hydrogen into light.

SANITARY ENGINEERING.

Of late years this branch of the profession has been recognized. It embraces the construction of sewers, the removal of sewage, and its purification, or rather offense from it, and the plumbing and heating and ventilation of houses. The construction of sewers has long belonged to the department of hydraulic engineering, sometimes by the combined and sometimes by the separate system, the general aim being to remove sewage speedily from the town or city, and to points remote from settled neighborhoods, and, if possible, discharge it into a large body of flowing water. Of the offense in the matter of smell from sewage, there is no doubt; but that it is so dangerous to life and detrimental to health as is often claimed, I have just doubt from a large experience and from evidence of experts before court.

I have said in the earlier part of my address that the engineer is born like the poet, sculptor, painter or any other artist, but that he is cradled on palpable material and nursed on facts, not metaphysical ideas, of "I think, therefore, I am," or even the syllogism of the second order of differences, "I think, I think, therefore I think I am," but I am an engineer, and must think, and work. It is not necessary for him that he should believe either in the corpuscular or the wave theory of light, or in the atom whose weight is 1, the first unit in the 22 place of decimals of a gramme, or that pressure is due to the immense velocity of atoms in motion, or that even bodies fall by attraction of gravitation or some later discovered force. If these present theories enable him to recollect facts, they serve their purpose. It is sufficient for the engineer to know the laws of force, to be able to resist or use them; $v = gt$ or $v^2 = 2gs$ supplies him with the laws of gravitation even if he cannot understand the why.

The works of the engineer involve higher responsibilities than any other profession; he is to build, suitably, with materials at his disposal, solidly and securely for the prevention of accidents and for the protection of passengers, and economically in cost. He is to draw from his own and the experience of others, but he should not try experiments at another's cost, without a full understanding with the parties employing him.

As an expert, he must testify to facts, and the party who retains him must accept his facts, as they may be brought out in evidence, whether they are for or against them. It were better that the expert were attached to the court and not retained by either plaintiff or defendant. The construction of the law depends on the ruling of the judge. The value of the facts, from his point of view, should be settled by the engineer. As an umpire between the capitalist and contractor, his decision should be impartial, and if, by his own error, either party has been put to an unnecessary expense, acknowledge the fault, and, as far as possible, remedy it, but where such responsibility is taken, the price should be commensurate.

From the position of the engineer as umpire between the capitalist and contractor, and his large employment and familiar intercourse with mechanics and laborers, he would naturally be the proper party to adjudicate in disputes between labor and employer, and perhaps it would be so were the present troubles between labor and capital. But the strife is to see whether labor cannot support another class; chapters, president, officers, walking delegates and the like. These troubles come up in every country, and in every age; they are like the measles, whooping cough fever, cholera, in the microcosmi. Ours, at present, is an imported disease; the diagnosis of the suppression of the individual, of boycott, etc., are entirely un-American. It is not our own labor, but the imported labor that is striving, not for a chance for labor, but rather for a life without labor. There is no country in the world where labor is so well paid, so well clothed, well fed and well housed. We have taken in an immense immigration, and still are, and have endeavored, by making them citizens, to assimilate them rapidly into our body corporate. This should be a question of time. It is a common phrase to say one has bitten off more than he can chew. How much more sad our case when we have swallowed more than we can digest! The great panacea seems to be land; some of us have worked land, and think if land were given to us instead of bread it would be the gift of a stone, but, if properly applied, it might relieve our present labor trouble. Let every immigrant be sent at once into the country and furnished a cabin and ten acres of land, without tax, as there is to be hereafter no titles to land, and support himself and family ten years on the land. At the end of that time the majority would prefer the work and wages of a day laborer, especially in the city, and all would be better citizens. Syndicates of labor are as proper organizations as syndicates of capital or of employers, and syndicates can only be met by syndicates. Properly organized, they are not expensive and are efficient; but individuals should have perfect freedom to do as they please with their labor or capital, within the limits of law, and must be protected by law and a healthy public sentiment.

The Secretary has furnished the following statement of the present (June 22) membership of the Society:

	Resident.	Non-Resident.	Total.
Honorary Members.....	3	5	8
Corresponding.....	3	3	6
Members.....	161	632	793
Associates.....	11	34	45
Juniors.....	28	92	120
	201	766	969
Fellows 64, of whom 6 members are included above, leaving.....			58
Subscribers to the Building Fund, 140, of whom 90 are entered in one or other of the above classes, and deceased, leaving.....			50
Total now connected with the Society.....			1066

Whence are we to draw our future membership to maintain the ranks of our society? In answer, a distinguished professor and engineer has kindly furnished me the following statistics:

"There are in the United States 360 colleges and universities, which, besides classical and other courses, teach technology, and have given diplomas on technical professional subjects to 1,058 graduates. There are besides 49 schools, working under the 'Land Grant,' with 593 teachers and 4,644 students, of whom about 600 were technical graduates. In addition to these there are 39 private technical institutions with nearly 300 teachers and over 7,000 students, 800 of whom received technical diplomas. Statistics of this kind are very difficult to obtain, but it may be said that our higher schools of science turn out about 2,500 men per year, and of these about seven per cent. are engineers."

It becomes us, who are conversant with the needs of our profession, to advise that before entering our technological institutes, students should have a good school training, such as is required in entering classical universities, and that within the institutes they shall know, not only what to learn, but also how to learn. Then in their outer world progress, they may know how to accumulate knowledge useful to themselves in their profession, and reciprocate for the information and pleasure of those with whom they are thrown in contact.

In the earlier part of my address I claimed for the origin of our name, Engineer, *le genie*—genius; but genius, inborn, is derived from the Greek *gune*, woman, and I trust that there is no profession which has a higher respect or greater love for that name than our profession, whether as mother, sister, wife, or companion in the halcyon days of youth, or, in maturer years, our origin, protection, comfort, and inspiration. We trust that they will always attend our annual outings, intended not only for interchanges of views in matters of our profession, but also as a relief from business, a union for the establishing of a more general acquaintance, and cementing the bonds between the members of the A. S. C. E.

THROUGH two unaccountable blunders on the part of the types, which were not detected until a portion of our edition had been printed, we were made to say, in our report last week of the banquet to members of American Society Civil Engineers at Hotel Kaaterskill, that the number of covers laid was 1,300, while the actual number was 130; and further on the names of two of the toasts and those who responded were curiously mixed.

The toast, "Our Past Presidents," was responded to by General George S. Greene, and that entitled "The Pioneer in Engineering" was responded to by Mr. W. J. McAlpine.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

A NEW HOISTING-ENGINE.

WE herewith present a new hoisting-engine, the invention of Mr. Irving G. Hooper, and manufactured and for sale by Mr. Alexander Traud, of Newark, N. J.

It is a friction-clutch machine, intended for the rough usage to which such machines are ordinarily subjected, and is made with as few parts as is consistent with such a machine.

The bed of the machine, and all the journal-boxes, are cast in one piece, so as to avoid the use of bolts or other fastening devices to hold parts together that are better as a whole. This form of construction also insures the parts remaining in line, which is an important item in an apparatus subject to such a constant jar as a winch.

A special point of its construction, however, is the friction-clutch, the detail of which is partly shown. Two long segments, which form a friction-ring, are forced outwards by means of four toggles, which hinge into them and which form the struts, the inner ends of which are engaged in like manner with two friction-blocks, which

engage the friction-cone. The arbor of the windlass is hollow, and through it works a smaller shaft that gives motion to the friction-cone, by means of hand-lever shown in the front of the elevational illustration. The cone is fastened to the hollow arbor by a key which passes through both cone and arbor, having an inch or so lateral movement in the arbor. The small shaft, which is simply a loose rod, comes against the key when pushed into the arbor by the hand-lever; thrusting the cone

against its friction-blocks, which in turn give thrust to the toggles. The hand-lever, as before intimated, is not attached to the centre rod of the arbor, but engages it by a short screw of coarse pitch, which works within a nut and cap on the side of the windlass-journals. A quarter of a revolution of this screw gives the cone a forward motion of one-half inch and admits of almost unlimited pressure between the surfaces. It also admits of instantaneous relief when released.

The four springs shown in the detail take up the slack motion on the friction-gears.

A sheet of vulcanized fibre is interposed between the friction-surfaces at the rim of the wheels, which can be

readily removed and renewed, as it requires no festening being simply laid into place.

The machine may be changed from double to single gear in a few minutes by unskilled labor. By loosening the cap-screws the caps may be thrown back on the hinges shown in the engraving, in which position they form brackets that hold the gear-shaft out of place, when the machine may be run with single gear direct from the main shaft. This is to provide for one machine doing light or heavy work.

At a recent trial-trip of the new steamer "New York," of the Day Line to Albany, the rate of speed attained was 24 miles per hour. It is claimed that the speed of the "Mary Powell" is 25 miles per hour, but a well-informed professional man stated that her speed is less than 22 miles per hour.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITION.

THE Board of Public Lands and Buildings will receive plans and specifications at any time before August 1, 1887, at 2 P. M., for the Hospital for the Incurable Insane, at Hastings, Neb. Building to be 3-story brick, with stone basement, and not to cost over \$75,000, including steam-heating and plumbing. The right is reserved to reject any or all plans submitted. G. L. Laws, Secretary.

PORTLAND, ME.—F. H. Fassett, architect, of Portland, Me., has been selected as the designer of the Soldiers' Monument at that place.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE CONTRACTING ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 173-174-175-176.

WATER, SEWERAGE, ETC.

JEFFERSONVILLE, KY.—The firm of Samuel R. Bullock & Company, of New York City, offer to lay ten miles of pipe, and place 10 plugs, ten to the mile, for fire service. They also offer free water to the city for flushing streets and alleys, and for the use of a given number of fountains to be erected at the city's cost.

FORT SMITH, ARK.—The City Council has received a report and estimate for a system of sewerage, placing the cost of the main sewer and flush-tanks at \$17,500, and the cost of laterals at \$10,000.

FAIRFIELD, ME.—The Waterville Water Company has made a proposition looking to supplying this place with water.

ALLEGHENY, PA.—The Water Committee's report to Council will recommend the establishing of a filter-plant.

MOUNT HOLLY, N. J.—Steps are being taken to organize a new water company here.

PITTSBURG, PA.—The construction of the Negley Run sewer has been abandoned.

SYRACUSE, N. Y.—Mayor Burns has vetoed the ordinance granting a franchise to the Salmon River and Onondaga Water Company.

LITTLE ROCK, ARK.—An ordinance granting a franchise to the Arkansas Water Company is now pending in the Board of Aldermen.

NEW ALBANY, IND.—The Water-Works Company has issued \$50,000 in bonds. The funds derived from the sale of the bonds are to be applied to the laying of a twenty-inch main from the reservoir on the Knobs up Spring to Vincennes Street.

MEMPHIS, TENN.—The Artesian Water Company offers to construct a system of water-works. The communication is signed by R. C. Graves, President; John Johnson, Chairman; Napoleon Hill, John W. Dillard, S. H. Brooks, and W. T. Bowdler. They propose to furnish pure and wholesome water for both public and private purposes.

MILLBURY, MASS.—has petitioned the Worcester Council to furnish them a supply of water from Worcester mains.

GRAND RAPIDS, MICH.—The Supreme Court has dissolved the injunction which the city obtained to restrain the Grand Rapids Hydraulic Company from laying pipes in the streets, and it is believed work on the new water-supply will begin very soon.

JERSEYVILLE, ILL.—The contract for building water-works has been awarded to G. C. Morgan, of Chicago, at \$29,988.

SLEEPY EYE, MINN.—A complete system of water-works will be put in, bonds already having been sold.

ST. CLOUD, MINN.—E. T. Sykes & Co., of Minneapolis, have been awarded contract for extending sewerage system for \$10,000; work to be done in sixty days.

PLYMOUTH, MASS.—A town meeting July 7 voted to adopt a plan for a water-supply, proposed by the Water Commissioners, which is to divide the supply into a high and low service, the business portion of the town being furnished with the natural gravity head of about forty-five feet, and the high levels of the town will be supplied by the present pumping service on separate mains.

CATONSVILLE, MD.—The Catonsville Water Company have elected the following officers for the ensuing year: President, Joseph M. Cone; Secretary, Melvin Cone; Treasurer, Dr. C. G. Macgill; Directors, Joseph M. Cone, Melvin Cone, Charles D. Baker, John Hubner, and Dr. C. G. Macgill. \$23,000 of stock has already been subscribed. It is contemplated to extend the supply of water to Carroll, on the Frederick pike, some distance below, in the direction of Baltimore.

FLUSHING, N. Y.—The U. S. Government has accepted the proposition of the Trustees of this village to supply the military post at Willets' Point with water. The work is to be completed by the 1st of November next, this village carrying the mains to the Government

lines near Garrison's Hotel at Little Bayside—the Government laying the pipes on the post, and paying \$5,000 per year for a daily supply of 60,000 gallons for two years, and thereafter \$3,000 per annum. For any excess of 60,000 gallons used the Government is to pay extra by meter measurement.

CHICAGO.—An ordinance has been drawn authorizing the Commissioner of Public Works to advertise for bids for building a new tunnel, also new water-works on the South Side. Rudolph Hering, Consulting Engineer, and Mr. Artington, City Engineer, favor the scheme.

WEST BAY CITY, MICH., is agitating the question of sewerage.

SAULT STE. MARIE, MICH., will have a sewerage system.

MARLETTE, MICH., will vote July 28 on the question of building sewers.

MILWAUKEE.—Water-pipes will be laid on the following streets: Howell Avenue, from Lincoln Avenue to Clarence Street, 17th Ward; Farwell Avenue, from Maryland Avenue to North Avenue; Twenty-eighth Street, from Cedar Street to Watertown Road; Fifteenth Street, from Villet to Galena Streets; South Pierce Street, from Clinton to Reed Streets; Arlington Place, from Brady Street to Warren Avenue.

SAN BUENAVENTURA, CAL., has voted to issue \$200,000 of city bonds for building sewers.

MACON, GEO.—The contract for a supply of water for five years was awarded to the Macon Gas and Water Company, and the contract signed by the Mayor July 9.

MANKATO, MINN.—The city is advertising for proposals on 6-inch and 10-inch pipe sewers. A special election will probably be held soon to vote on the issue of bonds for a water-supply, general sewerage system, and park improvement. A report on sewerage has been presented by F. S. Blodgett.

CHRYVENNE, WYO.—Steps will be taken to enlarge the water-supply. Address Mayor River.

READING, PA.—The Water Board has concluded to put in two filters at a cost of \$30,000. They will purify 2,000,000 gallons daily.

WATER-WORKS will be built at the following cities and towns: Independence, Cal.; Marlin, Tex.; Wilton, Iowa; Griffin, Geo.; Chardron, Tex.

OSAGE CITY, KAN.—The Osage City Water Company has been incorporated; Thomas J. McKee, George B. Iman, William F. Iman, of New York City.

BAKERSFIELD, CAL.—A scheme is under way to construct irrigation reservoirs on Kern River and Walker Basin Creek, and a canal to convey the water to the valleys.

FRANKLIN, ME.—Town meeting has indefinitely postponed the consideration of the proposition of the Farmington Water Company to furnish a supply of water.

TORONTO, CAN.—Tenders will shortly be called for the construction of a large sewer in the north-east part of the city known as the Rosedale Creek. It will be one of the main intercepting sewers in the final scheme of the main drainage of the city. Another large intercepting sewer, over a mile in length, will also be commenced this year on Blair Street; it will connect with the Garrison Creek sewer, and drain about 100 acres. Rosedale sewer will drain about 100 acres. City Engineer Sproatt, the chairman, and some members of the Committee on Works, are visiting the larger cities in the Union to look into points connected with roadways, foot pavements, sewers and other matters connected with municipal engineering.

LEBANON, PA.—Mr. Harvey Tyson, of Reading, has been engaged to furnish estimates and superintend the temporary water-works to be constructed east of this city.

PROVIDENCE, R. I.—Mayor Robbins sends a communication to the City Council urging the speedy taking of steps to carry out the plan of sewerage presented by the City Engineer.

COUNCIL GROVE, KAN.—Inman Bros., of New York City, are building water-works for the company, having a 25-years' franchise from the city. There will be 4 miles of pipe, 40 hydrants, with stand-pipe. The water will be obtained from a well.

MILWAUKEE, WIS.—The Milwaukee Water Works Construction Company has been incorporated by George S. Bartlett, George P. Miller and Henry P. Ellis. The capital stock is \$300,000, divided into shares of \$100 each, and the purposes for which the corporation is organized are the building, renting, operating, purchasing or selling of water-works and gas-works, together with all supplies needed in the construction, extension or repair of the same, together with the manufacture of pipe generally and pipe for use in water and gas works.

APPLETON, WIS.—The City Council has declared the contract with the Water-Works Company void.

CHICAGO.—On July 11 the Aldermen decided that the water-tunnel should be constructed. It will be about 4 miles long.

TRENTON, N. J.—The City Council has passed an ordinance providing for the construction of two intercepting sewers. This is regarded as a beginning to carry out the plans prepared some time since by Mr. Rudolph Hering, now of Chicago.

MONTICELLO, FLA.—The City Engineer has made plans for a sewerage system.

PARIS, KY.—Address W. P. Chambers about water-works here.

ALBANY, GEO.—Water-works will be built here. Address Robert Hobbs and John A. Davis.

ELSINORE, CAL.—The Elsinore Land and Water Company filed articles of incorporation recently, to buy, sell, own, and control water rights, lands, etc. The principal place of business is to be at Elsinore, and the corporation is to exist fifty years. The capi-

tal stock is \$110,000, of which \$103,220 has been subscribed. The incorporators and the directors for the first year are, J. D. Vocum, N. G. Vocum, J. B. Young, M. C. Starbuck, and Ira S. France.

MILLEDGEVILLE, ILL.—Address Samuel Walker about water-works here.

ALLEGHENY, PA.—The committee on water has decided to have a reservoir built on the side of one of the intrenchments built in the Gettysburg campaign days of 1863.

MONTROSE, COL.—Water-works surveys are being made.

ST. CLOUD, MINN.—A sewerage system has been planned by F. T. Todd, City Engineer.

LOS ANGELES, CAL.—Address Freeman G. Teed, about sewers to be constructed here.

PORT HURON, MICH.—See our "Proposal Column" in regard to pumping engines for the city.

SPARTANBURG, S. C.—Messrs. Moffett, Hodgkins & Clarke, of Watertown, N. Y., propose to build water-works at this place shortly.

GOLDSBORO, N. C.—The water-works for this city will be built by Messrs. Moffett, Hodgkins & Clarke.

WEATHERFORD, TEX.—This city is contemplating the erection of water-works.

CHICAGO.—We have noticed above the definite action in favor of a new water-works tunnel. This will involve a new pumping plant, the site of which is now being discussed.

AUSTIN, MINN.—Plans and specifications are now being prepared for bidders on water-works.

FLORENCE, KAN.—The Cypress Water-Works Company has been organized. Andrew Brown, President, M. B. Shelton, Vice-President, and J. B. White, Secretary and Treasurer.

LENEX, MASS., is considering the raising of funds to complete the sewer system.

LANCASTER, PA.—The city has selected the plan No. 2, presented by J. J. R. Croes, C. E., of New York City, which provides for moving the water-works further up stream.

BEAVER DAM, WIS.—Incorporated is the Beaver Dam Water-Works Company; J. W. Mead and M. Warren, incorporators.

GAS, STEAM, BUILDINGS, ETC.

DAPHNE, ALA.—W. Stewart will receive bids for building a court-house and jail at Daphne, Ala., until July 25.

AKRON, O.—Proposals are to be advertised for heating apparatus for the Second Ward School Building.

ANN ARBOR, MICH.—A company will drill for gas.

YPSILANTI, MICH., will have electric lights for street lighting.

ALTOONA, PA., will receive proposals for lighting the streets until August 1.

WEATHERFORD, TEX.—The City Council is negotiating for the building of gas-works.

BIRMINGHAM, ALA.—Incorporated is the Alabama Automatic Water-Gas Company, to manufacture gas under the Sloper patents. George C. Kelley, C. C. Ashe, Amzi Godden, W. S. McConnell, Fred Slom, are among the directors.

READING, PA.—A charter has been granted to the Reading Steam Heat and Power Company, with a capital stock of \$100,000, all of which is already taken. The company will shortly commence laying mains.

LINDSEY, O.—The Lindsey Natural-Gas and Oil Company has been incorporated and has given a contract to Ederburn & Boynton to sink a gas-well.

NEW LEXINGTON, O.—The village has contracted with the Union Electric Construction Company, of New Jersey, for electric-lamps on the Thomson-Houston system.

ROCHESTER, PA.—The Baden Natural-Gas Company, of Pittsburgh, has contracted to furnish natural-gas to the Rochester Heat and Light Company for Rochester, Beaver, and Bridgeport.

JAMESTOWN, DAK.—The Council has decided to advertise for bids for electric-lights, giving the successful bidder an exclusive franchise for ten years, and the privilege of using the streets for another ten years. The city will expend not more than \$800 per year for street-lighting at the start.

COLUMBUS, O.—Incorporated are the Newark Electric-Light and Power Company, capital stock \$20,000; the Scioto Natural-Gas and Oil Company, increase of capital stock from \$5,000 to \$50,000.

AUSTIN, TEX.—Organized is the Austin Water, Light and Power Company. It will add to its electric light plant.

RAILROADS, BRIDGES, CANALS.

DURAND, MICH.—Fast Saginaw capitalists have formed a company to build a railroad to this place.

CHIPPewa FALLS, WIS.—The preliminary survey of the Chippewa Falls and Ashland Railway, southern end, is being pushed. T. C. Pound, L. C. Stanley, and Colonel Rush are at Ashland to start a surveying party from there. One of the main objects of this road is to open up a timber line, as it will traverse a heavy pine region, much of which is too far from the main streams to be accessible to them.

ROCHESTER, N. Y.—Incorporated is the Rochester Electrical Railway Company, to build street railways; Asa T. Soule, James B. Perkins, H. D. McNaughton, C. B. Judson, Bernard P. Smith, Henry Brinker, Directors.

RICHMOND, VA.—The stockholders of the Virginia Construction Company will meet here, July 10, to re-organize for the building of the Tennessee Midland Railroad. R. H. Temple, Chief Engineer, is already advertising from the Memphis, Tenn., office of the Construction Company for bids on graduation, masonry, bridges, trestles, ties, etc., for 135 miles of road. The date of opening is July 25.

CHICAGO and Gulf Air-Line Railroad will be built. C. C. Werrick, of Chicago, is president.

RAILROAD.—The Chicago, Jefferson City, Girard, and El Paso Railroad has been incorporated at Topeka, Kan. The principal office will be at Girard, Kan. Hugh McMillan and W. Gow, of Chicago, James B. Rice and S. W. Cox, of Jefferson, Mo., are among the directors.

LAWRENCE, MASS.—The committee on Union Street Bridge will reject all bids for rebuilding the stone piers.

ST. PAUL, Black Hills, and Pacific Railway will be built at once. Address S. P. Jumper, President.

ST. LOUIS, MO.—Merchants' Bridge and Terminal Company will soon begin work on the bridge over the Mississippi. Address Major Rainwater.

BOSTON.—Proposals will soon be advertised for a \$500,000 bridge over the Charles River, between Boston and Cambridge.

CONCORD, N. H.—A bill now before the New Hampshire Legislature provides for the incorporation of the Vermont and New Hampshire Railroad, backed by the Central Vermont. Gregory Smith, President of the latter road, is advocating the former.

MERIDEN, CONN.—Surveys for the Waterbury Meriden Railroad are progressing and work will soon begin on the line. Joseph Hugh Crawford is Chief Engineer, and V. T. Valdez, of Meriden, First Assistant Engineer.

JACKSONVILLE, FLA.—The Jacksonville and Fort George Island Railroad will soon be built. Address Captain Charles Holmes.

SAVANNAH, GEO.—A bill is before the State Legislature incorporating the Savannah, Macon, and Birmingham Railroad.

CHADSVILLE, N. J.—The Cumberland County freeholders have decided to erect a new bridge here.

BURLINGTON, IOWA.—A company with a capital of \$300,000 has been organized at Burlington for the purpose of building a wagon bridge across the Mississippi river.

HARRISBURG, PA.—The Carbon, Schuylkill, and Western Railroad Company, with a capital of \$200,000, and the Clearfield and Allegheny Railroad Company, with a capital of \$3,000,000, were chartered July 12. They are under the same control and are said to be a part of the Baltimore and Ohio and Lehigh Valley scheme to run a line from New York to Pittsburgh. The President of both companies is John J. Summers, of Philadelphia. The directors are, Edwin L. McConoghie, Thomas F. Baltz, W. F. Hixson, William A. Baker, H. C. Lincoln, and E. G. Price, also of Philadelphia. The first road with its branches is 325 miles in length, and will start from a point in the southerly line of Carbon County, and the terminus will be at or near Blairsville, in Indiana County. The other road will be 125 miles in length, and will start near Gazzam station, in Clearfield County, and will extend to Allegheny City.

TOPEKA, KAN.—Incorporated is the Denver, Russell Springs, and South-western Railroad to build several lines of road. D. M. Richardson, of Denver, Col., James Warden, of Frankfort, Ky., J. E. Hilt, of Russell Springs, Kan., are among the directors.

RAILROAD.—The Memphis, Kansas, and Western Railroad is now being surveyed from Cherryvale, Kan., to Neosho, Wis. R. M. Whitman is head of the surveying party.

BAKERSFIELD, CAL.—A street railroad will be built here at once.

SAN DIEGO, CAL.—The Escandido and El Cajon Railroads will be built at once.

JAMESTOWN, DAK.—Surveyors of the Minneapolis and Pacific Railroad are running a survey for the extension of the road from Foreman, Sargeant County, North-west. It will probably cross the Northern Pacific, between Eckleson and Spiritwood. The surveyors are ten miles south of Sanborn at Waza. Work is reported to have commenced on the east end.

FLUSHING, L. I.—The Flushing and College Point Street Railroad Company has obtained its franchise for a street railway from Sandford Avenue and Parsons Avenue to the city line. The road must be in operation by September 30, 1888. Ex-Supervisor Joseph Dykes is president.

ASBURY PARK, N. J.—Incorporated is the Keyport and Manhattan Street Railway Company. The directors are Daniel W. Pugh, John S. Pugh, Frank D. Russell, of New York; George D. Keeler, of Brooklyn; William H. Reed, Thomas K. Brown, John D. Sprowl, Dr. J. Arrowsmith, Charles H. Whitlock, of Keyport, and David A. Bell, of Matawan.

HARTFORD, CONN.—Ex-Speaker James Husted will become President of the Hartford, Pennsylvania, and Western Railroad Company, whose road is destined to form important links with the New York Central, Boston and Albany, Harlem, Pennsylvania, Jersey Central, Lehigh Valley, and other railroads, to be reached by the 270 miles of constructed or laid-out road. The road will be extended to the Poughkeepsie bridge and connect with the great coal roads.

FLORENCE, ALA.—The Memphis and Charleston Railroad will build a bridge over the Tennessee River near here. R. B. Pegram, of Memphis, is general superintendent of the road.

TRENTON, N. J.—The Freeholders of Mercer County have awarded the contract for an iron bridge over the Delaware River to the New Jersey Steel and Iron Company.

KNOXVILLE, TENN.—The City Council has decided to subscribe \$500,000 to the stock of two new railroads to be built to this city. The sum of \$275,000 will go to the Knoxville Southern Railroad to be built in connection with the Marietta and North Georgia Railroad, making an air-line from Knoxville to Atlanta, Ga. The sum of \$225,000 will go to the stock of the Powell's Valley Railroad to be built from Knoxville to Cumberland Gap and to connect with the Louisville and Nashville and Norfolk and Western Railroads in Kentucky.

FORT PLAIN, N. Y.—The Fort Plain and Richfield Springs Railroad Company has been incorporated. The road is to be constructed from Fort Plain in a south-westerly direction to Richfield Springs, distance thirty miles. The directors are: William Clark, Charles S. Tanner, Willis F. Diefendorf, Charles Zeilly, John D. Wendell, David E. Dunn, David G. Hackney, Fort Plain; Abram Tilyou, L. G. Youngs, Van Hornesville; S. H. Elsworth, Starkville; T. K. Proctor, Elias B. Wetherbee, Richfield Springs; Stephen Stewart, Springfield Centre.

LITTLE ROCK, ARK.—Articles of association have been filed by the Little Rock and State Line Railroad Company for a road to be built from Little Rock to a dividing line between Arkansas and the Indian Territory. The road will pass through the counties of Pulaski, Saline, Garland, Montgomery and Polk. The incorporators are: John D. Adams, S. B. Adams, J. F. Boyle, J. R. Miller, of Little Rock; E. W. Rector, and J. M. Keller, of Hot Springs.

SAN FRANCISCO, CAL.—Articles of incorporation of the new road through Capay Valley have been signed by the Directors who will be as follows: C. F. Crocker, W. V. Huntington, N. S. Smith, T. Hopkins, F. S. Douthy, and E. H. Miller. This road is to run from Madison, Yolo County, to Rumsey's at the head of Cache Creek.

ST. PAUL.—The contract for building the initial line of the new electric motor to South Park, a new suburb, has been let to Mr. Laurence, Room 61, German-American Bank Building, St. Paul.

MINNEAPOLIS, MINN.—Incorporated is the Mississippi, Faribault and Northwestern Railroad Company, to operate a road from some point in the southeastern part of Minnesota, on the Mississippi river, northwestwardly via Faribault to some point on the western boundary of the State, intersecting the St. Paul, Minneapolis and Manitoba Railroad at or near Willmar, with such branches as the board of directors may consider necessary. Principal place of business, Faribault. Incorporators: Hudson Wilson, S. L. Crocker, T. B. Clement, G. W. Batchelder, A. J. Mennell, M. J. Sheeran, F. W. Friuk, C. C. Perkins, George A. Weston, A. E. Haven, George Tietson, J. C. N. Cottrell, W. E. Blodgett, E. N. Leavens, John Hutchinson, F. A. Bean, J. R. Parrshall, George Robinson, E. H. Lovhed, D. Cavanaugh, T. J. McCarthy, A. W. McKinstry, E. M. Leach, G. W. Wood, F. A. Theopold, all of Faribault.

RAILROAD.—The Minnesota and Northwestern Road has three surveying parties in the field between Duluth and St. Paul locating lines, and their work is pushed as rapidly as possible. The work on the surveys is expected to be completed early in the fall, and the route of the road selected at once and contracts immediately let for the heaviest grading and piling, and the work carried on through the winter.

NASHVILLE.—The contract for the Dunlap Railroad extension extends from the Thomas mines in Sequache Valley to Dunlap, 18 miles, and is a continuation of work already completed from Victoria to Thomas mines, 4 miles, since February 1. There is in progress the construction of 7 miles of heavy mountain work extending the Sparta Branch from Sparta, Tenn., to the Bon Air coal fields at the top of Cumberland mountain. This work commenced February 1, and will be completed in October. All the above work, amounting to about 30 miles, is under contracts awarded to Foster, Creighton & Co., by the Nashville, Chattanooga and St. Louis Railway Company.

TAUNTON, MASS.—The City Government will build an iron bridge over the river at the pumping station.

TOLEDO, O.—Incorporated is the Toledo, Saginaw and Mackinaw Railroad Company: A. W. Wright, of Alma, Mich.; J. M. Ashley, Jr., of Toledo, and others.

BURLINGTON, IOWA.—Incorporated is the Calliope, Burlington and Northern Railroad Company, of Calliope.

DECATUR, ALA.—Incorporated is the Decatur Street Railway Company: W. D. Washburn, A. J. Blether, R. B. Langdon, and others.

DETROIT, MICH.—The Aldermen have authorized the making of a contract with the Detroit Bridge and Iron Works for the Presque Isle Bridge at \$280,000.

BIDS OPENED.

ROCHESTER, N. Y.—The following bids for the fireproof building for the female department of the New York State Industrial School of Rochester, N. Y., were received by D. W. Powers, chairman, and opened by the Board of Managers July 9: C. W. Voshall, Rochester, \$113,089; W. H. Gorshine, Rochester, \$112,000; H. H. Edgerton, Rochester, \$111,487; R. G. Boyd, Rochester, \$110,995; A. Frederick & Sons, Rochester, \$110,853; A. Pappert, Rochester, \$110,500; Ellsworth & Grant, Rochester, \$109,000; Kraft & Siebert, Rochester, \$107,500. The contract was awarded to Kraft & Siebert.

BROOKLYN.—The Supervisors on July 7 opened bids for paving, at the Hall of Records, as follows: P. J. Carlin, furnishing bluestone flagging, \$18,000; granolithic pavement, \$15,600; E. & F. Conklin, \$19,600; H. D. Southard, furnishing bluestone flagging, \$14,749; with granolithic pavement, \$13,197. The bids were referred to the Contracts Committee.

BROOKLYN.—Baker, Smith & Co. have been awarded the contract for steam-heating apparatus in the Court House at \$20,950.

BUFFALO, N. Y.—The Water Commissioners received bids, July 8, for furnishing a 20,000,000-gallon Gaskill pumping-engine, as follows:

With 6 boilers, Holly Manufacturing Company, of Lockport, N. Y., \$99,750.
With 4 boilers, \$94,750.

ST. PAUL.—The City Council has awarded the contract for the up-town bridge to the Keystone Bridge Company, of Chicago, for \$340,324. The bids were:

Edge Moor Iron Company, specification A, \$176,400; B, \$363,400.
M. Lasey, St. Paul, \$135,000.
Keystone Bridge Company, Chicago, \$340,324.
Morse Bridge Company, Youngstown, O., specification A, \$311,000; B, \$324,000.

ST. PAUL.—The Court-House Commission has awarded contract for plastering the new Court House to James Cullen—\$23,549 for lime work and \$26,049 for stucco. The following additional bids were received on carpentering work: Matthias Breen, \$163,357; Johnson Brothers & Loomis, \$179,000, \$143,700, and \$115,647, according to varying grades of work; A. Bassford, \$124,634.40; Bohm Manufacturing Company, \$127,716.65; Corlies, Chapman & Drake, \$134,000; hardware work, F. G. Draper, \$5,000.

BOSTON.—The Court House Commissioners opened proposals for completing the brick, masonry, stone and iron setting of the northerly section of the new court house. The bids were as follows: Sampson, Clark & Co., \$135,270; Whidden, Hill & Co., \$111,748. The contract was awarded to the lowest bidder.

BOSTON.—Bids were received July 8 for building an iron pier at Marine Park, as follows:
Boynton Brothers, Boston, for 26 cast-iron piers, \$42.60 per foot; for 12 spans, \$34,800; for 10 additional pier-piles, \$42.60 per foot; for 5 additional spans, \$14,000.
William G. Coolidge & Co., Chicago, \$38.75, \$39,200, \$38.75, \$26,750, respectively.

Builders' Iron Foundry, Providence, R. I.: \$37.50, \$37,700, \$37.50, \$15,090 (awarded the contract).

BLOCK ISLAND, R. I.—The following bids for cutting a channel from Salt Pond to the Ocean were received by H. S. Millikin for and in behalf of the Town Council July 5: S. V. R. Hendricks, East Hampton, Mass., \$9,740; J. A. Dailey & Son, Providence, R. I., \$9,350. Contract awarded to J. A. Dailey & Son, Providence, R. I., for \$9,350.

NEW YORK CITY.—Bids were opened at the Department of Docks, on July 13, for dredging at Pier 59, North River. The following were the bidders: Union Dredging Company, 20 cents per cubic yard; Charles Du Bois, 23.9 cents per cubic yard.

ST. PAUL, MINN.—The following contracts were reported at the last meeting of the Board of Education for 1887, for school buildings:
Jefferson, \$32,487; Madison, \$14,274; Lincoln, \$10,851; Cleveland, \$21,914; Gorman, \$17,722; Van Buren, \$30,211; St. Anthony Park, \$20,600; Maralester, \$20,900; Mississippi Street, \$32,800; Hamline, \$26,346; Comoville, \$32,570; Jackson School, \$4,519.

The following series of bids with different specifications on the erection of the high school addition were received:

BIDDERS.	1.	2.	3.
J. C. Lillis.....	\$37,300	\$36,100	\$34,030
W. O. Erickson.....	36,000	34,723	34,592
Rundle & Kug.....	36,500	35,500	34,505
F. La Berg.....	36,300	34,075	33,250

The contract was awarded to W. O. Erickson, at \$36,000.

ALBANY, N. Y.—Contracts for dredging were awarded July 11, by State Superintendent Shanahan, as follows: Improvements at Oak Orchard Creek and Tonawanda feeder (\$25,000 appropriated): George M. Taylor, \$22,400; Willard Johnson, \$30,500. Dredging Parada Hook: Charles Brown, Mohawk, 10¢ cents per cubic yard; E. M. Payn, Albany, 15¢; P. W. Myers, Albany, 16¢. Dredging at Bogart light: Charles Brown, 21¢; E. M. Payn, 17¢; P. W. Myers, 17¢. Dredging at Stuyvesant: Charles Brown, 9¢; P. W. Myers, 6¢.

GREEN ISLAND, N. Y.—John McGowan & Co., of this place, are the lowest bidders on sewers, at \$3,000.

ALLEGHENY, PA.—The following bids for boiler, tanks, and sewer castings, were received by the city of Allegheny, July 7 and 11:

For boiler, D. W. C. Carroll & Co., Pittsburg, Pa., \$755 (awarded contract); Thompson, Porter & Co., Allegheny, \$1,225; R. Monroe & Co., Pittsburg, \$845. For two tanks, D. W. C. Carroll & Co., Pittsburg, \$4,567; Thompson, Porter & Co., Allegheny, \$5,900; Ritter & Connelly, Pittsburg, \$4,550 (awarded contract).

Sewer castings, Thomas Carlin's Sons, Allegheny, \$1.75 per hundred pounds (awarded contract).
Union Foundry and Machine Co., Allegheny, \$1.97 per hundred pounds.

STILLWATER, MINN.—Shabel & Currie have been awarded contract for new fire engine-house, \$9,780.

JAMESTOWN, DAK.—At a late meeting of the city council bids for laying water-mains were opened. Eight-inch Kalamain pipe will be used. The bid of Matt Hockers was accepted. He is to lay 2,500 feet of mains with all furnishings for \$4,360. Work must be completed within ninety days of date of contract.

NORWALK, CONN.—Charles N. Wood, engineer, opened bids July 2 for construction of Sub Division 1 of the General Sewerage System, as follows:
Thomas Newman, Brooklyn, N. Y., \$45,200; Luther W. Burt, Hartford, Ct., \$45,019.85; John Bogart & Co., Brooklyn, N. Y., \$44,111.91; A. Bragos & Sons, Middleton, Conn., \$38,374.38; William E. Dean, New York City, \$37,657.83; Francis Leonard, Norwalk, \$34,547.50; Geo. W. Cram, Norwalk, \$33,608.10; James Campbell, Hartford, \$38,901.14; Delos E. Culver, New York, \$37,821.29.

The contract was awarded to Mr. Cram, whose bid in detail was as follows:

For the 66-inch brick sewer, \$12 per running foot; 60-inch brick, \$7.50; 48-inch brick, \$6.50; 42-inch brick, \$6.50; 24-inch brick, \$2.75; 24-inch stoneware pipe, \$2.25 per foot; 18-inch, \$1.35; 15-inch, \$1.15; 12-inch, 80 cents; 20 cents for each 6-inch stoneware or cement house connection in brick sewer; \$1.49 for each 6-inch house connection in either stoneware or cement-pipe sewer; \$5 for each man-hole, complete, with iron head and cover; \$45 for each street basin, with iron cover; 25 cents per foot for catch-basin connections; 40 cents per foot for 10-inch catch-basin connections; \$4 per cubic yard for rock excavations. The quantities were about as follows: Brick sewer, about 300 lineal feet of 66 inches in diameter; about 740 lineal feet of 60 inches in diameter; about 930 lineal feet of 42 inches in diameter; also a Portland cement-pipe sewer, or vitrified pipe-sewer, about 3,350 lineal feet of 12 inches in diameter; about 2,334 lineal feet of 12 inches in diameter; about 725 lineal feet of 18 inches in diameter; about 790 lineal feet of 24 inches in diameter.

FULTON, N. Y.—At the Upper Dam on the east side, Weeks & Redhead have contracted with William Patrick to build a stone flume, with bulkhead, costing some \$20,000.

GOVERNMENT WORK.

The following bids for dredging at Toledo Harbor, Ohio (\$46,000 cub. yds. more or less), were received by Major L. Cooper Osneiman, U. S. A., July 7:

French & Rooney, Toledo, O.; 15c. per cubic yard; all the dredging required.

George Talbot, Buffalo, N. Y.; 16c.; all the dredging required.

George Kellogg, Fulton, N. Y.; 12c.; 423,000 cubic yards.

Stang & Gillmore, Loraine, O.; 21c.; 146,000 cubic yards.

Dodge & Petrie, Chicago, Ill.; 24c.; 141,000 cubic yards.

William & J. W. St. John, Toledo, O.; 16½c.; 141,000 cubic yards.

S. P. & J. A. Smith, Cleveland, O.; all the dredging required.

MONTGOMERY, ALA.—The following bids for a snagboat and machinery were received by Captain R. L. Hoxie, U. S. Engineers, July 6:

M. A. Sweeney & Bro., Jeffersonville, Ind., \$8,400, commencing thirty days after notice of award of contract; completing on or before November 15, 1887; delivered at mouth of Altamaha River, Georgia.

William L. Campbell, Mobile, Ala., \$9,345, commencing thirty days after notice of award of contract; completing on or before December 15, 1887; delivered at mouth of Altamaha River, Georgia.

WASHINGTON, D. C.—Proposals for laying the foundation and furnishing materials for the Library Building were opened July 9, as follows:

For cubic yard, Portland cement—H. L. Cranford, \$5.87; William F. Wheatly, \$5.85; Thomas H. Lyons, \$6.50; J. H. Steeps, \$6.39. American cement—William F. Wheatly, \$3.22, and F. Baldwin, \$4.75. For the whole work, with Portland cement—Jacob H. Dewees, \$107,700; Albert Gleason, \$97,000; E. E. Barnes, \$69,990; H. J. McLaughlin, \$97,500. With American cement, H. J. McLaughlin, \$74,000.

NORFOLK, VA.—The following bid for dredging North River Bar, N. C., were received by Captain F. A. Hinman, Corps of Engineers, U. S. A., July 11: Atlas Dredging Co., Wilmington, Del., 25 cents per cubic yard.

SYNOPSIS of bids for tie-rods for Custom House at Chicago, Ill., opened July 13 by the Supervising Architect of the Treasury Department: Holingsworth & Coughlin, Chicago, Ill., \$22,080; Joseph Downey, Chicago, Ill., \$24,585; William Manson, Chicago, Ill., \$25,735; E. E. Gobel, Chicago, Ill., \$23,550.

MISCELLANEOUS.

LEVEE WORK PROPOSED.—Allotments of work by the Mississippi River Commission, to be approved by the Secretary of War, are as follows:

\$75,000 has been put aside for the levees of the White River basin.

To complete the line of levees that affect the Tensas basin will require approximately about 2,043,333 cubic yards of earthwork, distributed about as follows:

Amos Bayou Ridge to Arkansas City.....	685,733
Duffin levee.....	275,000
Enlargement of levee from Duffin to Boggy Bayou.....	60,000
Boggy Bayou to Panther Forest.....	99,500
Panther Forest crevasse.....	271,600
Linwood to Columbia.....	137,000
Whisky Chute.....	180,000
Brooks Break.....	9,000
Matthews' Bend.....	87,000
Matthews' Bend to Louisiana line.....	238,500

Total.....2,043,333

Fifth Louisiana Levee District (East Carroll):	
Bunche's Bend.....	6,000
All Right.....	35,000
Elton.....	44,000
Lake Providence.....	29,000
Illawara.....	244,000
Madison Parish:	
Ried levee.....	217,000
Diamond Island Bend.....	17,000
Tensas Parish:	
Buck Ridge.....	53,500
Kempe.....	500,000
Concordia Parish:	
Monona to Gross Mear.....	35,000
Lake Concordia.....	150,000
Mono.....	30,000
Deer Park.....	57,000
Roseland.....	58,500

Total.....1,969,000

LOUISVILLE, KY.—A scheme is on foot to establish a comprehensive park system. An organization called the "Association of Louisville" are interested in the project. Municipal officers are also interested.

IRON PIER.—The Riparian Commissioners of New Jersey have given permission to the Gloucester Iron Works to construct in front of their property, just above the Newton Creek, near Gloucester, a large pier. It is to be 600 feet long and 150 feet wide.

Building Intelligence.

We solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

ABBREVIATIONS.—b s, brown stone; br, brick; br st, brick store; b s d, brown-stone dwelling; apart house, apart-house; ten, tenement; c, each; o, owner; a, architect; b, builder; fr, frame.

AMONG THE ARCHITECTS.

We report the following from the offices of New York architects:

Newport, R. I.—Mr. John O'Brien and Mr. William H. Osgood, of New York City, will each erect a residence at this place, the cost of which will be \$50,000. Messrs. Harding & Dinkleberg are the architects.

St. Augustine, Fla.—Renwick, Aspinwall & Russell are to prepare plans for the rebuilding of the cathedral at this place. A large expenditure will be made.

New York City.—Mr. Andrew Kelly will build a five-story apartment house at 183 and 185 Mott Street. Plans by A. B. Ogden & Son; cost, \$35,000.

Greene, N. Y.—Architects Henry M. Ogden & Son have prepared plans for a new church edifice for the congregation of Zion Protestant Episcopal Church, to be erected here; cost, \$45,000.

NEW YORK CITY.

18 Oliver st., 5-story and basement br ten and stores; cost \$18,000; o, William Morris; a, F Ebel ng.

309 and 311 3d av, br tenement; cost, \$50,000; o, J G Wallace and W J Smith; a, O Wirtz; b, J G Wallace.

84th st, s s, 89 e Av B, 4-story br and at ten; cost, each, \$10,500; o, Louis and John Brandt; a, John Brandt.

9th av, e s, extends from 87th to 88th st, 6-story br ten; cost, corner houses \$30,000 each; others, \$40,000 each; o, C L Guilleaume; a, C P H Gilbert; b, not selected.

7th av, n e cor 118th st, 3 5-story st and br ten; cost, total, \$140,000; o, C H Bliss, Rutland; a, E L Angell.

6th av, n e cor 134th st, 5-story br ten; cost, \$21,000; o, James Parris; a, M V B Ferdon; b, James Norris.

N e cor Av A and 56th st, fr structure; cost, \$35,000; o, George David Curtis; a, David W King.

S e cor 9th av and 76th st, br flat and store; cost, \$25,000; o, Leonard Buckman; a, George M Walgrove.

20 W 13th, br stable; cost, \$15,000; o, Laura F Hearn; a, John B Smith & Son.

530 W 25th, br factory; cost, \$25,000; o, John Graham; a, George B Pelham.

121-125 E 23d, br works; cost, \$12,000; o, Harriet W Smith; a, Edward D Webb.

N e cor 154th st and Elton av, br ten and store; cost, \$10,000; o, Henry Gerken; a, M J Garvin.

N s 145th st, bet 8th and New av, q br ten and store; cost, \$174,500, all; o, Francis J Schnugg; a, Herter Bros.

N e cor 10th av and 80th st, br ten and store; cost, \$28,000; o, John P Thornton; a, F T Camp.

E s 10th av, 27 n 80th st, 3 br ten and store; cost \$54,000, all; o and a, as above.

N s 80th st, 80 e 10th av, flat, cost, \$18,000; o and a, as above.

ALTERATIONS—NEW YORK.

124th st, s s, 250 e 1st av, rear of lot, cost \$15,000; o, Abraham Steers; a, Fred Kehoe; b, C R Kehoe.

200 and 202 W 38th st, to be connected; cost, \$10,000; o, Eliza W White, Litchfield, Conn; a, W W Smith; b, J J Tucker; c, J C Hoes's Sons.

225 William st, br factory; cost, \$12,000; o, Mrs. E Heppenheimer; a, Weber & Drosser.

46 W 28th st, br flat and store; cost, \$15,000; o, E J Donnell; a, Keister Wallis.

BROOKLYN.

9th st, s s, 195 w 5th av, 8 4-story b s stores and ten; cost, each, \$12,000; o, S B Oulton; a, W H Wirth; b, not selected.

Kosciusko st, s s, 100 e Lewis av, 13 2-story and basement br dwell; cost, \$4,000; o, a and b, Joel E. Skidmore.

Evergreen av, w s 75 n De Kalb av, 2-story fr ten; cost, \$5,300; o, Ph. Henry Schoenig; a, H Schoeffler; b, Ioeser & Schneider, and J Dreher.

De Kalb av, n w cor Evergreen av, 4-story fr store and tenement, 25x60, tin roof; cost, \$8,800; o, &c., same as last.

E s Jackson av, 90 feet n of Prospect av, 3 fr dwells; cost, \$9,750, all; o, Ralph Kirkman; a, Wm H Wirth.

S s Montague st, 104 ft e of Montague terrace, 1 br flat; cost, \$125,000; o, C D Burwell; a, Montrose W Morris.

MISCELLANEOUS.

BELLEFONTAINE, O.—M. E. church here. Address Alfred Butler.

SPRINGFIELD, ILL.—Two 3-story bldgs; o, Milton Hay; b, J T Rhodes.

MEMPHIS, TENN.—It is proposed to build a \$300,000 court-house.

POTSDAM, N. Y.—2 stores, sand stone fronts; cost, \$10,000; o, James A Cox; a, J P Johnston, Ogdensburg, N. Y.

KANSAS CITY, MO.—Wyandotte, near 9th, 7-story bldg and office; cost, \$150,000; o, D T Beal & C L Dobson; a, Van Brunt and Howe.

N e cor 16th and Bell, 3-story store; cost, \$15,000; o, W P Herring.

12th st and Bellfontaine av, 2-story fr dwell; cost \$19,200; o, Wilson & Graham.

Drepp st, 2-story fr dwell; cost, \$7,500; o, M H Cohen.

S e cor 12th and Charlotte, engine house; cost, \$45,000; o, Metropolitan Street R Co.

14th and Holmes, parsonage; cost, \$8,000; o, Lutheran Church.

S w cor Cherry and 14th, church, cost, \$34,000; o, Lutheran Church.

Ord st near Elma, 4 br dwells; cost, \$10,000; o, Flovd & Emery.

1

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 8. } PUBLISHED EVERY SATURDAY.

NEW YORK, JULY 23, 1887.

LONDON, AUGUST 5, 1887.

SINGLE COPIES, TEN CENTS.
Subscription, \$4.00 per year in advance, post paid. } IN AMERICA
SINGLE COPIES, SIXPENCE.
Subscription, 20s. per annum in advance, post paid. } IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 94 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 20, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

LEAVES OF ABSENCE FOR MUNICIPAL ENGINEERS.

PROBABLY no man now living has had so large an experience with the varied problems of municipal engineering as the eminent engineer who for many years has been at the head of the Engineering Department of the Local Government Board of Great Britain. Sir Robert Rawlinson's letter, therefore, which will be found elsewhere in this issue, is to be commended to local authorities as a plea for leaves of absence for engineers from a man whose experience attaches weight to his utterances.

Aside from the question of considerate treatment of employees, which so much tends to secure zealous and loyal services, so important in professional positions, the so-called "practical" man, with whom such a consideration frequently does not count for much, should be reminded of the fact that municipal engineers who have had an opportunity to observe and note the experience of others are of direct and positive pecuniary value to the community that employs them. Published reports are not usually filled with a record of mistakes or failures and their causes; these can best be learned through personal inquiry and investigation by trained men. It pays, therefore, to ascertain by the experience of others what to avoid, and this fact should be obvious to even the most obtuse and narrow-minded member of any municipal board.

THE HEATED TERM.

THOSE readers of THE SANITARY ENGINEER AND CONSTRUCTION RECORD who have spent the last two weeks in one of our large cities have some idea of the languor and exhaustion, mental and physical, which a few days of continuous high temperature can produce in those subjected to it. The vibrations of force which come to us from the sun, and which are the source not only of almost all the mechanical power we command in the shape of wind, water, and coal, but also of the force manifested in all vegetable and animal life, become at times too strong and continuous for the delicate machinery which exists in the human body to regulate their effects upon it. The miles of fine tubes in the human skin, with their millions of orifices, and corresponding millions of fine nerve fibres which regulate their action and control the blood-currents which surround them in ceaseless flow, drain the fluids of the body by the evaporation which they produce until one almost feels his blood thickening under the process. And in the great city no small part of the blazing heat of the day is stored up in the masses of brick, and stone, and iron of the houses and streets, which become like a gigantic oven, and slowly radiate it out at night. With the first continuous hot wave of the season comes the great mortality of the year among the infants of the city, and especially among those of the tenement-house population. Upon the results of that week or ten days depends largely whether the death-rate of the city for the year shall be high or low. Then is the time when the weak go to the wall, "when the little fingers that just barely have a hold on the slippery edge of life relax their too feeble grasp," and the ill-fed, badly nourished, overheated children die gasping for pure cool air.

Something is done for their help. The corps of inspectors of the Health Department, lecturing, helping when

but too often too late to do much good. We have the water excursions, and a thousand other channels by which private charity comes to the rescue; but the melancholy confession must be made, that with all the means for help which exist, and with all our increase of knowledge as to the causes of the heavy loss of life in our cities during the heated term, the loss itself still seems largely inevitable.

Those who can escape from the city with their children need no journalistic advice. If the infant falls ill from the heat they will get their orders, short and clear, from the first physician they call in; but those who cannot go, and who are packed in small rooms, supplied with air from foul courts and passageways—what is to be done for them? It is much easier to ask the question than to answer it; in fact, for the lowest class of the tenement-house population we do not believe it can be answered. But it is certain that little can be done by mere temporary expedients or by the use of drugs. If the Tenement-House Act is enforced throughout the year it will have a great effect on the mortality during the heated term, and with this, with the provision of abundant and pure water-supply, the preservation of cleanliness in the streets, and the prevention of the sale of unwholesome food, the powers of the municipality are well nigh exhausted. The time of greatest trial is, fortunately, soon over, and those who survive soon recover. This process of natural selection, resulting in the survival of the strongest, is a sharp remedy, but perhaps it is the only one which will keep the race in existence. Meantime, whatever may be thought of the expediency of official interference, it is certain that private charity finds here one of its best fields for exercise. To give a poor child a chance to have cool fresh air for a week is not much to ask, and there are plenty of ways in which ten dollars can be well invested in this direction in any city, though we are speaking here more especially of New York.

THE DRAINAGE QUESTION IN CHICAGO.

AFTER all the trouble and expense attending the recent examination into the question of the sewage disposal of this great city, there is now a growing feeling that it is best to continue the present methods and to preserve the purity of the water-supply by extending the intake further into the lake.

This looks very much like a begging of the whole question and a simple deferring of the inevitable to a later date.

The idea of taking drinking-water from the same tank into which slops are poured is justly revolting, and this is doing the same thing on a larger scale. Doubtless the danger of contamination is somewhat remote, but it will be an increasing danger as years roll on.

But what are we to say of the willingness thus shown to make the shores of the lake a nuisance? All experience points to this as a certain result. There may be no immediate danger to life and health, but there will certainly be offensive sights and offensive smells. The time is surely coming when every community, large and small, will be required to so dispose of all refuse, of whatever sort, as to cause no offense, danger, no contamination of streams or of shores of masses of water, be the expense

what it may. We shall regret to see the enterprising city of Chicago doing anything which is not fully justified by the best practical science of the age.

NATURAL FILTRATION.

THE paper of G.W. Pearsons, M. Am.Soc. C.E., on "Natural Filtration," which we elsewhere print, treats of a subject which has several times been discussed in our columns. When the author of the paper narrates facts which have come under his own observation, he is interesting, but where he theorizes it is difficult to agree with him; chiefly, we imagine, because his theories are not explained with sufficient clearness. The discussion of the passage of water through the Long Island sands is altogether unintelligible. The statement that a mass of water 200 feet deep is constantly moving toward the sea in the sands of Long Island at an average rate of nine feet a day, the surface water moving at the rate of twenty-

OUR BRITISH CORRESPONDENCE.

Architectural Education—Danger in Connection with a Gas-Supply for Train-Lighting—Generosity on the part of the Mumbles Water-Works Owners.

LONDON, July 6, 1887.

A DISCUSSION on architectural education has been going on in London under the auspices of the Institution of British Architects, almost *pari passu* with that going on in the columns of THE SANITARY ENGINEER and CONSTRUCTION RECORD. The practical outcome of this discussion is the establishment of an atelier for architectural students in London. This is set up under the direction of Mr. F. T. Baggallay, Royal Academy Gold Medallist, and Mr. Walter Millard, Royal Academy Traveling Student and Pugin Student. The special objection to this atelier would seem to be that the directors only make certain visits during the course of the day, the atelier being totally distinct from the business premises of the directors. So long as the said directors are not in possession of a

In connection with the long drought we have been experiencing here, reports come from all parts of the country of shortness of water-supply, and in some places of water famine. The action of Sir John Jenkins and his fellow-owners of the Mumbles Water Works, whose mains reached to within three miles of Swansea, is worthy of record and imitation. Swansea has been in great difficulties from the drought, and Sir John Jenkins wrote to the town clerk to say that this was not the time to seek to make money out of Swansea's difficulties, and offering to supply the town with the Mumbles Water Works' surplus water, free of charge, during the period of the drought.

four feet a day on a slope of five to seven feet in a mile, does not accord with either theory or experiment.

The description given of the method adopted by the author for collecting the ground-water for the supply of Rockaway Beach on Long Island is interesting, and we are pleased to note, what to be sure was only to be expected from a man so practically scientific as the author, that the existence of magical virtues in "driven wells" is not at all conceded by him.

The valuable memoranda given as to the quality of the ground-water in different places show the necessity of calling on both an engineer unbiased by a predilection for any "system," and a chemist, before deciding to use ground-water anywhere for a supply for domestic purposes.

THE American Institute of Mining Engineers met at Salt Lake City July 6. Mr. Thomas Egleston delivered the president's address.

large amount of business, they can, of course, devote proper attention to the matter; but in the event of their receiving a fair share of business, such as one would presume their abilities would command, it is not likely that they will be able to devote a sufficiency of attention to the "school." Further, it is questionable whether the pupils will find sufficient sustained interest to enable them to persist with their work on the presentation of any special difficulties in the absence of their guide, philosopher, and friend, whose duty it would be to make the matter clear to them.

An accident reported from the Berlin and Potsdam Railway illustrates the danger in connection with the gas-supply for train lighting, which should be taken as a warning. The reservoir for gas consisted of a sheet-iron drum. A passing locomotive collided with the drum, bursting same, and causing explosion and fire. There was, fortunately, no damage to life or limb resulting, but it points a moral that such reservoirs should, so far as possible, be placed out of the way of the possibility of such accidents.

OUR VIGNETTE ILLUSTRATION.

THE LAXEY WATER-WHEEL, ISLE OF MAN, ENGLAND.

THE Laxey wheel, illustrated in this issue, is said to be the largest water-wheel in the world. It is used to pump water from the Laxey mines on the Isle of Man, the water being raised two hundred fathoms. The dimensions of the wheel are: diameter, 72 feet 6 inches; breadth, 6 feet. It makes two revolutions per minute. It is an overshot wheel, and said to be so truly set that a deflection of one-eighth of an inch cannot be detected. The water to operate it is brought from the mountains and ascends through the circular pillar.

PHILADELPHIA ELECTRICAL SOCIETY.

THIS society, which was organized recently, has elected officers as follows: President, M. D. Law; Vice-Presidents, John Sager, H. B. Cutter, and C. M. Knapp; Recording Secretary, D. R. Gibbs; Financial Secretary, W. O. Snyder; Treasurer, A. F. Reed. Board of Managers (for one year), F. W. Griffin, W. McDevitt, A. H. Manwarren, A. Ford, D. A. Curl (for six months), W. S. Leigh, Mr. Roberts, and R. J. Park.

E. A. P. NEWCOMB, ARCHITECT.

TUBULAR SUBWAY UNDER NORTHUMBERLAND STRAITS FROM NEW BRUNSWICK TO PRINCE EDWARD ISLAND.

IN 1872, when Prince Edward Island went into the confederation of provinces which form the Dominion of Canada, the Government guaranteed among other things to keep open winter communication with the mainland, and, in 1873, the winter steamer "Northern Light," built specially for ice duty, was put on to do this. She failed to do this properly, and is only capable of crossing with the mails and a very limited number of passengers, and small freight packages may also be crossed at favorable times.

Immense ice-floes from the Gulf of St. Lawrence continually pass back and forth through the Straits with every tide, and, under certain prevailing winds, pile up in a manner impossible to pass through. Several times the "Northern Light" has been carried away by the ice, and once or twice carried upon the rocks and supposed lost for several weeks until released by a breaking up of the floe. The

States by Hayden H. Hall, President of the Submarine Tunnel and Tube Company of New York, and exhibited lately in model at the Provincial Exhibition, in Charlotte-town.

J. G. Jonah, C. E., for the Dominion Government, made a survey of the Straits in September over the proposed route. The bottom was found free from rocks and composed of brick-clay, sand, and gravel.

Figure 1 is a copy from surveys of Mr. Jonah, giving soundings and borings, which vary somewhat, though not

greatly, from the former official surveys. In the profile the vertical scale is twenty times what the horizontal scale is. The soundings are marked in feet from low water, and the distances in miles from Cape Traverse. The borings of the bottom were made at the distances marked 1 to 23, inclusive, and show sand and gravel overlying brick-clay to near the shallow water between Nos. 18 and 19. Then hard gray sand and loose gravel is found. It is at this point that the tube is to come out of the water. The great-

THE CINCINNATI CITY HALL COMPETITION.

JULY 16, at noon, was the time set for the submitting of the plans for the new City Hall, to cost \$600,000. When the time had arrived, it was found that fourteen architects were competing for the prize. Through the kindness of Mr. Robert Mitchell, the large room at the rear on the first floor of the Mitchell Office Building is used for the exhibition of the drawings. The competing architects are: H. E. Siter, S. E. Des Jardins, Schuerman & Kennedy, James W. McLaughlin, and Samuel Hannaford & Sons, of Cincinnati; J. F. Denson, Washington, D. C.; W. M. Walter, Chicago; Johnson & Scobey, Chicago; E. L. Rice, Wilmington, Del.; James Balfour, Hamilton, Ont.; John Schaarschmidt, and F. E. Sulzer, New York; J. W. Yost, Columbus, and two nameless plans. Secretary Allison says that they will receive instructions by mail, no doubt, as to who the nameless parties are.

The bulletin of the Central Society of Architects of Paris contains a report by M. Julien Bayard upon two books by Mr. Glenn Brown, of Washington, the first of which, "On Sanitary Foundations," was first published in THE SANITARY ENGINEER and CONSTRUCTION RECORD, and the second, "On Water-Closets," was first published in the *American Architect*.

M. Bayard reports that both of these works merit translation and publication in one of the French technical architectural journals.

SECTION SHOWING BORINGS ON LINE OF PROPOSED SUB-WAY ACROSS NORTHUMBERLAND STRAITS.

amount of subsidy granted annually by the Dominion Government to this province for ice-boat, summer steamers, and loss on the island railway is about \$200,000.

The object of the submarine tubular railway is therefore to secure to Prince Edward Island what was promised at the first, but without any definite idea as to how it was to be carried out, until, in 1873, Hon. George W. Howlan, a member of the Dominion Senate, and since 1862 a United States consular agent, conceived the plan of an iron tubular subway for a railway-track so that goods could be shipped through at all seasons without change of bulk, and the shortening of time to hours, not days, and increasing the trade with the United States, as there can be no moving of freight during the winter months.

The shortest distance from Prince Edward Island (Carlton Head, Cape Traverse) to the mainland, Cape Tormentine, in New Brunswick, is eight miles. It is proposed to run out on piles two miles from the New Brunswick shore, or to the 6-mile mark, Fig. 1, and then follow the contour of the bed of the Straits, sinking the tunnel in the clay bottom.

The tunnel will be sixteen feet in diameter, built in segments of five segments to the circle, in 10-foot lengths, composed of cast-iron, and lined inside with two feet eight inches of concrete in the bottom and one foot around the circle. It will be laid by a plan recently patented in the United

States. The work is thought a simple and practicable one, and will take about three years to build from the time it is started, and will cost about \$5,000,000. A company has been lately organized for this purpose.

Figures 2 and 3 show the side view and cross section of the sea end.

The work is thought a simple and practicable one, and will take about three years to build from the time it is started, and will cost about \$5,000,000. A company has been lately organized for this purpose.

THE DÉBRIS QUESTION IN AUSTRALIA.

THIS question has been taken up by the Colony of Victoria, and a commission appointed for the purpose has reported to the Minister for Mines, recommending that the inspectors of mines for the colony should be appointed *débris* inspectors, and that every mining company should be required to build impounding dams with such provisions for flood-waters that they shall not sweep any of the tailings or *débris* from hydraulic mining over the dams.

No permission in future should be given for hydraulic mining until proof has been given that sufficient area can be obtained for such impounding reservoirs; the sufficiency of such areas and the plans for dams to be decided on by the *débris* inspectors, and they are to hear and make suggestions for remedying any complaints by landowners who think themselves injured by mining refuse. The Government to maintain the dams after the abandonment of the mine.

The provisions of this report are to be incorporated in a bill which will be submitted to the Legislature.

A NOVEL WAY OF DRAINING A CELLAR.

ST. PETER'S Episcopal Church at North Greenfield is probably the only religious edifice in Wisconsin which depends upon champagne bottles for its drainage. When the church was built funds were very scarce, and many small economies were practiced. The congregation on first occupying their place of worship found that it was uncomfortably damp. The fact was mentioned to the late George Stevens, who said: "I'll tell you how to remedy that. Go into my cellar and you will find enough champagne bottles to build a drain with. They are often used for that purpose in England, and when once laid will last forever, if not allowed to choke up." The bottles were secured, the bottoms deftly knocked off, and the necks abbreviated in length. Then, by placing the neck of one bottle in the bottom of another, and so on, a drain was constructed which has kept the little church "extra dry" ever since.—*Milwaukee Sentinel*.

MR. ANDREW GILES, of San Antonio, Tex., has sued El Paso County for moneys due him for services as architect of the county court-house and jail built two years ago. The county offered some time since to pay him in court-house bonds, which he declined to accept in place of money. The county claims that he modified his plans in collusion with the contractor, after contract had been let, so as to increase the contractor's profits.

THE AMERICAN WATER-WORKS ASSOCIATION IN ANNUAL SESSION.

(By our Special Correspondent.)

MINNEAPOLIS, MINN., July 16, 1887.—Those who have been in attendance upon the seventh annual session of the American Water-Works Association, just held in this city, have not only found the time pleasantly spent, but most profitably. The attendance has been good throughout, and the men who have contributed so signally to the success of the occasion by presence, by paper, and by debate, have been men of national note in this all important department of municipal, sanitary, and economic life. Earnest, thoughtful, practical men are these, wielding immense power. It was 11 o'clock Wednesday morning last when President B. F. Jones, long of beard, pleasant of countenance, affable of speech, called the association to order and read a pungent opening address, in which he dwelt, in a general way, upon the mighty problem of pure water for the future. He cleverly criticised a Denver paper for its attack upon the article by City Engineer Keating, of Nova Scotia, presented at the last session of the association on "Fungus or Mossy Growth in Clear Water." President Jones introduced to the association Mr. Y. Nakajinni, a graduate of the Imperial University of Tokio, Japan, and now visiting America and Europe to practically perfect himself in the department of hydraulic engineering. He was unanimously chosen an honorary member, and, in his response to the courtesy, made merriment by his rather ineffectual but interesting English. Alderman Mills, in the absence of Mayor Ames, formally welcomed the guests, and Supervisor Matthew Walsh, of the City Water-Works Department, added words of welcome and the customary panegyric on the city of Minneapolis. President Jones responded on behalf of the association in an address which was pleasing as well as pointed. In his remarks he said:

"Among our number you can find some amply able to select a source of water-supply; some to tell you the proper kind of machinery and where to get it; some who know all about grate-bars, smoke-stacks, and perfect combustion, while others are supplied with chestnut gongs for the advocate of smoke consumption. Others are experts in the matter of dealing with the public as to rules and regulations in water-waste, motors, etc., etc., while there are still others, doubtless, who could discuss more or less intelligently upon fungi, algæ, bacteria, microbes, organic matter, nitrates and albuminoids and their special adaptability to the human stomach."

Secretary Decker—than whom it were hard to find a secretary more obliging—then read his brief annual report, showing 180 active and 51 associate members. The association spent \$675 during the year and received \$905. Mayor Ames arrived late and made a few general remarks before the adjournment for dinner. In the afternoon Secretary Decker read a paper by A. C. Sekell, on "Ground Water as a Source of Supply," favoring such water if the natural conditions were good. The Secretary also read a paper by H. F. Dunham, of Cleveland, O., on "Private Water Companies," taking a general ground in favor of private corporations where ordinances were properly guarded. Some slight discussion followed in which Mr. Pearsons maintained that ordinances were often granted containing loopholes of advantage to the contractor, and urging that the source of supply should be studied very closely.

President Jones said that it was a more important subject to the people than to the man who got the franchise first, for he generally sold out to some one else. The paper on "Revolution Counters: Is their Record Reliable in Computing Pumpage?" was not given, but a general discussion on the subject was engaged in.

Mr. Gardner, of New Orleans, one of the most animated members of the association, wanted definite information as to the reliability of the counters, and made note of the fact that his engineer had fooled him as to results by tampering with the counters.

Mr. Briggs, of Indiana, who has a pat and oftentimes telling remark upon almost any subject, said that he couldn't imagine why the engineer should do such a thing any more than he would pump water and steal in order to make a better showing for his pumps.

President Jones put his views in a line: "Keep your pumps tight and the counter will be all right."

Mr. J. B. Bassett, of Minneapolis, (not a member of the association), held that if the plunger pump was used the counter would record the pumpage with great accuracy, but it would not if the double-action piston pump was used. Another paper was read by the secretary—"Recording Gauges," by Charles A. Hague—and Mr. Denman in considering it made a plea for more wages for engineers. The following new members were admitted during the day:

R. M. Jones, R. C. Pearsons, Wyandotte, Kan.; H. C. Parrott, Lockport, N. Y.; W. A. Bixby, Galena, Ill.; W. H. Getchell, Faribault, Minn.; C. S. Drummond, Winnipeg; H. S. Van Cleve, Andrew Bergstrom, and F. F. Moody, Minneapolis.

Invitations were extended to the St. Paul and Minneapolis engineer clubs to join in the deliberations of the association.

The day proved to be a busy one indeed and an interesting evening session completed it in fine style. The question-box was the centre of attraction, and so important were the queries that but two were considered in the whole evening. The first was as follows:

"On what basis should water-works property, owned by private corporations, be assessed as compared with the as-

essment of other property, and what should be the assessment of water-mains and hydrants?"

Mr. Beach, of Minneapolis, referred to the taxation of the water-works at Faribault, Minn., which were not taxed on what they were worth standing alone but on what they were worth in connection with a franchise to maintain water-works. In Minneapolis, he understood, the gas-works were assessed by an agreement at the rate of \$10 per ton for their pipe—about what it would bring for old iron. He held that pipe ought not to be taxed in connection with a franchise.

Mr. Donahue, of Davenport, thought the matter should be fixed in the franchises.

Colonel Henion, of Minneapolis, thought it was a question for the courts. The water powers, so far as he could see, could not influence the decision of the courts.

President Jones couldn't see why a city should maintain water-works any more than it should a brewery or any other manufactory.

George H. Chandler, of Kalamazoo, Mich., was a valiant and single-handed combatant for the municipal water-supply system. Others gave fragmentary expression to various ideas. The second question that came out of the box was the one which is a good deal like "Which was the greater patriot, Lincoln or Washington?" for it was: "Are water-works more economically managed by public or private corporations?"

Mr. Gardner maintained that over one-half of the United States was owned by corporations and thought they should own the water-works systems. Mr. Briggs thought it better for the citizens to have the city own the works. President Jones still stuck to his theory that the city should not own water any more than beer. Mr. Gray, of Wisconsin, sounded the political alarm—was afraid politics would creep in where there was city ownership. Mr. Chandler, of Kalamazoo, Mich., believed that a city could build as cheaply as a corporation, and scouted the idea that employees should be changed every time parties did. Mr. Pearsons, of Kansas, favored private ownership. The hour was late and the convention adjourned for the day.

THE SECOND DAY.

It was a little after 10 o'clock when the members came into the Ladies' Ordinary of the West Hotel, where the sessions are being held. The prompt and business-like methods of the association were exemplified again, though the chairman does not attempt to hold a tight parliamentary rein when matters of vital importance are being considered, even a little irregularly. It has been one of the helpful features of this convention that when there have been injected into the programme at unexpected moments special questions for consideration by the association, they have been questions of live, vital, practical interest, not only to the water-works managers, but to the people at large.

The Secretary announced that about fifty letters and telegrams from prominent people had been received, and they were accepted and passed without reading. Mr. G. W. Pearsons read the first paper of the hour, and which proved a most interesting one, on "Natural Filtration."

After the paper, by special request, Mr. Beach reviewed the description of the Denver water-works, given at the last annual session, for the benefit of those who were not present at that meeting in Denver. Mr. Beach referred to the water in the Missouri River, near Pierre, Dak., showing that it rose and fell in exact unison with the water in the water-works well—150 feet from the bank, and in no way connected with the river. The local engineer was present also, and gave, in a plain, blunt, but interesting style, a description of the works. He showed that though the well bottom was twenty feet below the bottom of the river, yet the water rose and fell the same as that in the river, and had, moreover, almost the same chemical properties as the water in the river. The water came forth from its percolation pure and clear.

Mr. Gardner, of New Orleans, said that it was almost impossible for water to percolate through the river bottoms.

Mr. Beach, in some entertaining general remarks, referred to a well dug in a Dakota town, near the Missouri, where the water, when struck, was positively filthy, and had such an intolerable stench that the men could not proceed with the work.

Mr. Briggs, of Indiana, referred to the water in his town (Terre Haute), and, after detailing experiences, said that no water would filter from a river into a well.

Mr. Hodgkins put a practical question to any body who would answer it, wanting to know, first, whether the water in the well adjacent to a river came from the stream or ran into the stream; and, second, if it was a fact that when you dug a well near the river you got river water, what on earth was the good of digging the well when the river was there.

Mr. Briggs said the reason they didn't take it out of the river in many cases was because it was so infernally muddy.

City Engineer Rinker, of Minneapolis, wanted to know if the water in the rivers of Minnesota was not purer and better than when it was percolated. He referred to the fungus growth running in some cases from 100 to 200 feet out into the lakes in this State, and maintained that it was as well to pipe to the rivers as to carry it through a filter to a well.

Mr. Espy showed how water might be filtered by percolation and yet not be eliminated of any mineral substances. He couldn't see the good of the filtering.

Mr. Denham described somewhat in detail the gallery system, if such it may be called, at Des Moines, Ia., and showed how they had obtained pure water after much difficulty. They were pumping from 1,000 feet away as high as 5,000,000 gallons a day, yet it hadn't begun to exhaust their supply. He recommended very highly the ninth annual report of the Massachusetts Board of Health, prepared by Geo. H. Nichols. Mr. Gardner read a paper by J. D. Cook, of Toledo, O., on "Filtration or Subsidence," and then one by himself on "Classification and Purification." Mr. Denman read a long paper by W. C. Conant, of New York City, bearing on the advisability of copying after nature. The association then adjourned for the forenoon.

The afternoon was warm and sultry and the delegates dropped in slowly. The Secretary read a paper by S. McElroy on "Fungus or Mossy Growths," or rather started to read it, and after wading through ten pages, the association decided that he might print the fifteen unread with the first ten and they would listen to something else. The paper on "Elevator Indicators," by J. N. Tubbs, was not presented. "Reservoirs, Open or Closed," was the subject of the paper by G. E. Beach, of Minneapolis, and it proved one of the most interesting ones the convention had yet listened to. At its conclusion Mr. Beach read an exhaustive and very long paper on the legal aspect of water, taking the general ground that water was a commodity, and water rates were not taxes, though property could be sold to satisfy the demands of these rates the same as for taxes. He wanted them to understand that they could not stop water to compel a man to pay a debt which was owing for something else than water, nor could a water company shut off a subsequent tenant because a preceding tenant had failed to pay. He held that a tenant could not keep a hydrant in his yard and say to the water-works company he was not using it; he must cut it off entirely or pay rates. At 4:30 o'clock the carriages which were in waiting conveyed the members of the association to Minnehaha Falls, and they passed a pleasant hour on the trip.

THE THIRD DAY.

In the morning the members of the association were driven about the city in carriages and visited various points of interest. The last regular session was then held and was largely devoted to routine business of only immediate interest. One paper, however, was read by Mr. Denman, of Des Moines, prepared by himself, which was in a certain sense supplemental to the long treatise given by him the day previous. He held among other things: That percolating waters found in wells, or oozing through the soil, or standing upon the surface belong as absolutely to the owner as the land itself; that water-courses are common in the sense that property rights do not actually exist in them, and that after a person has appropriated water taken from a common source it cannot be taken from him without violation of law. Water in pipes, the speaker held, was personal property. A water-works plant no more makes the water distributed really than does mill machinery make flour really.

It was decided to print this paper of Mr. Denman and his treatise on the legal points in pamphlet form. A committee was appointed to prepare suitable eulogies on deceased members. The regular papers all being exhausted it was decided in order to select the place for the next annual meeting. Various members named the good points of Detroit, Baltimore, Washington, Pittsburg, and Cleveland. The latter place was chosen, and April 13, 1888, selected as the date. Resolutions were adopted thanking Colonel Henion, of Minneapolis, and his associates on the Committee of Arrangements and expressing the customary stereotyped but sincere thanks. The nominees of the committee appointed to name officers for the ensuing year were unanimously chosen and are as follows:

President, Col. J. T. Fanning, of Minneapolis; Vice-Presidents, J. M. Diven, Elmira, N. Y.; N. J. Milner, Birmingham, Ala.; Col. J. W. Henion, Minneapolis; J. P. Donahue, Davenport, Iowa; H. W. Ayers, Hartford, Conn.

Finance Committee: A. N. Denman, Des Moines; B. M. Espy, Wilkesbarre, Pa.; C. N. Priddy, Leadville, Col.

Secretary and Treasurer: J. H. Decker, Hannibal, Mo.

The question came up as to whether associate members should be allowed at future meetings to exhibit their samples, and considerable discussion ensued. It was finally decided to invite them to be present at future sessions and explain their wares in a room outside the convention hall. The regular sessions then closed. In the afternoon St. Paul was visited and a carriage drive enjoyed about the city, the day closing with an informal banquet at the Hotel Ryan. This (Saturday) morning the members of the association are being driven about Minneapolis; this afternoon they are to go to Lake Minnetonka as the guests of the Minneapolis and St. Paul Water Boards, and this evening there is to be a banquet at Lake Minnetonka.

The following were among those in attendance the first day:

H. W. Ayers, Hartford, Conn.; G. E. Beach, Minneapolis; William Bowen, Oskaloosa, Iowa; Dexter Brackett, Boston; C. S. Brown, New York; Philip Buchner, St. Paul; G. A. Chandler, Kalamazoo, Mich.; J. H. Decker, Hannibal, Mo.; A. N. Denman, Des Moines, Iowa; J. M. Diven, Elmira, N. Y.; J. P. Donahue, Davenport, Iowa; B. M. Espy, Wilkesbarre, Pa.; J. T. Fanning,

Manchester, N. H.; L. H. Gardner New Orleans; A. H. Harrison, Stillwater; J. W. Henion, Minneapolis; Charles Hood, Burlington, Iowa; B. F. Jones, Kansas City; I. L. Lyman, Lincoln, Neb.; J. A. Mills, St. Catherine, Ont.; W. J. Milner, Birmingham, Ala.; William Molis, Muscatine, Iowa; G. W. Pearsons, Kansas City; C. N. Priddy, Leadville, Col.; W. G. Richards, Atlanta, Geo.; A. Rinker, Minneapolis; William Ryle, Paterson, N. J.; Matt Walsh, Minneapolis; R. D. Wirt, Independence, Mo. Also the following associate members: Bingham & Taylor, Buffalo; R. Beaumont; Chapman Valve Company, Indian Orchard, Mass.; J. B. Clow & Sons, Chicago; W. H. Marsh, New York; A. W. Morgan, Buffalo; National Meter Company, New York; National Tube Works, McKeesport, Pa.; Union Water Meter Company, Worcester, Mass.; R. D. Wood & Co., Philadelphia; H. R. Worthington, New York; W. H. Willard, Eau Claire, Wis.; Charles F. Loweth, St. Paul; John Wetter, East Saginaw, Mich.; H. E. Keeler, Chicago, Ill.

NATURAL FILTRATION.*

Question.—Is it practicable, as a rule, to depend upon a water-supply drawn from the gravel or sand under or adjacent to a stream?

The title of the subject allotted to me, and the question, seem to cover both quantity and quality.

The writer is very much inclined to generalize, perhaps too much so, but this question does not admit of a general answer. It would be very pleasant if an affirmative answer could be given, but, unfortunately, the most general one would be in the negative, and those favorable localities where such a supply can be obtained cannot be ignored.

The compass of this paper includes only such supplies as may be drawn from streams by the use of the natural ground as a filtering medium, but it is difficult to say just how far from a visible stream we may go, or whether those supplies which are drawn from invisible accumulations of water in areas of sand or gravel should not be included; they are a factor of as great value as the first, and as the means of obtaining a supply from them is similar, it seems proper to draw no line between them. The most important supply now drawn from underground in this manner is probably the auxiliary supply of Brooklyn, L. I. When this is examined it will be found to be only reaching for more of the same supply the city had before.

Ordinary sand or gravel of somewhat uniform character has interstices to the amount of thirty per cent. or more of its volume; compacted by the wash of the sea, the smaller particles naturally filling the voids between the larger, and further condensed by centuries of pressure from the superincumbent mass, it is doubtful if the voids exceed in the aggregate fifteen or twenty per cent.

On the sea beach of Long Island the writer has observed the water of a heavy storm sinking into the sand as fast as it fell; further inland, the surface-soil and vegetation retards the descent of the rainfall considerably, still a very large per cent. passes into the ground. The mean annual rainfall of this locality is some forty-two inches, of which it is probable that considerably more than fifty per cent. sinks, say twenty-four inches per annum, or enough to fill the voids in the water-bearing stratum to a depth of ten feet or more.

This moves on a gradient of from five to seven feet per mile, steadily seaward, enough passing off each year to make room for the yearly accretion.

Neglecting the study of its passage in detail, consider that a mass some 200 feet in depth takes on this motion. How much greater the movement is at the top we do not know, but as water moves in the line of least resistance, we may naturally consider that the greatest movement is near the surface. The average would be some 3,000 feet per year, or say nine feet per day.

At the wells, Professor Trowbridge found† the movement about one foot per hour. The same study shows that over 200 millions of gallons can be drawn annually from each square mile of such ground. This speed of flow of one foot per hour, given as the equivalent of a head or slope of from five to seven feet per mile, seems to be the movement of the contained water; that is, a movement of about two and one-half gallons through each square foot of the area traversed. This accords reasonably well with the former analysis, and is the writer's understanding of Professor Trowbridge's paper.

In artificial filtration we reach a maximum of some five times this amount; that is, a cubic foot of water per hour per square foot, with a clean filter, but soon decreasing to perhaps half this. It is evident that clean material will allow a much greater rate of motion through it than when it has become partially clogged; it is also evident that the motion of the water must be so slow that the suspended particles of impurity may be at liberty to attach themselves to any solid substance with which they come in contact on their journey, and not be again displaced by the action of the moving current.

The action of coagulants, alum, iron, muriatic acid, etc., seems to add very much to the rate of motion available for filtration, as would be naturally inferred, the aggregation of particles in this case making them much readier to seize and hold to any solid substances with which they come in contact. I think that Colonel L. H. Gardner, of New Orleans, was the first to suggest this as a practical aid to rapid filtration. I make the statement from my own understanding of the matter. Brother Gardner can deny the charge if he chooses, but otherwise I think we must hold him responsible; be this as it may,

it would seem that some of the principal builders of filters have been enabled by this simple addition to the ordinary process of filtration to add very largely to the efficiency of their filters.

The writer would here note that the experiments of Colonel Henry Flad, of St. Louis, and his own, show that when the action of filtration is upward instead of downward, a large body of still water being below the filter, the action of gravity on the particles rejected by the filter tends to deposit them in the still water, and the filter is much more effective and permanent than with the usual downward flow. It may be objected that the writer is wandering from his subject, but it is probable that the other writers on corresponding subjects will likewise wander from theirs, they having so much in common.

If we agree on any point it helps to establish that point; if we disagree, the meeting can note points of difference and make their own decisions, so that it cannot be considered as lost effort if we do to some extent trench on each other's subjects.

Under or on the banks of streams galleries have been built with a view to obtaining natural filtration; where the current is at times so strong as to wash from the bed of the stream the silt which has been deposited by a lower stage of water, the action of these galleries is similar to that of an artificial filter; where the surface of the sand or gravel is covered with a less pervious material, which remains *in situ*, it may be doubted whether the most of the supply comes from the stream.

Bear in mind, that all ground-water is primarily derived from rainfall; that in every case the stream is the natural drainage of the area traversed; that all ground-water tends in this direction; and it is evident that the rainfall on this ground, passing underground to the stream, is a greater or less factor of the supply. In the Northern States, water-bearing gravel-beds are found which may be very valuable as sources of supply.

At Peoria, Ill., a small well near the river was sunk through hard clay into a stratum of coarse gravel and boulders of unknown depth or extent. This yielded some three millions of gallons per day, and the amount available seems unlimited. So far as the writer is aware, the quality is good for city supply, but I have not heard of its having been utilized for this purpose.

In Allegheny County, New York, the Genesee River passes through a similar formation. At Binghamton, New York, water is drawn from a similar source. In Kansas, an immense deposit of sand and gravel seems to exist over a large area between the Platte and Kansas Rivers; the Kansas lying in lower ground draws a large portion of its waters from this source.

It would seem probable that these deposits occupy the channels of former rivers, and that we may find them away from as well as adjacent to streams, or some of them may be deposits of supposed glacial drifts like that of Long Island; in any case, when we find such a deposit it is worth testing if we are after a supply, but it is only by testing that either its quantity or quality can be known.

At Marshall, Mo., the writer found a water-bearing sand deposit some twenty feet in depth; its apparent breadth was something less than a mile, its length unknown. At a depth of thirty feet bits of wood, bone, coal, etc., showed very clearly that its origin was comparatively recent, but evidently prior to the present make-up of the country.

About a quarter of a mile below this well there was a living spring where the sand stratum cropped out in the ravine; during the sinking of the well, the pumping necessary for the work dried the spring, showing that the flow of water past us was arrested by the depletion.

The well was thirty-six feet in diameter and about the same in depth, the object of this size being to store water for sudden call. It seems able to supply permanently some 200,000 gallons of water per day.

The sides of the well for ten feet from the bottom are made of cants of 3-inch plank, kept one-eighth of an inch apart by veneers of wood, giving about 1,000 square feet of percolating area. During the sinking, however, all the water came from the bottom. The well was accordingly stopped three feet above the hard-pan bottom, and the sand and gravel covered with stone through which the water might find its way to the well. This is mentioned from the fact that it corresponds with the usual practice in filtering galleries.

In looking over the records of these it becomes evident that the bottom of these galleries is generally considered alone with regard to the entrance of water to them. Any inlet from the sides needs very careful guarding to prevent the admission of fine sand, which is more easily kept back in the bottom by the aid of gravity. Further than this it seems that these galleries are not largely increased in capacity by added dimensions; few of them are more than six feet in breadth. Where the volume of water in these galleries is of value to answer sudden call, the expense of their construction may be justifiable, otherwise the system of groups of small wells is cheaper, and will evidently yield all the water available in the locality.

The particular method employed to procure the supply is of less consequence than the fact that such a supply is available. The auxiliary supply of Brooklyn is drawn from between 300 and 400 ordinary driven wells, located for convenience at natural water-courses, the depths of wells and required lift being least in these localities. Such a group of wells will probably secure all the flow for a mile or more on either side of them, provided that their nearness to the sea-shore does not render them liable to deplete the water-level so much as to bring in sea-water.

Jamaica Bay, on Long Island, is an irregular indentation some four miles in width; outside of this is a long

sand point (Rockaway) averaging, perhaps, a quarter of a mile in breadth; the writer was called to provide a water-supply on this point.

As it was some seven miles to the nearest land where water could be obtained by the process adopted for the auxiliary supply of Brooklyn, or else four and one-half miles under the bay to the Brooklyn aqueduct, with a very doubtful chance of being allowed to draw such a supply from the ground there, the writer decided to try what could be found on the point itself, especially as works had to be built there anyway, and would not be lost if it was found afterwards necessary to go ashore for water.

The surface of the sand was irregular, sand dunes and low places alternating; where any considerable area existed, which was not overflowed by exceptional spring tides, the waters in the sand was found sweet and good, in the low places brackish. A well on good ground near the bay was used for the supply of steam tugs; during wet weather it gave good water; in dry weather it became brackish, evidently drawing a part of its supply from the sea at such times.

On this point the writer put down forty-six wells, dodging the low places and getting the best locations available over about a mile of ground lengthwise of the point.

The wells were open—that is, not connected by air-tight connections to the suction-main. They were found capable of yielding from twenty to thirty gallons per minute each, but were gauged to ten gallons, each well being sufficient to yield that supply without depleting the ground-water to the extent of the average rainfall.

The frictional resistance of the water on its passage from the more distant wells to the pumps was made as nearly equal to that from the nearest as practicable, and each well was further controlled by a valve between it and the suction-main; the first effort in pumping showed less than six inches difference in the height of water in all the wells attached.

They were from six to eight inches interior diameter. A part was made by casting the lower joint open, covering the cast-iron with heavy galvanized-iron wire cloth of one-quarter-inch mesh, and this with brass wire of fifty mesh. They were sunk by putting down an outer tube to the depth required, lowering this to place inside and drawing out the outer tube, as such tubes could not be sunk by driving without destroying the covering. The rest of the wells were of perforated tile. To put those down, an outer casing about one foot larger than the tile was sunk two feet deeper than intended for the depth of the well, two feet of the bottom was filled with gravel; the tile, of which about four feet was perforated, having been previously cemented in the joints, was now carefully placed in the centre of the casing and filled in with gravel to about two feet above the perforations; the outer tube being now withdrawn left the tile bedded in gravel. These were the best and cheapest. All the wells were sunk ten feet below the water-surface in the sand.

The reason of describing this plant at length is, that in several cases groups of wells like those driven alongside the Brooklyn aqueduct have been tried on the Atlantic seaboard and some of them have proved failures. The reason may be found in the actions of the well cited as used for the supply of tug-boats.

Where wells are connected to the pumping plant it can be readily seen that those nearest the pumps, by reason of difference in friction, will be drawn on most heavily, and the pumps cannot discriminate; therefore a depletion may occur which will lower the ground-water so much as to bring in sea-water.

With the open wells the plant can be examined and tested at any time, and if any well is yielding bad water it can be stopped without interfering with the rest.

I believe that I am the inventor of this system and that it does not interfere with any of the driven-well patents. You can dig the wells in any way you please and are entirely welcome to any information which this may give. I have not taken out any patents on it.

With regard to quality, we have, unfortunately, as uncertain a problem as in quantity. Filtration presupposes no objectionable qualities in the filtering medium. At Kalamazoo, Mich., the writer placed pumps over a natural spring which had been enlarged into a well. The flow was from sand, the water of crystal clearness, but so hard that it would deposit incrustations of lime on pebbles in the stream.

In the valley of the Missouri and Kansas at Kansas City hundreds of wells have been driven and sunk in the alluvial bottom land, and the apparent character of the same deposit which they penetrate would seem to insure good water, but not one, so far as the writer has knowledge, has given water of a satisfactory quality.

In sinking the sump well at Quindaro for the supply of Kansas City, we found the water rising and falling with the Missouri some 600 feet distant; the well, thirty feet in diameter, was able to yield some 500 gallons per minute, but notwithstanding it has been pumped all this year with a steam-pump for a supply of all the works, at times furnishing over 100 masons and concrete men, it retains its characteristic taste and the men will not drink it.

All along the Missouri wherever I have learned of the characteristics of the ground-water, the same report comes of unfitness for supply. Along the Mississippi below St. Louis where the planters thought they had solved the question of water-supply by driven wells, the outbreak of ague followed their use and they had to be abandoned.

It does not seem possible that all the wells so driven have proved bad, but the reports which the writer has heard for the last dozen years have been remarkably uniform.

* Abstracted from a paper by G. W. Pearsons, read before the Annual Session of the American Water-Works Association held in Minneapolis, July, 1887.

† See our issues of December 6, 1883 and May 28, 1887. - Ed.

The writer, therefore, considers natural filtration a very uncertain dependence, best probably where the distance traversed by the water is least, and depending very much on the purity of the filtering medium.

In some localities valuable supplies may be had from such sources, but in the alluvium of our Southern and Western rivers such a supply, if obtained, is liable to be doubtful in quality.

SHOULD STORAGE RESERVOIRS BE OPEN OR CLOSED?*

GENTLEMEN, in endeavoring to treat upon this very important question, I find myself at the very outset beset with difficulties and knotty problems far beyond the abilities of your humble servant to cope with. Although the title is short and comprehensive, still to enter into a complete digest of all the merits and demerits of both open and closed storage reservoirs requires not only a very careful study of causes and effects, covering a long period of time, but a considerable knowledge of chemistry in order to the more fully explain, to the comprehension of others, the full nature of such causes and effects. We find that we have a large and varied condition of circumstances to contend with, such as climate, capacity, quality of water, temperature, condition of atmosphere, material of which reservoir is constructed, and many other elements and conditions, making the subject one of too great a magnitude to attempt to cover by a single paper before your honorable association. However, I will endeavor to present for your consideration such facts as are readily obtainable with my limited knowledge and ability. In order to avail myself somewhat of the knowledge and experience of others, several months since I sent out over 100 circulars to water-works officials using reservoirs both open and closed, in the form of questions on his subject as follows:

1. Name and address of your system.
2. Is your reservoir open or closed?
3. Capacity of reservoir in gallons.
4. How built, of earth, brick or stone.
5. Source of supply of water.
6. Quality of water before entering reservoir.
7. Quality of water after standing in reservoir.
8. How often do you find it necessary to clean out reservoir?
9. What is the nature of matter taken out in cleaning?
10. Is reservoir troubled with frost; if so, to what extent?
11. Is water affected by action of sun; if so, how can it be prevented?
12. Is water in reservoir affected at times with bad odor or taste, such as fish, woody, musty, nauseous, cucumber, vegetable, or any other disagreeable odor or taste? if so, is it more disagreeable at one time of the year than another, and what time does it occur? how can it be remedied or prevented? is water ever polluted by fungus or mossy growth, such as algae, etc.? in what kind of water is this most likely to occur and how can it be prevented? Please give any other information in your possession bearing upon this subject.

To this I have, at this date, June 28, received several replies, many of which are answers in monosyllables to questions asked, still quite a number are more lengthy and contain much valuable information. I allude to a few of these, bearing more directly on the subject, as follows:

St. Louis, Mo.—Open reservoir; sixty million gallons capacity. Built of earth, stone facing, walls in centre of embankment. Source of supply, Missouri River. Has not yet been cleaned since built in 1871; about one foot of deposit. Water not affected by sun or atmosphere; no fungus or mossy growth, algae or other substance; no bad odor, taste or smell at any time.

Hannibal, Mo.—Open reservoir; one million and a half gallons capacity; water good before being pumped to reservoir; better after standing. Clean once a year; sediment, silt; not perceptibly affected by sun or atmosphere; no fungus or mossy growth; no bad taste or smell at any time.

Quincy, Ill.—Open reservoir, 22,000,000 gallons capacity, built of earth, stone lining. Source of supply, Mississippi River; not yet necessary to clean; in use five years. Has a vegetable growth in summer, a hairy, filthous moss; has a pronounced fishy taste in hot weather, but this does not seem to be due to anything in reservoir, as it is not apparent in water dipped up from reservoir; it is apparently due to some condition of the pipes. We have found it remedied largely by blowing off all the fire-hydrants, and have concluded that the dead or bilgy water in the hydrant connections with the mains gave rise to it.

Muscatine, Iowa.—Reservoir closed; capacity 2,000,000 gallons; built of earth, brick and cement. Source of supply, Mississippi River. Clean out twice a year; sediment, river mud. No bad effect from sun or atmosphere, as after standing a week at a time water seems as good and pure as ever. Reservoir 20 feet deep, sides 128x140 feet, slope 1½ to 1.

William Molis, Superintendent, writes: "In regard to bad taste or odor, we have never experienced any trouble in that way; the only trouble we have is a green scum, a vegetable growth of cryptogamous nature, full of animalcula which an exposure to sun, out of water, gives forth a fetid odor. This growth never goes below the surface, always found on top; the growth is or develops into the snail order, as found by experiment by letting them hatch

out under a glass case, but then we have not found the first sign of them in our pipes, and, on cleaning out reservoir, it disappears entirely. I think all reservoirs in this section of country are affected in the same way."

Savanna, Ills.—Reservoir closed, built of stone and cement; capacity, 800,000 gallons. Source of supply, Mississippi River; at times a little muddy and a slight swampy nature; after standing find water much improved.

W. H. Griffith, Chairman Board of Water Commissioners, writes: "At present, use of water about 1,000,000 gallons per week. We find that cleaning out once a year is sufficient. Sediment, a soft mud of a dark gray color. Have had no trouble with frost whatever. As to the action and effect that sun has on water stored in large reservoirs, my experience has not been very large, still I think the heat of the sun does create a growth of green fungus matter. On a recent visit to St. Catharines, Ont., where the superintendent is a relative of mine, I find that they are troubled with a heavy growth of moss, so that it was difficult to get a small boat through, although the reservoir was thoroughly cleaned every season at great expense. My preventive would be to construct a reservoir such as we have here, cemented on inside, and with a good roof. Clean it out as often as necessary and the trouble of fungus or mossy growth will be obviated."

Decorah, Iowa.—Reservoir closed; capacity, 500,000 gallons; stone, cemented; source of supply, well. Not cleaned since built in 1881. An analysis shows it to be the best water in the city, no bad taste, odor, or fungus growth of any kind.

R. B. Tuttle, Chairman of Water-Works Committee at time works were built in 1881, writes: "I am not a member of City Council at present, but believe that with open reservoirs the utmost care has to be taken to prevent the water from being contaminated by fungus matter that would be prejudicial to the health of those using it. At Sioux City, Iowa, their reservoir is enclosed with a wire screen, and in addition, a man employed by the year to guard it. Diphtheria prevailed, to some extent, in Decorah last winter, and an analysis of the water from the different sources of supply showed that the water taken from the reservoir was the purest that could be obtained. I wish I was more fully able to give you information on a matter of such great importance."

D. C. Fry, Superintendent Water-Works, Jacksonville, Ill., writes: "Our reservoirs are all open; the impounding reservoir holds 80,000,000 gallons, fed from surface water, springs, and from tilled land. Giving a description of the manner reservoirs are built. Have cleaned reservoir every two years; sediment, mud, black dirt, and fish. Are not troubled with frost. Water is affected in distributing reservoir a little by the sun in the month of August; not affected with bad odor. We pump into distributing reservoir every day, which keeps it pure; if allowed to stand for a long time it would become stagnant."

Newport, Ky.—B. P. Merton, Superintendent, writes: "Reservoir open. Capacity 40,000,000 gallons; source of supply, Ohio River; does not need cleaning, although in use fourteen years. Since works have been in operation, there have been but very few occasions when water was affected by bad odor or taste; in those instances it was decidedly fishy. As consumption has increased, and more frequent renewals of supply to the basins, the trouble has ceased. It is about five years since the last case. Have never had any trouble, except in mild or warm weather."

Catskill, N. Y.—Reservoir open; capacity, 4,500,000 gallons; source of supply, Hudson River. F. P. Smith, Superintendent, writes: "Reservoir has not been cleaned since built in 1885; do not consider that action of sun has any effect on water. Water has been affected once in each year since works were put in operation with a fishy odor and an oily, nauseous taste, commencing about May 15 and disappearing in about two weeks. This spring the taste and smell came promptly on time, and I immediately had the mains thoroughly flushed; the taste and smell continued only two days after. My opinion, however, is that the condition of the water is due to other cause than filthy water-mains; but I am not at present prepared to give a decided opinion as to what the cause is."

Akron, O.—H. C. Starr, Secretary and Treasurer, writes: "I can answer some of your easy questions, but the hard ones I will let some one else wrestle with. Reservoir open, 6,000,000 gallons capacity. Source of supply, lake and well; quality about the same as Lake Erie. We keep water in motion by pumping, still, when water is low and sun shining, there will a substance grow and rise on the water of a mossy growth, or perhaps algae. Two years ago we had a severe dose of fishy taste and smell, and have had it mildly at various times since. As to the cause, doctors disagree."

Ithaca, N. Y.—J. L. Morris, of Cornell University, writes: "Reservoir open; capacity, 1,000,000 gallons; supply from Fall Creek; clean out twice a year. Water somewhat affected by sun; remedied by pumping in and opening overflow; sometimes a fishy taste in summer-time; no moss; remedy, open hydrants and blow off. Four open reservoirs well fenced in, too expensive to cover them. Am too busy to write more."

Lynn, Mass.—Reservoir open; capacity, 20,000,000 gallons; source of supply, small streams; cleaned once in thirteen years. Daniel Walden, Superintendent, writes: "After explaining impounding basins, our theory has been that the bad odor and taste came from the ponds being newly made, and our experience would seem to confirm that theory."

Ottumwa, Iowa.—Reservoir open; capacity, 2,000,000

gallons; supply, river; cleaned once in five years. In regard to bad odor and taste, most of them are likely to occur in extreme hot and long drouths. The fishy taste we experienced one."

Cleveland, Ohio.—Reservoir open; capacity, 80,000,000 gallons; supply, Lake Erie; twice in twenty years had the fishy taste in month of July; found water in Lake similarly affected; was accompanied both times by rank growth of algae in reservoir and protracted period of still water in Lake.

Oswego, N. Y.—Reservoir open; capacity, 7,500,000 gallons; supply, Oswego River, with filters; clean reservoir once in two or three years. Months of June, July and August sometimes gives a fishy or cucumber flavor; cannot be remedied except by expensive filtering and aeration. Very little fungus or mossy growth of algae, etc.; remedied by drawing off water, letting sun kill the growth, then clean it out.

Grand Rapids, Mich.—A. C. Sekell writes: "Reservoir open; capacity, 6,000,000 gallons; had fishy taste in times past, but know of no careful studies relating to the cause. Have about 10 miles of wooden pipes in which are many fresh-water sponges. My opinion is that storage reservoirs holding stream or surface water may properly be left open when of large extent and having at least twenty feet depth; when the supply is ground or spring water, storage basins should be covered in as tightly as possible, to the exclusion of all light and air. This, I think, was the opinion of the late Prof. Nichols."

Paterson, N. J.—Four reservoirs, open; capacity, 50,000,000 gallons; supply, Passaic River. When river is low water tastes fishy; river is fed by springs. Pump each day what is consumed, and as water is constantly changing are never troubled with algae.

New Brunswick, N. J.—A. J. Jones, Superintendent, writes: "Reservoir open; capacity, 15,000,000 gallons. Description and drawing showing how built. Clean out once a year; source of supply, Lawrence Brook; of good quality and soft; contains at certain seasons much vegetable matter in suspension, which we believe to be the principal cause of the unpleasant odor and taste occasionally noticed, and which has been the cause of much complaint in past seasons or until 1883, since which it has gradually improved; the taste was of the fishy, woody, cucumber variety of which you speak, and although at times coming as early as June, is not generally noticed until July or August. It is not noticeable in the lake from which the water is drawn, nor was it noticed there when the water in reservoir was particularly objectionable, which led me to seek the cause between the lake and reservoir. After many fruitless efforts in other directions and some attempts to remove it or purify it without filtering the water in the reservoir, I found by experiment that the water, if kept quiet under pressure for two or three days, when released would emit the odor complained of, while if kept in an open vessel for the same period of time appeared to remain in good condition. We then stopped the pumps and left the water standing in the mains for from forty-eight to seventy-two hours, and as a rule it spoiled; since then we never (if possible to avoid it) permit the water to stand in the pumping mains longer than twelve hours, and have had scarcely any trouble, although we sometimes get a trace of it. If our engines are not in operation for a day or two, which is frequently the case with us, we draw off all the water from the pumping mains before starting the pumps again. In the distributing, and particularly where the circulation is not as perfect as it should be, we resort to the frequent blowing off at hydrants. Our reservoirs are kept entirely free from any vegetable growth. I do not offer the foregoing as a solution of the difficulty by any means, but merely give you the benefit of our investigations. I regret my inability to furnish you with more on the subject which might be of service to you in preparing what must certainly form an interesting paper."

Pierre, Dakota.—Superintendent J. W. Troy writes: "Reservoir closed; capacity, 1,000,000 gallons; source of supply, settling well near Missouri River; quality of water, pure and clear as it goes to reservoir. Do not think it would be necessary to clean reservoir oftener than once in two years, as after pumping two years drew off water to clean it, but found nothing to clean out; pails held all the sediment, which was fine sand carried through with the water from settling well. Water in well when not protected from sun develops a fungus or mossy growth, but when protected from sun remains pure. This I have found by experimenting since the subject was discussed at Denver last year. Water in reservoir is not affected at any time with any disagreeable odor or taste, but if drawn off in vessels exposed to sun and air, it would assume a color resembling water that leather had been soaked in, and have odor resembling old rubber. I have made chemical tests of water here and find quite a percentage of magnesia or chalk, with slight trace of iron and very slight trace of organic matter."

Nashville, Tenn.—George Ryer, Superintendent, writes: "Reservoir open; capacity, 2,500,000 gallons; source of supply, Cumberland River; very muddy after heavy rains; clean out once a year; sediment eight to twelve inches deep; water at its worst will settle clear and pure in forty-eight hours. Sediment, composed of sand and clay, becomes offensive when exposed to sun and air. No bad taste or smell at any time and but little mossy growth, and only in July and August, when water is perfectly clear; have called attention of health officer to this growth, and he says it is not deleterious to health, as it is the same as found on stones in pure streams. As to covering of reservoirs, it is my opinion that much depends on localities. If it is distant

*A paper by G. E. Beach, read at the annual convention of American Water-Works Association, Minneapolis, Minn., July, 1887.

from thickly populated districts and manufactories, I do not think it necessary to have them covered, only in very cold climates; if, however they are located within or near manufactories then it may be best to cover them. The affinity which water has for foul gases is readily shown by leaving an open vessel of water in a sleeping apartment where ventilation is poor, and after one night the water becomes very obnoxious. Chemistry informs me that strong traces of ammonia are found in dew taken from grass at considerable distance from manufactories using bituminous coal, which contains considerable free ammonia. This being the case it strikes me that with the great affinity which water has for this particular gas, that large bodies of water would absorb considerable, especially in places where large amounts of soft coal is used as fuel."

From a careful consideration of the foregoing reports and a personal knowledge of the facts connected with many other water-works and reservoirs, we are led to the following conclusions—viz.: That pure water as taken from the earth, either from wells or springs, is by nature very productive of both animal and vegetable life, and that under favorable conditions these productions are spontaneous and without previous germination; still there are certain conditions required to spontaneously produce these growths. Some of the conditions required are as follows—viz.: That the water itself must be practically pure; that it must be of a temperature of at least 50° Fah.; that it must be exposed to sunlight and air; that it must be without pressure or at least not to exceed five to eight pounds pressure per square inch; that it must be without contamination from sewage matter. As an illustration, where reservoirs or basins are over fifteen to twenty feet deep, algae is not known in the water, neither is it known in water polluted with sewage, although the mossy growth may exist in water more polluted than that which would produce algae; as, for instance, the water of the Mississippi River, which carries the sewage of millions of people and domestic animals, is sufficiently polluted to prevent the growth of algae, still in some instances the mossy growth partially thrives; still the water is generally considered fair for domestic purposes. As to what algae is, whether vegetable or animal growth, it is not positively known, but of either class it is evident that it is of the lowest order and produced spontaneously by the action of the sun upon pure water of no great depth. It appears to commence its growth in the early springtime, thriving till May or June, when it appears to mature and release its hold upon the bottoms and sides of reservoirs, rising to the surface and decaying in July and August and producing the nauseous odor and taste so often alluded to; since it would follow that the presence of algae in water is a good evidence of its purity, and to a certain extent the presence of the mossy growth alluded to is also evidence of water comparatively pure. If the above theory is correct the next question to be considered is how to prevent such growth in pure water. This can be done in several ways. First, have reservoirs deep; second, have them covered so as to exclude sunlight and air, which materially aid in keeping temperature at its lowest point; and again by admitting a sufficient amount of sewage or filth to prevent its growth. It is no doubt a fact that many persons in charge of water-works have declined to answer questions on this subject, where the water produced such offensive odor and taste, preferring that the public should be kept in ignorance of the fact if possible, rather than aid in solving an important problem. On May 8 last the writer obtained from a small lake, known as Buell's Lake, near St. Peter, Minn., a quantity of the above-described mossy growth and algae, and has since kept it in Mississippi River water, changing water occasionally. The algae disappeared in a very few days, while the mossy growth partially thrives. The lake referred to is of an area of about eighteen acres, with a varying depth of two to eight feet. Above lake is supposed to be fed by springs, having no visible inlet or outlet, and having a water-shed of less than five acres, the waters of which, from the driest to the dampest seasons, have never been known to vary to exceed one foot. This mossy growth grew thickest on the side of lake from which the springs were supposed to be, and where the depth was least, none growing where water was more than six feet deep. Algae was only found near where the springs were supposed to be located. Samples of this mossy growth will be shown members of convention; an analysis of the waters of above lake has been made but not yet received; if received in time will be submitted to convention.

Now to the main question, Should storage reservoirs be open or closed? it would appear that if water is taken from the ground, either from wells or springs, that it is very important that the reservoirs should be completely covered so as to exclude sunlight and heat, but well ventilated; while water taken from rivers and lakes it is of much less importance, especially when stored in large bodies. Still, where it can be practically done, it would no doubt be much better to exclude sunlight from all storage reservoirs.

THE Vapor Stove Manufacturers' Association of the United States met in Cleveland July 7. Mr. John Ringen, of St. Louis, President of the association, delivered the annual address, and Mr. George Kahle, also of St. Louis, Secretary, read the annual report. The following committee on "Schedule of Prices and Discounts" for the following year was appointed:

William Brandon, of St. Louis; Garson Myers, of Chicago; J. S. Halterman, of Detroit; W. M. Lottridge, and J. L. Alcott, of Cleveland.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

SIR ROBERT RAWLINSON ON "LEAVES OF ABSENCE FOR MUNICIPAL ENGINEERS."

LONDON, 28th June, 1887.

SIR: In your journal of the 18th inst. I notice a kindly leading article on "Leaves of Absence for Municipal Engineers," with the tone and spirit of which I most heartily agree.

Municipal members have a right to be themselves diligent in business and careful of their own time and money, and, consequently, they only act consistently when they are equally careful of official time and money; but both in private and in public life a man may be niggardly and tyrannical, wedding himself to the life of a drudge, and having no consideration for those whose misfortune it is to have to serve him. Heaping up riches, not knowing nor indeed caring who may gather them. Such men may be recommended, each day, to read some passage from the burial service. But probably it would be in vain. Such a man,* whose whole life was spent in heaping up riches, and in refusing every claim made upon him for charity, was once told that he must leave his money to some one, and he the recipient would spend it. This man replied: "He may do whatever he d— he likes with it, but he will never have half the pleasure in spending it that I have in saving it." There can be no beneficial arguing with such men. But, I may be asked, "What has this to do with Leaves of Absence for Municipal Engineers?" Well, my answer is, "A good deal." I wish my remarks and illustrations to be a protest against skinflint narrow-mindedness, and an incentive to moderation in all things, with a sympathetic liberality extending to servants in all ranks and classes. The old childish proverb may be quoted, as regards municipal servants: "All work and no play makes Jack a dull boy." Consequently, the spirit of this old proverb may be made applicable to municipal surveyors. One gin-horse round of grinding work will lead to dullness, where the opposite quality is very much needed. Why, even in our old country, Government and municipal officials have annual leave of absence, amounting to six weeks, as may be arranged for, out of each year; and on special occasions of impaired health, extended to six months on full pay. I approve, sir, of the suggestion in your leader, and most heartily second your plan for annual leave of absence on full pay to local board and municipal surveyors, so that they may enjoy leisure to gain health, and at the same time be enabled to inspect works, in which they are interested, under various conditions. Sanitary engineering is a new science, and as its main purpose is to make health, comfort, and a prolongation of life practicable, its study to a useful purpose must be important.

I have the honor to be, dear Mr. Editor,
Yours very truly, ROBERT RAWLINSON,
Chief Inspector, Local Government Board, England.

DRYING PLASTER IN A HOT-AIR KILN.

SYRACUSE, N. Y., July 5, 1887.

SIR: Having from time to time read your answers to different correspondents you can enlighten me as to why a kiln that I put in does not work. The material in question is much like wet clay and must be dried as quick as possible, as it is a chemical that is used for making wall plaster, and if it is not dried quick the virtue of the chemical is killed, as a chemical action takes place in the pans and causes it to set as hard as stone, whereas, if it is dried quickly it dries in a powder. The greatest difficulty I have is to separate the moisture from the material, as just as soon as it begins to raise a vapor it settles back in the pans, thus keeping it continually damp. The material in question has a strong tendency to hold moisture rather than to throw it off. The kiln in question is 18 feet long, 5 feet high, and 2 feet 5 inches deep, containing fifty-six pans for drying purposes; said pans are run in on tracks after the design of a dresser, with an air-space of 2½ inches between each pan. The pans are eight tiers high, and between each tier there is an air-space of 3 inches running from the coil in the bottom of kiln to the top for the heat to rise through. The pans in said tiers are 2 inches deep with the material in them, 1 inch deep virtually, leaving a space of 3½ inches from bottom of one pan to the top of material in the other.

There is in said kiln thirty-six 1-inch pipes seventeen

* The man who made the remarks quoted was an English city Alderman, who built insanitary cottages for workmen, the combined rents bringing in about £14,000 per annum, and he was Chairman of the Sanitary Committee. R. R.

feet six inches long—equal to 210 square feet of heating surface; besides this there is a box-coil eight feet long, containing sixty pipes—equal to 160 square feet of heating surface—the heat from which is carried to kiln by the use of an 18-inch exhaust fan-blower, which forces heated air into kiln and causes a circulation of air. Out of the top of the kiln I have three ventilators for carrying out the vapor arising from the material as it dries. The material dries now in twenty-four hours as a rule, but has dried in sixteen hours, which is too long a time. I should like to know why it does not dry quicker. There must certainly be heat enough, as the coils are connected direct with boiler, which is run at from forty-five to sixty pounds pressure. I should like to have the material dry in about two or three hours at the outside. If you have any idea as to how I could utilize the kiln and have it do this I should like to have you suggest it; or whether you think it can ever be done so as to do the work required of it. Hoping that you can suggest something,

I remain yours, etc.,

JAMES MORRISON.

P. S.—I send inclosed a sketch of the kiln.

[The problem of drying so much wet material of this nature in so short a time as three hours or thereabouts is one not readily solved by air-currents warmed by steam-pipes, and what you really ask us is to design a drier of a special purpose. The most we can do, however, in such a matter is to present the difficulties that have to be overcome, leaving the details to the inventor.]

The means of drying may be classed under two heads: (1) Evaporating water at low temperatures by absorption into the atmosphere as aqueous vapor; (2) evaporation of water by temperatures above 212° Fah. by driving it off into the atmosphere as steam. By either of these methods for every pound of water converted into vapor or steam 1,000 units of heat (very nearly) is made latent and must be supplied from the heat of either the fire, the steam, the air, or the surrounding objects.

In your case your drawers have a bottom area of about 360 square feet, and if filled with wet, pasty material, one inch thick, will make thirty cubic feet of paste, one-half of which in bulk, it is reasonable to assume, is water, leaving fifteen cubic feet of water to be evaporated, or in other words, 937.5 pounds of water, the equal of 937,500 heat-units, which will represent about 100 pounds in good anthracite coal, burned under a boiler. In other words, if you had this much water in a boiler, or pot, and had to boil it away into the atmosphere, with a fire under it, you would have to burn 100 pounds of good coal in the most scientific manner no matter what the time was. If you wanted to do it in three hours, you must have a boiler of from ten to twelve horse-power, as steam-boilers are rated, and you must burn under it thirty-three pounds of coal each hour.

If you attempt to dry it by warm air the same amount of heat-units will be absorbed and made latent by the "drying up" of the water, and this heat must be abstracted from the air; and as probably one-half the total heat in the air cannot be so abstracted during its passage over the material to be dried, it is reasonable to assume that air containing about 2,000,000 units of heat must be passed during the time of drying, and in this our estimate may be much too low. Approximately, a heat-unit warms 50 cubic feet of air one degree, and if it is warmed 100 degrees by contact with the coils, we have 2,000,000 H. U. $\times 50 + 100 = 1,000,000$ cubic feet of air as the least quantity that must pass in contact with the surface of the materials to be dried, to surrender half its heat for evaporating the water alone.

This is not all, however, for we must see if the 1,000,000 cubic feet of air is capable of taking away the whole of the water in addition to supplying the heat to evaporate it. In this case we may assume the air to enter the heating-chamber at 40° Fah. and be raised to 140° Fah., and then cooled to 90° by surrendering half its heat to the vapor of water while passing through the chamber. Its capacity, afterwards, for holding vapor in suspension is the same as air warmed from 40° to 90°, and under its best conditions—say in winter-time—will be ten grains to the cubic foot, and in summer probably six grains per cubic foot. Taking the latter, then, we have 6,000,000 grains of water (or 857 pounds), that the 1,000,000 cubic feet of air is able to carry off in the summer time if it is doing its utmost. It shows, therefore, it is not quite equal to the task of taking away the 935 pounds of water first assumed, and that probably 2,000,000 cubic feet of air entering the box at from 120° to 140° Fah. will not be an overestimate to do the work you are trying to do by the plant shown in cut. To do it in three hours will require 666,666 cubic feet of air per hour, and a fan of the Briggs type about six feet in diameter, or some other good fan that will pass that amount in an hour.]

HOT-WATER HEATING AND FITTING.

BY "THERMUS."

No. VII.

(Continued from page 45.)

WHEN a pipe enters or passes in through the side of a reservoir or boiler for a short distance the loss caused to the flow of the water by entry is even greater than with a pipe flush with the inside of the tank or boiler, and this loss has been found by experiment to be over .3 of the whole, decreasing the flow of the water one-eighth over a pipe that is flush, and for this reason pipes should never be carried through the side of a boiler or through a junc-

tion or fitting so as to make a projection, unless the obstruction to the flow is no objection or that there is some object of greater importance to be obtained.

When the water leaves the side or top of a boiler through a tapered circular nozzle, the loss by entry is less than when the pipe is parallel at the commencement. When this nozzle or truncated cone has a length of half its greatest (or base) diameter, and its smallest diameter .784

FIG. 19 1/2.

of its base, the flow of water will be augmented as it passes the smaller end, until it approaches to within less than .05 of the theoretical flow; and if the curve of the side of the cone is 1.22 of the diameter of the pipe, as shown in

Fig. 18, the loss will be reduced to about .025 of the theoretical, or a quantity almost too small to take into consideration in ordinary calculations.

If the smallest diameter of the cone therefore forms the area of the flow-pipe the loss of flow by entry is reduced to a minimum, and Fig. 18 gives probably the best proportions for points of entry into pipes or departure from boilers or large fittings, and is the proper form and shape for boiler outlets; and it also could be used to advantage whenever it became necessary to use enlargements or contractions of a pipe, as abruptness in the contractions affect the flow detrimentally, as it increases friction, and for that reason, even with the best form of contracted vein, a coefficient of .05 should be allowed for entry in close calculations even with the best form of vein considered.

Figure 16 shows the *vena-contracta* carried to the extreme. It makes a trumpet-shaped point of entry, which looks well and symmetrical, but withal little if any more water will pass into it under the same pressure than will into a vein similar to the one shown in Fig. 18, and this fact should be enough to impress on us the advantage derived by having the ends of all wrought-iron pipe, or in fact any pipe for hot water, apparatus, reamed to a thin edge with a triangular or conical reamer whose length is just twice its base, as shown in Fig. 19 1/2. In thick pipes, or ones of small diameter that are relatively thick enough can be taken from them in this way to give almost the best form of *vena-contracta* and it will be of immense advantage for elbows and all fittings, not excepting couplings.

The accompanying table No. I. gives the greatest theoretical quantity of water in U. S. gallons that will pass through a short tube whose length is about two diameters, as (shown in Fig. 18,) provided the water is led to it through a contracted vein (termed *vena-contracta*) as there shown.

In reality the commercial pipe standards are somewhat larger than the actual diameter, but this is not taken into consideration in the tables, as the ends of pipes are seldom carefully reamed; the general practice being to cut them with a wheel-cutter, which gives them some contraction. So, for this reason, the nominal size of the pipe is taken as d^2 , therefore the tables are for nominal dimensions of fairly clean standard pipe and not for actual sizes, which are a little larger in all cases, except for $2\frac{1}{2}$ and 8 inch pipe, which happen to be a little under the nominal size; if they are made of standard thickness.

When the end, therefore, of a pipe as it leaves a boiler is square and parallel and no regard paid to a proper form of point of easy entry, then eight-tenths only of the Table No. I. is to be taken as the number of U. S. gallons that will pass through a short fairly smooth nipple, the power to move the remainder being consumed in entry; in other words, instead of getting ten gallons through a short inch pipe or nipple in a minute of time, with a 3-inch head of water as per Table No. I., only eight gallons would be found to pass as given in Table No. II., and so on through the whole table; the remainder that might be expected to flow under such head being consumed in the effort of getting the particles of water into the pipe, overcoming the eddies and giving them direction.

If we divide the heads in Table No. II. into that which is consumed by entry and into that which remains to move the water, it will give us about three-tenths of the total head for entry and seven-tenths for the movement of the water. These amounts remain constants for the quantities of water given and for the size pipes given, no matter how much greater the head at our disposal may be. To make this plainer we may say that so long as only thirty-two gallons of water enters a 3-inch pipe in a minute, regardless of what the total head may be capable of producing, three-tenths about of the 3-inch head in the table (No. II.) is the amount that is consumed by entry.

(TO BE CONTINUED.)

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

BLESSING'S WATER-FILTER AND PURIFIER.

THIS device for filtering consists of three iron cylinders, equal in size, two containing sand and one animal charcoal, which are in diameter from four inches upward to any size desired, being proportioned to amount of water to be filtered, and in capacity from half a gallon to 200 or more gallons per minute. In the smallest sand cylinders made the minimum depth of fine sharp sand is thirty inches, and a greater depth in the cylinders of larger size.

Within the sand cylinders are radial arms mounted on a vertical shaft which can be rotated by a hand-wheel or lever fastened to its upper end for the purpose of agitating the sand during the process of cleansing. The three cylinders rest on base-pieces, in which are chambers that have pipe-connections. The bonnets on upper ends of cylinders being firmly bolted will be strong enough to resist any ordinary pressure, and are connected by means of a short pipe, having in it a rolling valve contained in an outer shell, having four parts or openings, one to admit water to be filtered, two to admit water into the sand cylinders, and one through which impure water is exhausted when sand is washed. A hand-lever is provided for the valve for the purpose of moving it, with a quadrant on one of its ends, and a pointer attached to the valve-case, which indicates the different positions of the valve during the process of filtering and cleansing of the filter.

The animal charcoal is placed in the third cylinder, through which all filtered water must pass before it is ready for use. The cylinder containing the animal charcoal is not provided with radial arms for stirring, as the water is thoroughly strained by passing through the two sharp-sand cylinders. The third cylinder is merely to bring the filtered water in contact with the animal charcoal as a purifier. Air-cocks are provided on the top and bottom of this cylinder to aerate the charcoal when required.

To prevent the sand from escaping from the sand cylinder into the lower chambers, and thence into the system of house-pipes, an important feature is introduced which consists of a plate with a number of holes drilled in it, in which are inserted pins or plungers, about the one-hundredth part of an inch less in diameter than the holes, leaving a space for matter to ooze around each pin or plunger. To prevent these small openings from becoming clogged when in constant use, the pins or plungers are fastened to a plate having a yoke cast on it, into which an eccentric is rotated by a small hand-lever, which extends to the outside of the chambers; this rotation moves the pins up and down through the holes, scraping off any dirt or foreign ingredients that may have gathered there. This device is called a sand-valve.

Figure 1 is the vertical section of the filter with a capacity of five or six gallons per minute, the cylinders being twelve inches internal diameter and forty-two inches long.

Figure 2 is a top view showing a part in horizontal section.

The water to be filtered first enters the valve-casing through the pipe A, and thence through the passages in the casing and pipes B and C into cylinders D and E containing the sand, and thence passing downward through the sand and the sand-valves F and G into chambers H and I, and through the pipe R, J, and K, up into the top of the contact cylinder containing the animal charcoal. The valve L on the top of the pipe K, being kept in a raised position, allows the water to pass downward through

the animal charcoal. The screen Q, placed at the bottom of the cylinder, prevents the escape of the charcoal when the water is passing out into pipe M for house supply. All water is received through pipe A and discharged, filtered and purified, into the pipe M. It will be necessary after running some time to cleanse the sand filter. The valve N is then moved either to the right or left by means of a hand-lever, which will place one or the other of the pipes B or C in communication with the pipe O which connects with the sewer, and will, therefore, carry off all impurities from the sand cylinder during the process of washing. This pipe before entering the sewer has inserted in it an ordinary ball-trap P, with a glass cup, which exhibits the condition of the water coming from the filter during the operation of cleansing, and admits of determining the moment when the filter is sufficiently cleansed.

If the valve N is moved so that the cylinder D and the pipes B and O are in communication, the water will then enter as usual through the pipes A and C into cylinder E, and down through the sand-valve G into the lower chamber I, and through the pipe R into chamber H of cylinder D, and up through the sand-valve F and sand in cylinder D and pipes B and O on its course to the sewer. After the water has been running for a few minutes the sand will become loosened in the cylinder D and the shaft with radial arms attached can then be readily turned by the lever shown on top of same, whose movements thoroughly stir up the sand and remove any adhering particles of dirt which will be carried out with the cleansing water. When the sand in cylinder D has become thoroughly cleansed by reversing the valve N which brings the cylinder E, pipes C and O in communication, the sand in the cylinder E will also be cleansed.

After these operations are accomplished and the valve N returned to its central or working position, filtering through both cylinders will take place.

When necessary to aerate the charcoal the valve L can be screwed down in the top of the pipe K, closing the same and closing cock V, and open air-cock S, and drip-cock T, when the water will run out of the contact cylinder, and air drawn in through the cock S to take its place. When the charcoal has become aerated the filtering process will be continued as before by closing the cocks S and T and opening valves L and V. If it be found necessary to remove the charcoal from its cylinder it can be done by removing the bonnet from the cylinder and scooping the charcoal out, as it is not packed, but lies loosely in the cylinder.

A "by-pass" pipe V is provided, having in it a cock W which permits filtering to continue in the sand-filter independently of the contact cylinder by simply opening the cock W and closing the cocks X and V. Filtration is thus secured at all times without any detention.

The advantages claimed are—viz.: Impossibility of any silt escaping into house-pipes; cleansing the filter without getting one drop of unfiltered water into the house-pipes; of washing one side of the filter with filtered water furnished from the other side, thus washing the filter with filtered water only; a contact cylinder of sufficient capacity to give from four to five minutes contact during the time the filter is working at its full capacity; of aerating the charcoal at any time without removing it from the cylinder; of no appreciable diminution from initial pressure of the water entering the filter, though it passes through seventy-two inches of fine sharp sand and forty-two inches of animal charcoal; that the duplex construction of the filter permits it to be cleansed (in less time than one of single construction) with filtered water only; permits no impure water to be brought in contact with the sand in the lower part of the sand cylinders, which therefore remains absolutely free from earthy matter or other debris.

The cylinders of this duplex filter are usually furnished from four to sixteen inches in diameter, having a capacity of one-half to ten gallons of water per minute.

This filter is patented by Mr. James H. Blessing, and is manufactured by the Albany Steam-Trap Co., No. 78 and 80 Church Street, Albany, N. Y.

Gas and Electricity.

Illuminating Power of Gas in New York City.

E. G. LOVE, Ph.D., *Gas Examiner.*

The twenty-fourth annual meeting of the Gas Institute was held in Glasgow on June 28, 29, and 30, under the presidency of Mr. W. Foulis, Engineer to the Glasgow Gas Trust. Besides the president's address, the papers read were as follows: "Some Notes on the Distillation of Shale for Oil Making, and the Manufacture of Sulphate of Ammonia," by Mr. D. R. Steuart; "The Management of Workmen," etc., by Mr. R. Fish; "Gas from Oil," by Mr. Stevenson Macadam; "Coke," by Mr. C. Caudon; "Gas Coke as a General Fuel," by Mr. C. E. Jones; "A

New Process for the Distillation and Concentration of Chemical Liquids, especially adapted to the Manufacture of Sulphate of Ammonia: Inventor, the late Alexander Angus Croll," by Mr. Anderson; "Gas Legislation," by Mr. W. J. Warner; "The Sliding Scale," by Mr. George Livesey; "The Guide Framing of Gas-holders," by Mr. H. Y. Webber; and "Specific Gravity Apparatus," by Mr. F. Lux. Mr. C. Gaudon, of Sydenham, was elected President for the coming year, and the next meeting will be held in London.

WE have received the volume of proceedings of the American Gas-Light Association for the meeting held at Cincinnati in 1885, and that at Philadelphia in 1886. It is a neat volume of some 360 pages, published by the association presumably under the direction of its secretary, Mr. C. J. R. Humphreys. It embraces the addresses, papers, and discussions which form the proceedings of the association for the past two years, and will be found of value by all interested in the gas industry.

A RECENT report of the German-Edison Company shows that up to the end of 1886 the company had erected 260 installations, representing 1,000 arc lamps and 70,000 incandescent lamps. The company sold 90,000 incandescent lamps in 1886.

ACCORDING to the *Journal für Gasbeleuchtung* the Municipal Council of Dresden are very well satisfied with the results obtained in lighting the Municipal Buildings with incandescent lamps. The dynamo used was a Siemens-Halske, and the lamps the Edison 16-candle power and the Siemens 25-candle power.

In February last the Common Council of Cleveland passed an ordinance reducing the price of gas from \$1.40 to \$1 per thousand feet. About the same time the gas company made a voluntary reduction to \$1.25, but since that has paid no further attention to the ordinance. Legal steps have been taken to compel the company to reduce the price to \$1, or, in other words, to test the question whether the Common Council have the power to fix the price of gas.

THE Chamber of Commerce of Denver have received the report of a committee appointed to "investigate the subject of oil and gas-wells." If the conclusions of this committee prove true, Denver will have a permanent supply of both oil and gas before a great while.

PERSONAL.

MR. W. L. ANDERSON, C. E., of Trenton, has been selected by the Common Council to prepare the plans and superintend the construction of the new sewers.

MESSRS. ALPHONSE FTELEY and W. H. Worthen, M. Am. Soc. C. E., of New York City, have been appointed by the city of Newark, N. J., to examine and report upon the new sewerage works.

AUGUSTUS LAVER, of San Francisco, has been appointed architect of the new City Hall in that city. His plans indicate a cost of about \$3,000,000.

MAJOR W. H. HEUER, Corps of Engineers, U. S. A., has just made a report to the Chief of Engineers on the jetties at the South Pass on the Mississippi River. He speaks of them as a success.

MAYOR HEWITT, of New York City, has accepted the resignation of Commissioner John D. Crimmins, of the Department of Public Works, in a letter complimentary to the Commissioner.

MR. HOWARD MURPHY, C. E., of Philadelphia, has been chosen a member of the State Board of Health of Pennsylvania, in place of Mr. Rudolph Hering, now of Chicago, who resigned.

DR. DAVID ENGLEMAN, of Easton, has been elected President of the Pennsylvania State Board of Health.

MR. R. C. GRAVES, of Memphis, Tenn., offers to furnish from his artesian-well plant water, free of charge, for public baths, if the city will build the bath-house in a designated locality. Water both hot and cold will be furnished.

THE American Association for the Advancement of Science will meet at Columbia College, in New York City, August 10. Professor S. P. Langley, of Washington, will preside.

THE Police Board of Jersey City asks the medical staff to have an analysis made of the Passaic River water to ascertain the truth about the charges made against its fitness for drinking.

CONVENTION OF AMERICAN SOCIETY OF CIVIL ENGINEERS.

CHICAGO, MILWAUKEE AND ST. PAUL RAILWAY,
CHIEF ENGINEER'S OFFICE,
MILWAUKEE, July 19, 1887.

SIR: In your issue of the 9th inst., giving the discussion at the late convention of the American Society of Civil Engineers, at Hotel Kaaterskill, your reporter misconceived the impression I wished to convey in the discussion on cements.

He reports that I said that my experiments showed that, as a general thing, neat cement mortars have less ultimate strength than when sand is added to same. The cements under discussion at the time I made my remarks were the Mantius and Fayetteville brands, which, I am informed, are very active or quick to set, and I said that with such we were apt to get anomalous results, tests of which frequently show less strength neat than when mixed with sand. This anomaly I intended to explain as being brought about through the impracticability of having time sufficient for thorough manipulation into test specimens before incipient setting had taken place. It is well known that any addition of sand appears to defer setting, thus affording time to properly manipulate the mass into homogeneous mortar before setting or partial induration occurs. As a general rule, I believe any addition of sand to cement acts as an adulterant, just as water acts towards whiskey, though not to the same extent. With slow-setting cement mortars my experience teaches that as usually manipulated into test specimens any addition of inert substance, like sand, causes deterioration.

Yours truly, D. J. WHITEMORE.

IN the report of the business meeting of the convention in the issue for July 16, page 181, the resolution on technical education is reported as having been presented by Mr. E. P. North, which requires modification.

The first part requesting the Board of Direction to consider the advisability of appointing such a committee was introduced by Mr. Oberlin Smith, and referred to the Board of Direction. The second part of the resolution, which defined the duties of such a committee, was introduced by Mr. E. P. North, and, after receiving several amendments, was finally laid on the table.

The plans and specifications for the Newark Sewerage scheme were exhibited and explained by J. S. Schaeffer, C. E.

A NEW SUPERVISING ARCHITECT.

THE Secretary of the Treasury has appointed Mr. W. A. Freret to be Supervising Architect of the Treasury in the place of Mr. M. E. Bell. The salary attached to the office is \$4,500 per annum. Mr. Freret was born in New Orleans in January, 1833. He was educated in that city and in Baton Rouge. He studied his profession under John Communy, the well-known civil engineer of the South, who had been educated in the Polytechnic School in Paris. Mr. Freret's first appointment was by Major Beauregard to rebuild the State University at Pineville. He continued the practice of his profession until the breaking out of the war, when he joined the Fifth Company, Washington Artillery. He served on the staff of General E. Kirby Smith in the Kentucky campaign, and remained with him as Major of Engineers until the end of the war, after which he turned his attention to sugar-planting. He was appointed State Engineer by Governor Baker, and served until removed by General Sheridan. He has devoted himself entirely to his profession since 1872. He is a son of William Freret, who was Mayor of New Orleans in 1852. Mr. Freret built the University of Alabama and other large buildings in the South. He was recommended by the Louisiana Congressional delegation, Generals W. S. Hancock and E. Kirby Smith, Senators Coke of Texas and Walthall of Mississippi, and G. B. Nicholson, Chief Engineer Cincinnati Southern Railroad.

DEATH OF HENRY HUSSEY.

HENRY HUSSEY, a respected citizen and one of the leading plumbers of Boston, Mass., died on board the North German steamer "Saale" on July 15 on the return passage from Europe, whither he had gone for the purpose of benefiting his health.

Mr. Hussey was born in England about forty-eight years ago, and came to this country when a boy. He was apprenticed to the firm of Duffy & Hartwell. On the dissolution of the firm Mr. Hussey started in a modest way in the plumbing business for himself, and it was not many years until his ability and energy had placed him in the front rank of his calling. His work can be found in some of the leading mercantile buildings and private residences in Boston and vicinity.

Mr. Hussey had resided at South Boston for fifteen years. He took a great interest in yachting, and he was commodore of the South Boston Yacht Club for three years past—a position he only recently resigned on account of continued ill health. The funeral, which took place on the 19th inst., was largely attended by members of the yacht club and business associates.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

THE prizes offered by the Wells Memorial Association for the best plans of cottages were competed for by nineteen architects, who sent in thirty-nine plans. The first prize, \$50, was awarded to T. Edward Sheehan, 172 Washington Street; second prize, \$30, to G. F. Sprague, 5 Regent Square, Roxbury; third prize, \$20, to William B. Ash, 42 Phillips Street, and a gratuity of \$20 also, to George M. Shinn 8 Exchange Place. The cottages are to cost \$1,000, \$1,500, and \$2,000 above the land. The plans will be on exhibition for a week at the Wells Memorial Workingmen's Institute, 987 Washington Street, and it is then proposed to publish the successful plans for the benefit of the club members and the public.—*Boston Post, July 16.*

ALBANY, N. Y.—Architects will be invited to submit plans for the National Guard Armory to be built on Washington and Lark Streets.

SAVANNAH, GEO.—The Jury of Award on the Court-house plans find no design sufficiently meritorious of acceptance. A new competition will be instituted.

BUFFALO, N. Y.—A movement has been started among leading business men of Buffalo, to raise a fund of \$100,000 to be offered as a prize for the best invention for utilizing the water power of Niagara River. The competition will be open to the world. Several prominent citizens have already subscribed \$1,000 each toward the fund.

PROPOSALS.

(Continued from page 204.)

REBUILDING WHARVES.—Proposals will be received, from regular dealers only, until August 4, 1887, for furnishing at the Navy Yard, Boston, No. 4 spikes and bolts, No. 5 yellow pine lumber, No. 6 red oak piles, all for immediate use. Edward May, Paymaster, U. S. N., Boston, Mass.

IRON BRIDGE over Buck Creek, Springfield, O. Until July 27. Address J. S. Shewalter, City Clerk.

IMPROVING Chestnut Avenue, Jersey City, from Newark Avenue to Pennsylvania Railroad. Until August 1. Address the Board of Public Works. Also, same date, improvement of Cambridge Avenue, of Virginia Avenue, sewer in St. Paul's Avenue, sewer in Tonnelle Avenue.

WIRE ROPE.—Sealed proposals will be received at Memphis, Tenn., until August 5, for furnishing the following quantities of wire strands: 18,000 feet of 3/4-inch wire strand; 10,000 feet of 3/4-inch wire strand. The right is reserved to reject any or all bids and to waive defects. Smith S. Leach, Captain of Engineers.

THE Board of Public Works and Affairs of the city of Nashville, Tenn., will receive bids until August 9, for the construction of a masonry reservoir of a capacity of 50,000,000 gallons with the necessary influent, effluent and gate wells, and other incidental work. Specifications and drawings can be seen at the office of the City Engineer. J. A. Jowett, City Engineer, Nashville, Tenn.

SPECIAL CASTINGS, water-pipe (16-inch), lead, gate-valves. Until July 30. Address Thomas H. Higgins, Chairman of Board of Water Commissioners, Altoona, Pa.

TIN ROOF on lower roof of Pension Building, Washington, D. C. Until August 8. Address M. C. Meigs, Superintendent Engineer and Architect.

WOODEN HULL for dredging boat, 84 feet long, 24 feet wide, 6 feet 4 inches deep. Until August 9. Address Major Amos Stickney, U. S. Engineers, Louisville, Ky.

WHARF at Wood's Holl, Mass. Until July 17. Address C. S. Fairchild, Secretary of the Treasury, Washington, D. C.

WILLOW BRUSH (8,000 cords) and poles (2,000 cords). Until August 1. Address Captain Smith S. Leach, U. S. Engineers, Memphis, Tenn.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 202-204.

WATER. SEWERAGE, ETC.

SACRAMENTO, CAL.—Plans for filtering the water-supply should be sent at once to L. L. Lewes, President of the Sacramento City and County Improvement Association. The association is considering the whole question of a better water-supply.

CARLINVILLE, ILL.—The time for receiving bids for the proposed water-works has been extended to August 15. W. H. Behrens, City Clerk.

NEWBURGH, N. Y.—Commissioners Moshier, McCord and McCann, of the Water Board, and Engineers Caldwell and Hampson have been appointed a committee to obtain prices on a 2,000,000 gallon pumping engine.

KEARNEY, N. J., has contracted with Jersey City to receive water-supplies from the latter's mains at \$67 per 1,000,000 gallons. The Township Board of Kearney will receive proposals for water-pipe until August 8. Address Chairman Davy for further information.

COLUMBUS, O.—The Trustees of the Water-Works are investigating the pumping machinery of several cities with a view to the purchase of new engines for Columbus.

LAKE, ILL.—Mr. J. Frank Foster has been appointed by the Water Committee to prepare plans and specifications for increasing the water-supply from 8,000,000 to 16,000,000 gallons daily. This will include new pumping-engines.

OSHKOSH, WIS.—The city is proposing to buy the water-works, which now belong to private capitalists.

LANCASTER, Pa.—City Councils have voted to carry out the plan for water-supply designated by J. J. R. Croes, C. E., of New York City.

MANSFIELD, MASS.—The Mansfield Water Company held a meeting July 6 and organized as follows: President, D. S. Spaulding; Vice-President and Treasurer, J. W. Rogers; Secretary, J. E. White. The directors are the above-named gentlemen and Messrs. P. M. Blake and F. W. Spaulding. The capital stock is \$55,000, of which \$30,000 has been subscribed, and the remainder is bonded.

FORT WORTH, TEXAS.—A new pumping machinery and filtering plant is being discussed.

OAK CLIFF, TEXAS.—The Oak Cliff Water Company has been chartered, and water-works have been commenced.

BELAIR, MD.—Water-works is being discussed.

BESSEMER, ALA.—The Bessemer Land and Improvement Company will build water-works.

MONTGOMERY, ALA.—Mayor and Council are negotiating with George A. Ellis, C. E., of Durham, N. C., for the preparation of plans for a sewerage system.

ALBANY, N. Y.—City Engineer Andrews is preparing the profiles for a \$100,000 sewer.

LEBANON, PA.—A. H. Tyson, C. E., has presented his report on sources of water-supply to council. Taking Quittapahilla Creek as the source, he finds it will cost to pump the water \$7 to \$8 per 1,000,000.

TRENTON, N. J.—The Common Council have passed a resolution directing that William L. Anderson, C. E., of Trenton, be appointed to prepare plans and specifications for the new intercepting sewers and to superintend their construction.

TALLULAH, GEO.—A bill is before the Georgia State Legislature authorizing the town to construct water-works.

PLYMOUTH, MASS.—A town meeting was held July 7 for further consideration of the improvement of the water-works. The town indorsed the proposal of the majority of the Water Commissioners in establishing two systems of supply for the town. One system will bring water from South Pond by gravity. The central portion of the town and the highlands will be supplied by the present pumping service in separate pipes. The pressure on Main Street and the business portion of the town will be reduced from about 60 feet head to 45 feet, while that on the elevated portions will be raised 30 feet above the present pressure of from 15 to 25 feet.

PARIS, KY.—The contract for building water-works here has been given to Mr. Davenport, of Charleston, W. Va. The cost is about \$100,000.

MILLEDGEVILLE, ILL.—Address Samuel Walker in regard to water-works here.

ALLENTOWN, PA.—The contract for a pumping-engine of 3,000,000 gallons capacity in 24 hours has been awarded to the Knowles Steam-Pump Company, of New York and Boston, at \$17,000. We referred to the opening of the bids in our issue of June 25.

GOLDEN, COL.—Water-supply for the State Industrial School is discussed.

RUTHERFORD PARK, N. J.—The council is considering the construction of a drainage system.

FARGO.—A proposition has been made by the Fargo Water and Steam Company looking to a lease of the city's water-works.

MILWAUKEE, WIS.—The Milwaukee Water-Works Construction Company has been incorporated by George S. Bartlett, George P. Miller, and Henry M. Ellis. The capital stock is \$300,000.

SUSANVILLE, CAL.—A water-supply will be obtained by sinking artesian wells.

GREEN ISLAND, N. Y.—The contract for the new system of sewers has been awarded to Van Vranken & McGowan, of Green Island, they being the lowest aggregate bidders, \$34,334.50. The contract calls for over five miles of sewers of brick and pipe. The system provides for surface water and sewerage, which will be carried to the bed of the stream in the Hudson River at the foot of Hamilton, Bleeker, Swan, and Saratoga Streets, and will be what is called the cross town system. It will require to complete the work 30,000 feet of vitrified pipe, 3,000 feet of brick sewers, and 1,000 feet of iron pipe. The village trustees have ordered the issue of bonds to the amount of \$50,000 for the completion of the work. The contractors will begin excavating on Hamilton Street next week and about four hundred men will be given employment. It will take about two years to complete the work.

MANKATO, MINN.—will issue \$20,000 of water bonds and \$10,000 of sewer bonds.

SAN BUENAVENTURA, CAL., has voted \$20,000 for a sewerage system.

MOLINE, ILL., will lay \$5,000 worth of iron water-pipe this season.

MOORESTOWN, N. J., is raising funds to obtain a water-supply.

VAN WERT, O.—The sewerage movement has resulted in the decision to obtain plans for a system.

VICKSBURG, MISS.—[Special].—The Vicksburg Water-Supply Company, which has been attempting for months to obtain water by sinking wells above the city, has abandoned further efforts in this direction, and will take water from the Mississippi River, near the Refuge mills, two miles from the central portion of the city, where their pumping works, settling tanks, and buildings will be located. Mr. C. Delafield, chief engineer of the contractors, will be here in a few days to complete all the arrangements with a view of putting the works in operation at an early day. About ten miles of pipe are laid, nearly all the hydrants are in place, and the foundation for the stand-pipe has been completed. This is to be located on Castle Hill. The water from the river will be pumped into large tanks and allowed to settle before being distributed throughout the city. The complete works will cost a quarter of a million of dollars.

MALDEN, MASS.—Our correspondent writes: "Water-works have been established here since 1870, water being delivered by gravitation from Spot Pond, in Stoneham. The Legislature of 1887 gave the city right to increase its water-supply by taking water from Martin's Pond in Reading. Some experiments have been made and surveys given, but nothing definite determined as yet."

Later.—On July 18 the Board of Aldermen passed an order to issue \$25,000 of water bonds, also an order "that a joint special committee be appointed, consisting of the president of the council and three others, and the aldermen to consider the advisability of procuring water from Martin's pond; also, that the committee be authorized and directed to investigate and report the probable expense of a further test at Eaton's wells in Maplewood; also that the committee consider the feasibility and probable expense of cleansing and deepening Spot pond."

CALIFORNIA WATER COMPANIES.—The Aurantasia Land and Water Company has filed articles of incorporation. The object is to acquire and develop land and water and water rights in San Bernardino County. The directors are J. D. Vocum, J. G. Nichols, W. L. McAllister, James Noel and H. J. Bovee. Capital stock, \$500,000; amount subscribed, \$270,000.

The Lincoln Park Land and Water Company has filed articles of incorporation. The object is to buy and sell land and water and water rights. The principal office will be at Lincoln Park. The directors are J. A. Wood, J. P. Earle, George W. Wilson, D. K. Shrode, and H. A. Barclay. Capital stock, \$12,000; amount subscribed, \$6,000.

Articles of incorporation have been filed by the Los Angeles East Side Water Company. The object is to supply the city with water. The directors are Edward Records, D. E. Miles, T. E. Rowan, G. A. Dobinson, and W. T. Lambie. Capital stock, \$500,000; amount subscribed, \$250,000.

LA GRANGE, GEO.—Water-works are being discussed.

NEWBURGH, N. Y.—The Committee on Sewers has been instructed to report on the building of a new trunk sewer.

NORWALK, O.—Additional water-supply will be obtained by sinking wells and providing pumping plant.

BELFAST, ME., is putting in water-works.

HERINGTON, KAN.—Our correspondent writes: "Different parties are already figuring on water-works. Water will be taken to reservoir from a spring about one-quarter of a mile distant. No definite action has yet been taken."

ALTOONA, PA.—Measures have been taken to complete Kittanning Reservoir, lay a 16-inch iron main from the city to the reservoir, construct a barn on Mill River, and do other work on the water-supply at an estimated total of \$175,000. Of this the new main will cost \$85,000.

ST. CLOUD, MINN.—Sykes & Co. have been awarded the contract for putting in the sewerage system.

ST. PAUL.—Incorporated is the Manitou Island Water Company to maintain a system of water-works on Manitou Island, White Bear Lake. Principal place of business, St. Paul; capital stock, \$10,000; incorporators, Elias F. Drake, C. P. Noyes, Charles S. Rogers, S. M. Cary, Robert B. C. Bement, all of St. Paul.

ST. CLOUD, MINN.—Bids for the purchase of the city water-works have been opened as follows: Hiram Upham, Minneapolis, \$15,000; H. W. Phelps and Edmund T. Sykes, Minneapolis, \$19,000; C. E. Gray, Fergus Falls, \$20,000.

WHITMAN, MASS.—Our correspondent writes: "We have water-works here, but the past year the town has built a well 100 feet long, and will soon try it to see if water enough can be got in this way to supply the town. We now take it from a pond, and the well is built beside the same pond, and will be tried very soon."

COBLESKILL, N. Y.—An exhibition of the water-works was made before the Fire Underwriters July 16. J. N. Borst is Superintendent.

LOS ANGELES, CAL.—The Pasadena Park Tract Land and Water Company was incorporated July 8. The capital stock is \$240,000, all of which is subscribed. The directors are N. G. Yokum, J. B. Young, A. K. Hanna, James R. Boal and Samuel B. Hunt.

EAST SAGINAW, MICH.—A movement exists here for the sale of the water-works to a company of Eastern capitalists. The water debt is \$410,000.

KALAMAZOO, MICH.—Council Committee are taking steps for the building of lateral sewers.

NEW YORK CITY.—The Commissioners of Charities and Correction will soon begin to improve the Central Islip County Farm. Drainage and water-supply will be proceeded with immediately.

PETERSBURG, ILL.—The citizens here voted in favor of introducing water-works.

CLINTON, IA.—Proposals for water-works here will be soon let.

MARBLEHEAD, MASS.—The town has completed its contract with the Marblehead Water Company for a supply of water for the term of one year, with the privilege of five years, free of charge for fire and domestic purposes and sprinkling streets, and also two drinking troughs on the neck. The company agrees to furnish water to the town or its inhabitants for all other purposes at rates not exceeding those charged in its schedule for 1887. The town agrees that the company shall have the right during the continuance of the contract to use the pipes already laid by the town.

BUFFALO, N. Y.—The Board of Water Commissioners have contracted with the Holly Company of Lockport for a new (50,000,000) twenty million gallon engine. The price is \$98,750 including six boilers. The bids were given in our last issue.

TALLAPOOSA, GEO.—Incorporated is the Tallapoosa Water-Works Company, J. M. Watson, R. L. Spencer, Lloyd Thomas, J. H. Plummer and others.

CLINTON, ILL.—Address Mayor O. E. Harris about water-works to be built here.

MANCHESTER, N. H.—A project is on foot to build a reservoir on Wilson Hill and establish a high-pressure service.

WATER-WORKS are contemplated at the following places: Lockport, Ill.; Baxter Springs, Kan., filtering system at Carrollton, Md.; Washburn, Wis.; Stafford, Kan.; Olneyville, Ill.; Louisville, Neb.; Hillsborough, N. H.

COVINGTON, KY.—July 15 the Trustees of the Covington Reservoir awarded to Peter, Scully & Crane of Cincinnati, the contract for building the new Kentucky Reservoir, to be situated five miles above Newport, Ky. Its capacity is to be 10,000,000 gallons. The bid at which Peter, Scully & Crane received the contract was \$316,377. The contract for pipe and special castings was awarded to the Cincinnati and Newport Iron and Pipe Company, and the contract for laying it to McRae & Lally, of Lockport, N. Y. The work is to be begun at once and to be pushed vigorously to completion. The purchase of the land and right of way has been completed, and Covington will have its new water not later than October, 1888.

PASSAIC, N. J.—The citizens have presented a memorial to councils requesting early construction of the sewerage system after plans by Col. George E. Waring, Jr.

WEIR CITY, KAN., wants proposals for sinking a well for water-supply. Address P. B. Perkins, North Springfield, Mo.

ELLENVILLE, N. Y.—It is proposed to bring water from Fantinkill Stream.

GAS, STEAM, BUILDINGS, ETC.

THE City of Ypsilanti, Mich., will have the street lighted by the Jenney Electric System of towers.

BROOKLYN.—The Brooklyn Subway Commission has approved the plans of the Brooklyn Electric Light and Power Company, of which N. L. Cocheu is General Manager, for placing their wires underground in the Eastern District.

NORFOLK, VA.—The bids for lighting the streets with electric lamps have been rejected, and new proposals will be issued at once.

KANSAS CITY, MO.—Incorporated is the Kansas & Missouri Natural Gas Company; J. L. White, of Jamestown, N. Y., O. B. Stein and Charles Mott, of Kansas City, and others, incorporators.

LYONS, KAN.—The Lyons Natural Gas, Oil and Mineral Company has been incorporated; S. F. Woodward, J. H. Barkman, J. A. Kneisley and others, incorporators.

TOLEDO, O.—Organized is the Cygnet Pipe Line Company to pipe natural gas and oil. Charles Ruprecht is Manager.

KANSAS CITY, MO.—The Kansas City Paola Natural Gas Company will lay pipe from the gas wells at Paola to Kansas City. The company is composed of D. Husted, J. B. Nesbit and J. L. White, of New York City. Boring has already commenced.

GRAYTOWN, O.—The Graytown Natural Gas and Oil Company has been incorporated by S. F. Freese, L. A. Harmon, H. A. Berry and others.

SCHENECTADY, N. Y.—The Gas Light Company will make large additions to its plant.

TOPEKA, KAN.—The Brush Electric Light Company offers to the city to erect seven towers, 150 feet high, on each tower eight Brush arc lights, for \$9,000 yearly for five years.

SHARPSBURG, PA.—Incorporated is the Sharpsburg Electric Light Company; J. G. Nertz.

WEBSTER, MASS.—The Webster Electric Company has been incorporated; N. T. Hurlbut, Waldo Johnson and others.

BELLEVILLE, KAN.—A new incorporation is the Belleville Electric Light Company; Chauncy Perry, S. C. Crummer, G. N. Stevenson.

EAST ST. LOUIS, ILL.—The National Oil Trust Company is incorporated at East St. Louis, capital stock, \$10,000,000 for the purpose of developing petroleum and gas in Illinois and in the Indian Territory; incorporators, William A. Adams, H. T. Flannigan, and E. H. Smith. The Turner and Bogue and Provision Company, at Chicago; capital stock, \$350,000; incorporators, James Turner, C. B. Hogue, and Leo Stein.

MACON, GEO.—The Macon Gas-Light Company will put in machinery to manufacture water-gas and will build a new holder of 100,000 cubic feet capacity.

OWENSBOROUGH, KY.—The gas-works will be enlarged and new pipe laid. Address H. D. Fitch.

ROCHESTER, Wis.—The Rochester Electric-Light and Power Company has been incorporated, with a capital stock of \$30,000. The incorporators are: C. W. Streeter, and W. Walter, Rochester; Theodore Woodbury, Portland, Me.; Henry C. Hodgkins, John V. Clarke, and John F. Moffett, Watertown, N. Y. The company proposes to supply the city with electricity for light and power.

ST. PAUL.—It has been decided to locate the Soldiers' Home provided for by the late Legislature at Minnehaha Falls. There will probably be an extensive park system surrounding it.

OAKLAND, CAL.—Council Committee has recommended making a contract with the Oakland Gas-Light and Heat Co. to light the streets.

FLUSHING, L. I.—The franchise for lighting the streets will be sold August 1. The company obtaining the franchise will be required to finish work in six months. John M. Wilson, President of the Village Board, should be addressed.

HUNTSVILLE, ALA.—Two companies have received right of way for electric lights—viz.: The Huntsville Electric Light Company, Charles Halsey, President, and the Huntsville Light Company, Robert E. Cox, President.

RAILROADS, BRIDGES, CANALS.

OAKLAND, CAL.—The California Bridge Company will have works built at North Oakland for the manufacture of steel and iron bridges. The Judson Iron-Works are the constructors.

CHICAGO.—The ordinance providing for constructing a viaduct for the Chicago, Rock Island, and Pacific Railroad has passed City Council. Plans also have been prepared for a viaduct for the Chicago and Western Indiana Railroad.

ELIZABETH, N. J.—Incorporated is the Union Street Railway Company.

ROCHESTER, N. Y.—The Rome, Watertown, and Ogdensburg Railroad is constructing a bridge over the Genesee River, at a cost of \$100,000, including approaches. The Phoenix Bridge and Iron Company are contractors for the iron-work, and Professor Rickett, of Rensselaer Polytechnic Institute, is Supervising Engineer.

NEW HAVEN, CONN.—The city has closed the sale of its interest in the New Haven and Derby Railroad to W. H. Starbuck, of New York City, for \$275,000.

LOS ANGELES, CAL.—The Los Angeles Cable Railway Company filed articles of incorporation July 8 to build street railways. Directors: I. W. Hellman, C. Forman, S. C. Hubbel, S. P. Jewett, J. F. Crook.

NEW YORK CITY.—The Rapid Transit Commissioners will advertise for plans.

JAMESTOWN, N. Y.—State Engineer E. Sweet and others have examined the Chautauqua Lake outlet with a view to improving its navigation, and will advertise for proposals.

FARGO, DAK.—14,000 square yards of street paving will be done this season.

RAILROAD.—Articles of incorporation were filed with the Secretary of State last week by the Cherokee and Dakota Railroad Company of Dubuque, Iowa, with a capital stock of \$4,000,000. The incorporators are Messrs. Edward T. Jeffery and John C. Welling of Chicago; William J. Knight, M. Gilles, F. W. Quinby, J. Jacobs and William R. Polmeyer.

OMAHA, NEB.—The new bridge will be both a wagon and a railway bridge. F. D. Moore is engineer to the bridge company.

KNOXVILLE, TENN.—On August 1 there will be a city election on the question of voting \$500,000 in city bonds for the Knoxville Southern Railroad and the Powell's Valley Railroad.

RAILROAD.—The Chateaugay, N. Y., Railroad Company, to construct a railroad from near Lyon Mountain, at the westerly terminus of the Chateaugay Railway in Dannemora, and running by the most feasible route through Clinton County and into Franklin County, terminating at or near Saranac Lake village—distance, forty miles, was incorporated July 15. The managers are Smith M. Weed, Andrew Williams, Alvin L. Duman, Willard F. Parkhurst, Milton L. French, William E. Smith, Peter S. Palmer, Roswell A. Weed, and Henry Paris, of Plattsburg; Robert M. Olyphant and Le Grand B. Cannon, of New York; James A. Burden, of Troy, and Edward Hall, of Lyon Mountain.

INDIANAPOLIS, IND.—The Indiana and Lake Michigan Railway Company has been incorporated with \$300,000 capital stock. A road will be built from South Bend in a north-westerly direction to Buchanan, county of Berrien, Michigan. John Schilling, Charles A. Clark, A. S. Dyckman, Jacob Woolveston, William A. Kier, and William G. George are the directors.

OTTAWA, CAN.—It is understood that the contract for the construction of the second section of the Cape Breton Railway, from Grand Narrows to North Sydney, a distance of eighty miles, has been awarded to Mr. James Isbester, contractor, of Ottawa. The contract price is something over half a million dollars.

BETHLEHEM, PA.—On July 14 the Bethlehem Street Railway was chartered to build a road; capital, \$30,000. Hon. Charles Broadhead, R. L. Cope, J. B. Kemerer are among the incorporators.

DES MOINES, IOWA.—The Southside Viaduct Company has been incorporated. The directors are: C. L. Wartous, President; E. N. Curl, Vice-President; J. A. Jackson, Secretary; W. E. Hazen, Treasurer, and Adam Howell, Thomas S. Wright, J. R. Bancroft, C. E. Riser and C. O. Norse. The purpose of the company is to build one or more viaducts in the city of Des Moines.

BRIDGE.—Incorporated is the Burlington and Illinois Bridge Company, of Burlington, Iowa. A wagon bridge will be built across the Mississippi.

ANNISTON, ALA.—The Anniston Land Company will build a street railroad. John M. McKelroy is President.

RAILROADS.—The Denver, Russell Springs and Southeastern Railway Co., of McPherson, Kan., has been incorporated; D. M. Richardson, Denver, Col.; James Worden, Frankfort, Kan.; J. E. Hilty, Russell,

Spring; H. L. Whitford, T. C. Sawyer, and B. A. Allison, incorporators.

The Lincoln and Black Hills Railroad Co., of Central City, Neb., has been incorporated; G. W. Holdrege, president, and J. G. Taylor, secretary.

The Tillamook, Ore., Railway and Lumbering Co. has been organized at Portland, and will build a narrow-gauge road from Garibaldi to the Doherty River.

PASADENA, CAL.—An electric railway is projected from Long Beach to Pasadena. It will connect with the Rock Railroad to Wilson's Peak, thus uniting ocean and mountains. Another electric railway, from Los Angeles to Pasadena, following the Arroyo Seco, is projected by the owners of the electric road at Los Angeles. The Glendale Steam Dummy Railroad, beginning at Los Angeles and following the river toward the mountains, will cross the hills and enter Pasadena. A third electric railway, from Los Angeles to Monrovia, through Alhambra, is projected. The ties are on the ground.

RAILROAD.—William W. Gibbs and associates, of Philadelphia, have bought the old Pennsylvania, Stonington and New England Company's charter and road and will develop the same into a carrying route.

MILWAUKEE.—A street railroad will be built on Jefferson Street to the Grand Haven Dock on Erie Street at the foot of Jefferson Street.

EASTON, N. Y.—The Washington County Railroad Company was incorporated July 15, to build a line from Greenwich to North Granville.

HIGHGATE, VT.—The selectmen have been authorized to have a new bridge built over the river at a cost of \$15,000.

LAWRENCE, MASS.—The contract for the iron-work of the Union Street bridge has been awarded to the Boston Bridge Company, at \$39,790.

RAILROAD.—The contract for improving the St. Paul and Duluth road between White Bear Lake and Northem Pacific junctions has been let to Langdon & Co., of Minneapolis. At the recent meeting of the stockholders plans were adopted for raising \$2,000,000 for improving the line. The grades will be reduced and many curves straightened. Work will be begun at once and the contract completed by the middle of November. The line between St. Paul and White Bear Lake will be similarly improved this fall and the running time shortened to about twenty minutes, a double track being put in eventually.

DEADWOOD, DAK.—The contract has been let for the extension of the Black Hills branch of the Fremont and Elkhorn to Whitehead, eight miles from this city, bed to be ready for track September 1. Surveyors are at work on the line of extension to Deadwood, but rock work will delay the completion of the road this far until next year.

BIDS OPENED.

BROOKLYN.—H. D. Southard has the contract for pavement about the Hall of Records at \$14,749. Blue-stone will be used.

FORT WAYNE, IA.—The water-works commissioners received bids to furnish a pumping engine from the Holly Manufacturing Co., Gordon & Maxwell, H. R. Worthington, the Dean Steam-Pump Co. and the Noll Steam Pumping Co.

BOSTON, MASS.—Proposals for supplying steam-heating apparatus for the Everett and Cushman schools were opened last week. The bids were as follows:

Everett school—Walworth Manufacturing Company, \$3,714; Albert B. Franklin, \$3,240; Brame, Dow & Co., \$3,484; Ingalls & Kendrick, \$3,500; Walker & Pratt Manufacturing Company, \$3,595.

Cushman school—Walworth Manufacturing Company, \$3,287; A. B. Franklin, \$2,970; Brame, Dow & Co., \$3,276; Ingalls & Kendrick, \$3,345; Walker & Pratt Manufacturing Company, \$3,160.

The contracts were awarded to A. B. Franklin.

DETROIT, MICH.—The Board of Public Works received bids July 16 for furnishing four steam-heating boilers for the City Hall, as follows: James H. Davis & Co., of Chicago, \$5,383; Webster & Meathe, of Detroit, \$4,997.

MILWAUKEE, WIS.—Bids were opened July 11 for stone steps in Juneau Park. Proposals ranged from \$900 for Illinois stone to \$1,869.70 for Berlin granite. No award was made.

MONTREAL, CAN.—At a meeting of the Water Committee July 18 the following tenders were received for the new boiler and 15,000,000 gallon engine for the high-level reservoir: Holly Manufacturing Co., \$21,150; Blake Manufacturing Co., \$20,000; Henry R. Worthington, \$20,000; Gilbert & Son, \$22,500.

TAYLOR'S FALLS, WIS.—Bids for the new school-house were as follows: J. L. Bullard, Minneapolis, \$5,125; D. Triel, Minneapolis, \$4,597.75; Thomas Russell, Prescott, Wis., \$4,950; J. H. Miller, Minneapolis, \$4,200. The contract was awarded to J. H. Miller.

NEW YORK CITY.—One bid was received at the Department of Docks on July 21, for granite work and masonry on the boat-landing wall and about the approach to Pier A, North River. The bid was from Joseph Moore, whose figure was \$9,100 and, as it was considered too high, the work will be re-advertised for August 5.

GOVERNMENT WORK.

SYNOPSIS of bids for iron-work, wood flooring, glass, hardware, painting, and polishing for Court-House, etc., Lynchburg, Va., opened July 15 by Supervising Architect of the Treasury Department: John O'Connor, Buffalo, N. Y., \$25,800; Cudell & Lehman, Chicago, Ill., \$22,212; John Mitchell, Louisville, Ky., \$21,272; Harris & Co., Newport, Ky., \$25,584; The Robert Mitchell Furniture Co., Cincinnati, O., \$21,757.

SYNOPSIS of bids for materials and all carpenter-work required for floors and to enclose building, Court-House, etc., New Albany, Ind., opened July 15 by the Supervising Architect of the Treasury Department: John O'Connor, Buffalo, \$14,700; Harris & Co., Newport, Ky., \$5,200; Thomas Brockman, Fremont, O., \$8,931; Cudell & Lehman, Chicago, \$5,226; John Mitchell, Louisville, \$4,790.

WASHINGTON, D. C.—Abstract of proposals opened July 20 by Colonel J. M. Wilson, U. S. A., for laying about 750 square yards of asphalt pavement in Judiciary Square and Washington Circle: H. L. Crawford, \$1.35 per square yard. Contract awarded to them.

NEW YORK CITY.—Bids were opened at the Army Building, on July 20, by Walter McFarland, Lieut.-Col. of Engineers, for building a dyke at Saugerties Harbor, N. Y. The engineer's estimate called for 2,300 feet of dyke. The following were the bidders: Joseph L. Powley, Rondout, N. Y., \$7.93 per lin. foot, total \$18,230; Alexander Sturgeon, Kingston, N. Y., \$8.85 per lin. foot, total \$20,335; John Satterlee, Englewood, N. J., \$8.20 per lin. foot, total \$18,800; Stephen A. Kelly, Brooklyn, N. Y., \$9.65 per lin. foot, total \$22,195; Ross & Sanford, Jersey City, N. J., \$10.40 per lin. foot, total \$23,920; Henry Dubois & Sons, \$6.79 per lin. foot, total \$15,617.

SYNOPSIS of bids for iron and slate work for stairs of Court-House, etc., Erie, Pa., opened July 15 by the Supervising Architect of the Treasury Department: Manly & Cooper Manufacturing Company, Philadelphia, Pa., \$8,487; Marshall Foundry and Construction Company, Pittsburgh, Pa., \$12,726.97; Haugh, Ketcham & Co. Iron Works, Indianapolis, Ind., \$7,066; Champion Iron Fence Company, Kenton, O., \$6,083.40.

SYNOPSIS of bids for furring and lathing for Court-House and Post-Office at Waco, Tex., opened July 13, 1887, by the Supervising Architect of the Treasury Department: Enterprise Wire-Cloth Manufacturing Company, \$1,663.33; Clinton Wire-Cloth Company, \$2,276.92.

SYNOPSIS of bids for iron stairs for Money Order Department of Court-House and Post-Office Building, Columbus, O., opened July 18, 1887, by the Supervising Architect of the Treasury Department: Champion Iron Fence Company, \$421.44.

WASHINGTON, D. C.—The opening of proposals for cast-steel guns has been postponed by Secretary Whitney of the Navy, until September 20.

NEW YORK CITY.—Bids were opened at the Army Building, by Deputy Quartermaster-General Henry C. Hodges, on July 18, for furnishing 100 cubic yards of 3/4-inch broken trap rock, and 200 cubic yards of trap-rock screenings. The following were the bidders: C. A. Brown, 3/4-inch trap-rock, per cubic yard, \$2.10; screenings, per cubic yard, \$2.10. Thomas Hayden, trap-rock, \$2.15; screenings, \$2.15. John H. O'Rourke, rock, \$2.40; screenings, \$2.40. George Cranfor, rock, \$2.40; screenings, \$2.40. Palisade Stone Company, rock, \$1.90; screenings, \$1.90. Alex. J. Howell, rock, \$2.14 1/2 (North River granite, \$2.04 1/2); screenings, \$2.14 1/2 (granite screenings, \$2.04 1/2). Calvin Tomkins, rock, \$2.15 (Tomkins Cove blue stone, \$1.90); screenings, \$1.90 (Tomkins Cove blue stone screenings, \$1.90).

The prices were for cargo lots of about 375 cubic yards. The contract was awarded to the Palisade Stone Co., who were the lowest bidders.

NEW YORK CITY.—Bids were opened at the Army Building, on July 20, by Walter McFarland, Lieut.-Colonel of Engineers, U. S. A., for deepening the channel in Raritan Bay, New Jersey. The engineer's estimate calls for 150,000 cubic yards of dredging. The following were the bidders:

Morris & Cummings Dredging Company, 24 1/2 c. per cubic yard; total, \$36,750. American Dredging Company, 26 c. per cubic yard; total, \$39,000. Thomas Potter, 26 c. per cubic yard; total, \$39,000. Atlantic Dredging Company, 23 1/2 c. per cubic yard; total, \$35,250. P. Sanford Ross, 24 1/2 c. per cubic yard; total, \$36,750.

ABSTRACT of proposals, opened July 19, 1887, at U. S. Engineer's office, Burlington, Vt., for construction of breakwater at Gordon's landing, Lake Champlain, Vt. by Major M. B. Adams, Corps of Engineers:

Nelson W. Fisk, Isle La Motte, Vt., 7,100 cubic yards of rubble stone, furnished and delivered on the work, 83 c. per cubic yard, total \$5,942.80; 3,957 cubic yards of large stone, furnished and delivered on the work, \$2.68 per cubic yard, total \$10,604.76; 184 linear feet of timber, furnished and delivered on the work, 70 c. per foot, total \$128.80; 258 pounds of bolts, spikes and iron, furnished and delivered on the work, 7 c. per pound, total \$18.06; grand total, \$16,834.42.

Mark S. Leavy & John C. Buckley, Albany, N. Y., 8 1/2 c. per cubic yard, total \$5,907; 24 lb. per cubic yard, total \$813.36; 98 c. per linear foot, total \$376.32; 9 c. per pound, total \$23.22; grand total, \$16,119.90.

Stephen V. R. Hendrick, Richville, N. Y., \$2.50 per cubic yard, total \$17,900; 83 c. per cubic yard, total \$13,849.50; 40 c. per linear foot for 280 ft. round timber and 50 c. per linear ft. for 104 ft. of piles, total \$164; 4 c. per pound for drift bolts and spikes, 55 pounds at 6 c. per pound for 203 pounds strap iron and screw and washer bolts, total \$14.38; grand total, \$31,927.88.

John L. Johnson, Fulton, N. Y., 90 c. per cubic yard, total \$6,444; \$2.39 per cubic yard, total \$9,472.23; 60 c. per linear foot, total \$230.40; 5 c. per pound, total \$12.40; grand total, \$16,144.53.

William J. Daly, Ogdensburg, N. Y., 84 c. per cubic yard, total \$6,078.84; \$2.24 per cubic yard, total \$8,863.68; 50 c. per linear foot, total \$192; 6 c. per pound, total \$5.48; grand total, \$15,150.

BURLINGTON, VT.—The following bids for extension of breakwater at Burlington, Vermont, were received by Major M. B. Adams, Corps of Engineers, U. S. A.: James B. Donnelly, Oswego, N. Y., 108,000 ft. b. m., of hemlock timber, delivered, \$23 per m., total \$3,554.14; 82,500 feet b. m., white pine timber, delivered, \$30 per m., total, \$2,475.18; 300 feet b. m. white oak timber, delivered, \$50 per m., total, \$15,000; 26,160 pounds of drift bolts, delivered, 5 cents per pound, total, \$1,308; 768 pounds of screws and washer bolts, delivered, 6 cents per pound, total, \$46.08; 10,128 cubic yards of stone, delivered, 95 cents per cubic yard, total, \$9,621.60; grand total, \$18,023.

John L. Johnson, Fulton, N. Y., \$24 per m. ft., b. m., \$4,752.14; \$33 per m. ft., b. m., \$2,722.70; \$40 per m. ft., b. m., \$14,400; 4 cents per pound, \$1,046.40; 10 cents per pound, \$6,800; 90 cents per cubic yard, \$9,115.20; grand total, \$17,727.64.

Luther Whitney, Keeseville, N. Y., \$24 per m. ft., b. m., \$4,752.14; \$30 per m. ft., b. m., \$2,475.18; \$80 per m. ft., b. m., \$28,800; 4 cents per pound, \$1,046.40; 12 1/2 cents per pound, \$96; 75 cents per cubic yard, \$8,001.12; grand total, \$16,390.64.

Mark S. Leavy & John C. Buckley, Albany, N. Y., \$22 per m. ft., b. m., \$4,356.13; \$30 per m. ft., b. m., \$2,475.18; \$48 per m. ft., b. m., \$17.38; 9 cents per pound, \$2,354.40; 8 cents per pound \$61.44; 93 1/2 cents per cubic yard, \$9,486.56; grand total, \$18,750.99.

Stephen V. R. Hendrick, Richville, N. Y., \$24 per m. ft., b. m., \$4,752.14; \$35 per m. ft., b. m., \$2,887.71; \$50 per m. ft., b. m., \$1,812; 4 cents per pound, \$1,046.40; no bids on screws and bolts; 90 cents per cubic yard, \$9,115.20.

Robert Henry Rogers, Plattsburg, N. Y., \$30 per m. ft., b. m., \$5,940.18; \$40 per m. ft., b. m., \$3,700.24; \$45 per m. ft., b. m., \$1,620; 5 cents per pound, \$1,308; 7 1/2 cents per pound, \$57.60; \$1.23 per cubic yard, \$12,457.44; grand total, \$23,079.66.

MISCELLANEOUS.

NEW YORK CITY.—The Union Dredging Company, who have made numerous contracts for dredging between the piers on the North River at thirty cents per square yard, have cancelled their contracts for work at that figure, and will complete such jobs as are now unfinished at twenty cents per square yard.

The statements which have been published in some of the evening papers, to the effect that the above company were to undertake all future work at the uniform rate of twenty cents per square yard, was erroneous, as all new work will be advertised as heretofore.

A GREAT BRIDGE UNDERTAKING.—I saw General Annokoff yesterday, and he told me that he expected to leave for Hokkaido to complete the Samarand branch of the Transcaspian Railway. The immediate supervision of the whole business having been confided to the two Governors-General of the Amur and Eastern Siberia, who are chiefly under the orders of the Minister of War, the latter's authority in the matter is nearly sure to prevail. Certain Americans have already proposed to connect the Siberian line with the American continent by building a bridge across Behring Strait. There is nothing impossible, it seems, to American or Russian engineers.—*St. Petersburg Correspondent of London Times.*

THE City Council of Mexico has revoked the contract with a water-works company for supplying the citizens with water because of alleged violations of the terms of the contract on the part of the company.

NEW HAVEN, CONN.—Tracy Bros. of Waterbury recently submitted a bid for doing the carpenter and mason work on New Haven's new almshouse, which was \$2,700 lower than their competitors. A commission, composed of citizens and the Board of Selectmen, refused to award the contract to Tracy Bros. because they were not residents of New Haven. John W. Ailing, counsel for Tracy Bros., immediately applied for an order enjoining the commission from awarding the contract to any but the lowest bidders. To-day Judge Stoddard granted the injunction. The case has attracted considerable attention throughout this and other States, the action taken in reference to non-resident bidders being a novel one.

MILWAUKEE, WIS.—The Phoenix Garbage Consuming Company, consisting of Dr. F. A. Marden, William Forrestal, and others, has taken the contract to burn the city's garbage for \$10,000 a year for one year, with the privilege of three years if the city finds it proves satisfactory.

FRESNO, CAL., will spend \$50,000 on improvements.

RAILROADS IN CHINA.—Washington, June 30, 1887.—Consul E. J. Smithers, of Tien Tsin, China, has sent to the State Department a copy of a proclamation from the Viceroy of the Province of Chihli relating to the construction of railways in that province. It sets forth the advantages to be derived from railways, and urges intending stockholders not to "hesitate or delay lest they may by so doing lose their opportunity." More than a month ago the directors of a railway company, composed entirely of Chinese officials, issued a prospectus for constructing a railway between Tien Tsin, Kaiping, and Taku, on the seaboard, and invited Chinese capitalists to subscribe to the stock. But owing to a want of confidence in joint stock companies under Chinese management the Chinese gentry and capitalists held entirely aloof from the undertaking. Now that the Government has granted its support, however, the directors have invited tenders for cross-ties and rails, and it is confidently expected that the road will be constructed before the close of the present year. It will be about 100 miles long.—*N. Y. Herald.*

PORTLAND, ORE., will spend \$2,000,000 in city improvements.

MISSISSIPPI RIVER Commission, at a meeting in New York City July 2, allotted \$456,000 for levees.

MINNEAPOLIS.—President Loring has presented to the Park Commission an estimate for improvements on parks and boulevards amounting to \$11,800.

BATTLE CREEK, MICH.—A sanitary survey with a view to improvements is to be made.

SPRINGFIELD, ILL.—Articles of incorporation of the Havana and Quincy Railway Company have been filed. It is proposed to construct this railway from Havana to Quincy, the principal business offices to be established and maintained at Quincy. The incorporators are W. H. Collins and A. W. Wells, of Quincy; A. K. Lowrey, of Mount Sterling; T. Hamer, of Vermont, Ill.; W. B. Larkworthy, of Quincy; I. N. Pearson, of Macomb, and J. M. Darnell, of Rushville.

MANITOU, COL.—The town has voted to have water-works constructed at a cost of \$40,000.

MINNEAPOLIS.—The Park Commission has decided to put down a cement sidewalk around the Ninth Ward Park to cost \$26,000.

TRADE CATALOGUES.

EXETER MACHINE WORKS, Exeter, N. H., have just issued a catalogue entitled, "Steam for Warming." Steam warming practically considered, illustrating and describing the "Exeter steam-heating apparatus." William Burlingame, Agent and Treasurer, 19 Federal Street, Boston, will send copies of the book on request.

We have just received a catalogue of the Mahony Heater, issued by M. Mahony, Troy, N. Y.

THE Herenden Manufacturing Company, of Geneva, N. Y., has sent us their catalogue illustrating the Furman Steam-Heating Boiler.

PUBLICATIONS RECEIVED.

REPORT OF PROCEEDINGS of the Annual Meeting of the American Gas-Light Association held at Cincinnati, O., October 21, 1885, and Annual Meeting held at Philadelphia, Pa., October 20, 1886. Published by the Association, C. J. Russell Humphreys, Secretary, Lawrence, Mass.

Subscription, 20s. per annum in advance, post paid. } IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

READY-MADE SPECIFICATIONS.

SINCE our reply to "D. M. M." in regard to "Ready-Made Specifications" for heating apparatus we have received several communications from parties who are anxious to furnish them, one gentleman being willing to give the careful experience of twenty-five years abridged into a specification that presumably must be intended to cover all classes of work.

It seems unnecessary for us to explain that these correspondents have misunderstood the intention of our reply to "D. M. M."

A general specification is no specification, and a special specification is applicable only to the particular apparatus and special condition for which it is drawn, and no other.

After about twenty years' experience ourselves in this direction we are forced to declare that we have never been able to make one specification do twice, nor is any qualified professional man satisfied to-day with his specifications written last year. The fact is, if he had to write them over again he would, as a result of experience gained since, be able to improve them, at least, he would change them by modification or enlargement.

We move with the times, and, as progress increases in a ratio somewhat as the square of the times, the specification written now will be much more out of date twelve months hence than; those prepared twelve months ago are out of date now.

A contracting firm which makes a specialty of some particular boiler or apparatus may use a blank specification, and fill it in with the sizes required, etc., for the building they wish to bid on; but a professional man, architect, or engineer, who has any regard for his own or his client's interest, could not present such an instrument to the various bidders.

If he knows what he wants, it is his duty to describe it in the best and plainest manner possible; but when he accepts the stereotyped form of some contracting firm he does an injustice to himself, his client, and the contracting firms whom he asks to make tenders.

Taking the matter of steam-heating for the purpose of illustration, we should say that when an architect or engineer desires bids from several engineering firms he should state the size of the boilers he wants in the simplest language, and what they are to be made of, the size, quality, and location of the radiators, the size of mains, etc. Let him also furnish an ample chimney to his building and then say to the engineering firms he has confidence enough in to invite to bid: "Give me your figure for that work, and say how you usually carry out the details."

If he is young or inexperienced and does not know how to proportion his boiler and heaters or decide between plans submitted, he can consult an engineer who does, and, after once having determined what he wants, let him not fortify his position and throw the responsibility of the warming of the building on the contractor by demanding that if the apparatus he has specified is not ample the contractor must make it good at his own expense, etc., or that the building must be warmed to 70° Fah. when the thermometer is at zero.

General specifications, which say nothing, are the cause of nearly all the failures in steam apparatus.

Competent and careful architects or engineers specify what they want in this respect the same

as they do the minutiae of other building construction, and they would no more copy some other man's specification for a boiler, filling the blank spaces with a thickness or length, than they would some empirical formula they knew nothing about or had not tested for the construction of walls.

Of course, the study of the specifications of known competent architects or engineers will be a great assistance to beginners, and even to experts, and therefore we wish it understood that what we do condemn is the reckless and unadvised use of the whole or part of any specification by a novice.

THE ELECTRIC SUBWAY.

ELSEWHERE in this issue we print a set of rules respecting the stringing of wires overhead, which were adopted at a recent meeting of the Board of Electrical Control in New York City, but have since been referred to an electrical engineer for revision. It is positively stated that permits for this purpose are but temporary, "pending the providing of underground accommodation."

The important provisions are those limiting the lines of poles to but one on each side of each street or avenue for similar electric service. The poles for electric-lights are to be twenty feet high and eight inches in diameter at base at least, and of iron with wood cross-arms. Other poles to be at least sixty feet high. All poles to be at least ten feet from any lamp-post or other pole, and all poles, new and old, to be plainly marked with the initials of the company owning them. No arc, electric-light, or power wires are to be stretched over any portion of any house or building. No new wires to be stretched in streets where conduits are, or are being, provided.

There are also provisions limiting the time that poles may lie upon the ground, requiring permits to be exhibited to every member of the police, or officer or inspector, etc., of the Board of Control, and requiring bonds to be given for certain purposes.

It will be seen that these rules strike at many of the abuses at present existing, and enable those in authority to control this great nuisance and keep it within reasonable limits. The provision prohibiting the stringing of wires for arc-lights over buildings is one which tends greatly to lessen the danger of fire otherwise ensuing.

The statement made by General Averill to the Board of Electrical Control on the strength of some reputed samples of destruction of iron pipe by cement mortar will not bear criticism.

It is a positive and most thoroughly established fact, that our native cements, as a rule, are a protection to iron. This is certainly true of all the Rosendale cements, most, if not all, the Portlands, etc. It is possible that some peculiar cement was used in the case mentioned by General Averill, but it is more likely that there was a dripping of some form of acidulated water, which at last reached the iron and destroyed it. It is not an uncommon thing for iron pipes to be destroyed by the materials surrounding them, and, as we have pointed out in other cases, cement mortar is not so impermeable but that in a length of time the iron would be reached.

The problem of the best system for laying the wires underground is not an easy one, and it will only be solved by patient trial, observation, and study. Meantime the control of the present methods and minimizing the accompanying evils is a move in the right direction.

DETROIT DOCTORS IN COUNCIL.

THE *American Lancet* for July, published in Detroit, contains a discussion by the Detroit Academy of Medicine on the sanitary condition of that city, which will be found amusing reading by sanitary engineers.

The starting point of the debate was a paper by Dr. Samuel P. Duffield, who calculates that Detroit produces 5,479 tons of sewage a month; assumes that if the sewers are not flushed by rain this amount of matter will remain in them, apparently forgetting that the greater part of it will be washed away by the water which conveyed it into the sewers, and declares that traps are useless because "the water of the trap absorbs not only noxious gases, but also germs, and give them

water runs into the sewers except when it rains, also that the house-drains are a source of greater danger than the sewers, and that the city has no provision for the removal of garbage. He said: "We all trust to Providence, and Providence means for us a horde of self-appointed Polack children who carry off what they want—whether it is refuse or not—and deposit the rest in some convenient corner where it may rot in peace."

Dr. Yemans thought that the city has a fine system of sewers. He had explored, with the engineer, one of those most complained of and found it perfectly odorless.

Dr. Connor very wisely remarked that "in this discussion it is evident that we are all somewhat doubtful about existing facts. We argue on probabilities."

And this is the real lesson to be drawn from this discussion. To determine whether Detroit is in bad sanitary condition, and if so to what this is due, requires data which no one who took part in the discussion possessed. The mere gross death-rate of the whole city gives no information on this point beyond pointing out that

ordinary potter. Messrs. Henry Doulton & Co. are to be congratulated upon the possession of such an artist in their works, the more so as they are one of the few firms that appreciate and give recognition of the share their assistants have rendered in making the position that the firm now holds.

In 1883, reference was made in this column to the custom of certain medical journals in connection with notices for advertisers. I refer to this again to emphasize a protest against an existing custom, which is neither beneficial to, nor worthy of, the position of the journals practicing it, nor of productive of special interest to technical readers. The custom I refer to is that of inserting manifold paragraphs. I notice in four journals dealing with engineering and construction this week, a paragraph which is in all, to every purpose, *ipsissima verba*, the only distinction being that in some cases it is abbreviated by the deleting of some of the matter. As with every paragraph of this class the business end is in the tail, where it states that a well-known firm has received orders for goods. It is further a matter for surprise that leading engineering firms should ask and receive the favor of such insertions which are so manifestly only trade puffs.

SAFETY VALVE.

RESIDENCE OF E. N. COOK, BUFFALO, N. Y.—GREEN & WICKS, ARCHITECTS.

up from the wrong side of the trap to hurt our comfort and our health." Every well-educated sanitarian knows that this statement is incorrect, and we are, therefore, not surprised to find Dr. Duffield advising the attempt to ventilate all the sewers by one large shaft heated by a reverberatory furnace, in sublime unconsciousness that this method has been repeatedly tried and found useless.

In the discussion Dr. Andrews says, that of all the cities on the Great Lakes Detroit has the highest mortality (from 21 to 23 per 1,000), and that the cause is probably connected with the sewers, at the same time pointing out the absurdity of Dr. Duffield's ventilating-tower proposition and commenting on the large number of privy-vaults in the city. Dr. Emerson stated that Detroit streets are not cleaned during the winter months, and thought that the rotting wooden pavements were a great cause of disease. Dr. Carstens thought the sewers might be disinfected by steam.

Dr. Lyons did not believe that Detroit has a higher death-rate than other cities, pointed out the fallacy of Dr. Duffield's assumption that no

there is need for investigation. What is needed is definite, precise information as to the mortality rate in different parts of the city and its relations in each section to age and prevailing diseases causing it. With this as a basis a study of the local topography of each district and the character of its population, its drainage and sewerage, etc., can be made practically important, and not otherwise.

OUR BRITISH CORRESPONDENCE.

Artistic Value of a Terra-Cotta Panel—Puffs in Engineering Journals.

LONDON, July 13, 1887.

THE London journals have lately been testifying in high terms to the artistic value of the latest terra-cotta panel executed by Mr. George Tinworth, of Messrs. Doulton's Works, Lambeth. This panel is the largest work in terra-cotta yet executed by Mr. Tinworth, the figures being life-size, and the whole panel measuring 20'x8'9". The subject is, "Christ before Herod." Mr. George Tinworth is not only an artist, but he is also a practical worker, having raised himself by his own ability from the position of an

OUR SPECIAL ILLUSTRATION.

THE subject of our special illustration this week is the Quadrangle of the New University Buildings, Edinburgh, Scotland. R. Rowand Anderson, LL. D., is the architect.

OUR VIGNETTE ILLUSTRATION.

RESIDENCE OF E. N. COOK, BUFFALO, N. Y.—GREEN & WICKS, ARCHITECTS.

THE subject of our vignette illustration this week is the house of Mr. Edward N. Cook, on Delaware Avenue, Buffalo, N. Y. It is of brick and wood, shingled entirely in red-wood shingles. Dining-room and halls in white oak. Library and second-story rooms in red wood. Drawing-room in white pine, painted. Finish in Colonial style. The cost was \$9,000. The architects were Messrs. Green & Wicks, of Buffalo, N. Y.

OUR DETAIL SHEET.

OUR detail sheet this week is a specimen of old Colonial work and shows the garden entrance and *porte cochère* of the residence of G. R. Emmerton, Esq., at Salem, Mass., of which Mr. Arthur Little, of Boston, is the architect. From the door of the platform entrance is had through a small hall to the toilet and coat rooms. The balcony opens from large stair-landing.

PAVEMENTS AND STREET RAILROADS.

No. VIII.

(Continued from page 658, Vol. XV.)

AS THE object of these articles is to give the results of experience under all conditions of practice, we shall in the present article quote from the experience at Omaha as detailed by Mr. Rosewater in the report for 1886. As is well known, the temperature ranges here are extreme, and therefore most trying on any material used for a covering.

Until 1883, the material used for both curbing and paving was Nebraska limestone. This disintegrates rapidly under the action of frost, and was also high in price owing to lack of competition.

Colorado sandstone is much better, and the larger part of the curbing now in use is of this material. To prevent a monopoly, however, Mankato limestone and Berea sandstone are admitted, but they are softer and not so durable.

The result of competition has, however, been a reduction in price in the Colorado sandstone of at least 16 per cent.

Up to 1882 but one street had been paved. This had a Telford macadam twelve inches deep of Nebraska limestone. It soon wore into ruts and became covered with mud. In the fall of that year, as the result of an investigation in other cities, "stone and sheet-asphaltum" were recommended for pavements "on all but steep thoroughfares, and upon grades where stone blocks would not afford sufficient footing to use macadam."

The charter provided that street railways were to pay for paving within their lines, the city paid for street intersections, and property owners for pavements opposite their lots. Funds were raised on twenty-year bonds at six per cent. for intersections. The property owners paid in five installments, at respectively sixty days, one, two, three, and four years, the amount being at first paid by "district bonds." Later on the time of payment for property holders was extended to ten annual payments. The majority of the property holders determine on the material to be used.

A bitter controversy was brought about by the acceptance of a bid to lay Sioux Falls stone under proposals calling for granite. The courts finally decided that it was granite. The result has been that Colorado stone has fallen from \$3.49 in 1884 to \$2.60 in 1886, and Sioux Falls stone to \$2.60 as against \$4.35. Competition has reduced all rates except that for asphaltum, so that wood and stone are the most recent favorites.

Two widely different forms of cross-section have been adopted for streets, depending on whether they were provided with storm-water sewers or not. Where these are provided the gutters are shallow, and the centre of the street is about at the level of the curbs.

In other streets a deep, flat, V-shaped gutter is used, and the street centre is one to six inches below the curbs. The diagrams annexed will illustrate the two forms.

As to foundations for pavements the experience seems to classify them in order of merit as follows: (1) concrete, (2) broken stone and sand, and (3) sand. Even in this frigid climate a concrete foundation six inches thick seems to be ample for all purposes. This statement is made with the reservation that the concrete shall be put down under competent inspection. No great difference in result was found from the use of the various sands of the neighborhood.

As to surface material for pavements sheet-asphaltum is given first place for cleanliness, lightness of traction, and non-absorbent qualities. It requires specialists on the other hand for its maintenance, and where wind and moisture collect on flat grades it rapidly disintegrates. For this reason it is not now used in gutters. Along street-car tracks it is absolutely necessary to provide a toothing of stone to prevent formation of ruts. As to resisting a climate ranging from 35° Fah. below zero to 120° Fah. above, four years' experience decides in its favor. As in all forms of block paving cracks are developed by extreme cold, but they close up closely in summer. It does not seem adapted to grades of over five per cent.

Sioux Falls stone is a quartzite, close-grained, non-absorbent, and frost-proof. It does not break as evenly as granite or sandstone, and as it will probably wear slippery it is recommended that the blocks be limited to three inches thickness. It withstands the heaviest traffic.

Colorado sandstone affords a good footing, and seems to withstand the elements well, but its durability under wear has not been fully tested. Wood can be recommended for its cheapness; compared with the other materials for durability it is not so good.

As to maintenance of paving, the usual difficulties of a constant breaking and opening of streets for all sorts of purposes have been experienced. It is recommended that a price be fixed by ordinance for each such opening, and that before the permit shall issue a deposit be made of funds sufficient to cover the price of restoring and keeping the street surface in repair. This price to be fixed by a contract to be made with some responsible man who shall do all such work.

(TO BE CONTINUED)

A GRAND PIANOFORTE.

THE *Building News*, London, thus describes a pianoforte designed by Mr. L. Alma-Tadema, R. A., for Mr. H. G. Marquand, of New York City:

At the rooms of Messrs. Johnstone, Norman & Co., 67 New Bond Street, W., a very beautiful and artistic pianoforte is to be seen for a few days, when it will be despatched to its owner, Mr. Marquand, of New York. The case of this costly pianoforte has been designed by Mr. L. Alma-Tadema, R. A., and contains a beautiful painting, by Mr. E. J. Poynter, R. A. About three years ago Mr. Alma-Tadema recommended to Mr. Marquand, a gentleman of large fortune and of cultivated taste, the firm of Messrs. Johnstone, Norman & Co., to undertake the execution of some classic furniture for a music-room of a new house he was erecting in New York. Acting upon Mr. Alma-Tadema's advice, Mr. Marquand came to London, and entrusted the above firm with the commission without limit of price. In 1885 the first portion of the costly and classical furniture was completed, consisting of couches, chairs, stools, cabinets, and tables, made of ebony, cedar, ivory, and boxwood, inlaid with mother-of-pearl, and the tables of Algerian onyx. The "grand" pianoforte has been in hand for three years, and in every particular is in harmony with the suite of furniture. The case is of ebony of the finest quality, enriched by marquetry or inlays of cedar, box, ivory, mother-of-pearl, coral, jeweled here and there with rubies and pearls. We can give but a very inadequate idea of the beauty of the design, the details, and the charming delicacy of color of this sumptuous work of art, destined to receive the instrumental part by the eminent firm of Steinway & Sons, of New York. It is needless to say Messrs. Johnstone, Norman & Co. have carried out their portion of the work with the greatest of skill and good taste, under the supervision of their artist, Mr. C. Codman. On the sides of the case the design is of the most classic character. Round the lower edge runs a band or string of ivory, inlaid with an ebony key-fret of Greek design, studded in the convolutions of the fret with rubies and pearls. Round the top is a member of cedar wood, an egg-and-tongue enrichment of boxwood, finished with a delicate beading of ivory carved with the bead-and-reel ornament. The sides, or ebony ground, between these borders, is decorated by marquetry carved in relief in the form of Greek scrolls; those next the keyboard on each side being of bold classical foliage, chiefly in cedar, ivory, and mother-of-pearl. The same carved and inlaid scrollwork is carried round the back or end of the case, which, being curved at the corners, required the utmost skill and care in manipulation, as each piece of ivory and mother-of-pearl in the volutes had to be cut out of the solid to the circular corners and shaped to the double curvature. Between the Greek scrollings in the centre of each side is a wreath of marquetry. The top side of the piano is inlaid with a series of wreaths enclosing the names of the Muses in Greek characters; these are inlaid in ivory and mother-of-pearl, the interspaces between the wreaths being enriched by ribbons ending in coral and mother-of-pearl studs. The front part of the lid over the keyboard has a central wreath with the name of Apollo. On the under side of lid the surface is formed into panels by Guilloche bands in cedar and ivory inlay, the panels being vellum-covered for the autographs of great players. The music-rest is cut out of one piece of brass inlaid with copper and silver, of very rich design; the Greek anthemion and scrollwork pierced in brass flanks the book-rest and supports the candles. In the centre of the end of case, in the side, is a plaque in repousse silver, with Greek lyre; but the chief work of art remains to be described in the very beautiful composition painted by Mr. E. J. Poynter, R. A., on the "fall" of the keyboard. The scene depicted with so much grace, delicacy, and classic feeling is entitled "The Wandering Minstrels," and represents what we may imagine to be a Pompeian garden scene. At each end are open verandas with trellis-work, their roofs laden with roses and foliage. Under the right-hand trellis sit minstrels playing, at the other sit the chief members of the family, while a centre group of maidens are engaged in the dance. Beyond the garden is a beautiful bay. This work takes the place of Mr. Poynter's contribution to the Royal Academy. On each side ornaments of musical and terpsichorean emblems are introduced.

The side supports are massive, almost Roman in design; they are winged lions carved in old English oak and inlaid; the pedal is thoroughly architectural in design, being a couple of Greek Doric columns fluted in cedar, with entablature, the triglyphs and metopes being delicately wrought. We have before seen costly and beautifully-painted pianoforte cases to which our leading painters have contributed their art; but this one, executed by artists in Messrs. Johnstone, Norman & Co.'s employ, from the design of Mr. Alma-Tadema, R. A., surpasses them in architectural character and in thoroughness of decorative design.

ARCHITECTURE IN THE REIGN OF QUEEN VICTORIA.

IN two subjects not precisely architectural, in the common meaning of the word, but of the highest practical importance, there has been an extraordinary progress during the last fifty years. One of these is the science of sanitation, which may be said to belong to this reign. Fifty years ago the current ideas upon the subject of drainage and ventilation were comparatively of the crudest kind, and it was hardly recognized that the subject was one specially demanding an architect's attention, except so far as some general perfunctory attention to fall and brick traps was concerned. A good many of the artistic architects are much in default in this respect now, but the knowledge that they are so, and that sanitation is a subject which some one, at all events, must attend to, is forced upon them; and in general there is now a degree of study given to the sanitary requirements of buildings which was not dreamed of fifty years ago; a study which, it may be added, has resulted in the condemnation or absolute reversal of some of the sanitary beliefs and expedients of that period. The other subject we refer to is the progress in regard to the improvement in the habitations of the poorer classes, and the recognition, to some extent at least, of the responsibility resting with landlords and with the Government in regard to this subject. The part taken many years ago by this journal in urging attention to this subject is known to all who are acquainted with the history of the amelioration of artisans' dwellings; and though much remains to be done in this respect, what has been already accomplished may count among the architectural achievements of the present reign; and while we have witnessed the foundation of a new cathedral (unfortunately only a good mediæval copy and with no Victorian cachet about it), we may, perhaps, be justified in thinking that the many blocks of healthy dwellings which have been built during late years, not indeed beautiful architecturally, but representing the possibility of decent, comfortable, and healthy housing for the poor, are as important architectural works in their way as cathedrals and churches. In regard to sanitary progress, by the way, it is worth remarking that one of the most recent pieces of work for which public money was voted was the rectification and putting on a proper and efficient footing the drainage of that same great House of Legislation, the commencement of which was nearly coincident with the commencement of the present reign; the architecture was done fifty years ago, and adequate drainage supplied now—a significant indication of the progress in practical matters which has been made during the period we are considering.

Though there has been a good deal said of late as to the desirability of drawing architecture and engineering closer together, as a matter of fact the two professions are farther dissociated in the manner and aspect of their works than ever; and the greatest piece of constructional work at present going on, the greatest in some ways that has been attempted, is the gigantic structure at the Firth of Forth, from which everything that we generally call architectural design has been entirely eliminated, nothing being left, so to speak, but the bare polls of construction. Such a work as this is an appropriate culmination to a half-century in which the most numerous and remarkable constructional works have certainly been those of the engineers. Engineering has known what it wanted, and the public have known what they wanted from it; that is the secret. In architecture there has been doubt and experimenting on one side, and a good deal of public indifference on the other side. As to the latter drawback, we see little immediate prospect of improvement; architecture is still a kind of sealed book, and a subject of indifference to the public, but the art itself appears to be in a healthier and more promising condition than it was at the beginning of the present reign; it has more of life and originality, is less fettered by precedent, and has a sounder basis of sanitary and constructional knowledge; and these are conditions which may make us hopeful for the future achievements of English architecture during the remainder of a reign which we all trust may still be prolonged for many years.

—Abstract from an article in *The Builder*.

THE POUGHKEEPSIE BRIDGE.*

At the meeting of the Society held July 4, J. F. O'Rourke, of the Union Bridge Co., Chief Engineer in charge of building the Poughkeepsie Bridge, read a paper on the origin of the enterprise, progress of the work, etc. Mr. O'Rourke's paper showed that during 1876 the promoters of the project of building a bridge across the Hudson River at Poughkeepsie had surveys made and the engineering features examined. Eminent authorities were consulted as to the possibility of spanning 2,600 feet between the shores with a suspension bridge. Among others, Captain Eads declared the span too long for practicability, and recommended four piers in the river 500 feet minimum space in the clear between. These facts being presented at the following meeting of the Legislature, an amendment of the bridge charter was obtained permitting the construction of the piers. In 1873 the Pennsylvania Railroad Company, as represented by J. Edgar Thomson and A. L. Dennis, subscribed \$1,100,000 in a capital stock of \$2,000,000, and the control of the company passed into the hands of those gentlemen, and the immediate building of the structure seemed assured. The charter required that the work should be begun before January 1, 1874; so a part of a foundation of a pier was built, and on December 17, 1873, the corner-stone was laid with elaborate ceremonies. The financial world was at the time suffering from panic, and money was hard to get. During that winter Mr. Thomson died, and his estate did not wish to go into the work of building the bridge, and the Pennsylvania Railroad Company voted that no new work should be undertaken without the consent of the stockholders, which could not be obtained. So the project rested until 1876, when a contract was entered into with the American Bridge Company, and the actual work of building was begun. The latter company built the pier next to the west shore 20 feet above high water. The crib of the next pier was built 96 feet high, and sunk through 55 feet of water and 40 feet of the river bed, so that the top was one foot above high water. Thirty-six feet of another crib was built, but not placed, and then, in September, 1878, the American Bridge Company suspended work. From that time until last fall nothing was done but to keep the charter alive with extensions. At that time a number of gentlemen forming the Manhattan Bridge Building Company took up the project. That company acquired the rights of the American Bridge Company's assignees and made a contract with the Union Bridge Company for the building of the structure. These companies treated the work as if it was entirely new, regarding the pier and crib as in a sense topographical features, and in September last operations were begun. A line practically the same as the old one was run, a rapid triangulation survey was made, and borings were made through the river-bed to rock. The former design was for rectangular trusses of equal lengths. The position and length of the second span were fixed by the positions of Pier 2 and by the fact of the masonry being 25 feet wide and the charter requirement of 500 feet in the clear between the piers. The same length of span to west would place Pier 1 in the West Shore tracks. At this time a cantilever design had been decided on, and the 548 feet necessary to reach over the highway was adopted for the two other cantilever spans, which, with the connecting ones of 525 feet, located Pier 6 in the face of the bluffs on the east shore. The charter fixed the head-room at 130 feet, and the height of trusses necessary for the spans required the adoption of 212 feet above high water as the grade of base of rail. The west approach of the bridge has a rise of 66 feet per mile, to get out of the valley, and the same grade was adopted on the viaducts. After the adoption of the general design, the next thing was an accurate location, which was accomplished by well-known rules, and the work proper was begun on October 8, 1886, with excavations of foundations for shore piers. The masonry of Pier 6 began December 6, 1886, was finished February 17, 1887; Pier 1 was begun January 7, 1887, and finished March 17. The east anchorage pier was begun February 8 and completed March 23, and the west anchorage pier was begun January 26 and finished May 9. All the shore work is of the ordinary character of first-class bridge masonry, the anchorage piers being an exception. They have built in them iron girders capable of carrying all the pier above if sufficient force were applied to the anchorage bars to raise that much weight. The borings show the river bottom to be various combinations of mud, clay, and fine sand, extending down at least 100 feet below high water. Underlying this pasty stuff is a very firm and hard stratum of rather coarse sand under which is gravel, and about 140 feet down is solid rock extending from shore to shore, and it was assumed that Pier 3 would go to 120 feet below high water; Pier 4, 125 feet, and Pier 5, 135 feet. Briefly describing the cribs, Mr. O'Rourke said a crib or pier is composed of solid timber and concrete 60x100 feet in area and 115 feet in height. On the crib is placed a platform of solid timber, of nearly the same area, on which is built the masonry. Resting on the masonry of each of the piers is a steel tower 100 feet in height, on which rests the lower chord of a bridge truss. The height of the latter, including the floor system, beams, tracks, etc., will be 82 feet, so that from the bottom of the pier to the track is 347 feet, 212 feet of which is above high water. From high water to the lower chord of the bridge the distance will be 135 feet, much higher than the masts of the largest ship in the world.

* Abstract of a paper by J. F. O'Rourke of the Union Bridge Company, read before the American Society of Civil Engineers at the recent Annual Convention.

PRIVATE WATER COMPANIES.

THEIR RELATION TO MUNICIPAL AUTHORITIES AND THE PUBLIC.*

NO ONE could attempt to prepare a paper upon a subject so important as the one assigned to me without feeling a strong desire to know something about the work of those men who were the first to undertake the construction of water-works with private property, and who, doubtless, without suspecting it, introduced by their own success new opportunities for the exercise of judgment and skill in providing pure water for the public good.

Not wholly out of place here would be a paper devoted to a description of the works established in 1581 by Peter Maurice, who rented the first pier of London bridge for five hundred years at ten shillings per annum, and the next season brought out the Mayor and Aldermen to see him throw water over St. Magnus' steeple, "the like of which had never been seen in all London," and the like of which was not seen where promised in some of our own cities three hundred years afterwards. It would also be interesting to turn over the pages of some musty volumes and make notes concerning "these plugs which are no sooner opened than there are vast quantities of water." And "this plenty of water has been attended with another advantage: it has given rise to several companies to insure houses and goods from fire; another advantage which is not to be met with in any other nation on earth."

A little careful study might make it clear that the private water company and the municipal authorities were the happy parents of our modest and thrifty fire insurance company; but there are those better fitted for such investigations, and I trust they may be pursued by some member at a future meeting, when it is to be hoped the necessity for reference to what is being done in our land may not be as great as it is now.

A large, and, I think, an increasing proportion of the members of this association are the superintendents of private companies. Some are in charge of works that are well designed and carefully constructed, and others in charge of works about which fewer good words can be said. Any discussion of the causes that operated to produce in one instance a good plant, and in another a very poor one, will be of interest to you all, and of such causes or influences it could easily be shown that those first exerted are likely to be the most potent. To this class, including the early negotiations between private companies and the authorities of cities, this paper will be limited.

In order to be more easily understood, and because I like the inductive method, of which an excellent example was set for me last season by one of your members, I will beg your attention to conditions that are liable to be met with, merely assuring you that I have not the creative genius of Cervantes, and that I will not lead you to the pioneer city with a boom from which anything ridiculous might be expected.

You may call to mind a city of three or four thousand inhabitants, pleasantly located upon a terrace overlooking a river into which a small creek flows. Within a radius of a mile or two there are two or three beautiful lakes. Good water-power and railway facilities are available, and the city and the surrounding country are in a prosperous condition.

At a September council meeting a stranger appears who says the city is large enough to have water-works, and mentions two or three towns where works have just been built. The Mayor has for some time thought his city needed works; several members of the council have expressed the same opinion, and all see the force of one point made by the stranger. Up to that time water-works had never been built in their city, and might never be unless he (the stranger) built them at once. He would take water from the creek. It was, curiously enough, supplied from springs. He asks to have them appoint a committee to report at a special meeting, as his visit must be short.

Here let me introduce the official record of a special meeting:

"Hon. A. B. C. submitted the report of the committee appointed to examine the creek and its sources. As to the purity of the water, there was no doubt in the minds of the committee; as to its volume, they would not commit themselves, but merely submit measurements of the springs in full as follows:

"Spring No. 1, 20 inches wide and 4 inches deep; Nos. 2 and 3, each 12 inches wide and 2 inches deep; No. 4, 24 inches wide and 6 inches deep; No. 5, 16 inches wide and 6 inches deep; No. 6, 24 inches wide and 4 inches deep, and No. 7, 14 inches wide and 2 inches deep."

You will observe that no reference to velocity is included, and, doubtless, it was not thought of by the committee. Had they given their measurement, spring No. 4 was flowing 1,500,000 gallons per day. They simply cross-sectioned so much more or less stagnant water. But to go on with the record:

"Dr. D. E. F. addressed the council upon the purity of water and suggested more time to consider the subject. A spirited discussion followed which developed an overwhelming sentiment in favor of Blank Creek and a speedy execution of a contract for the erection of water-works."

The stranger departed with a franchise in which the city's interests were undesirably bound up for thirty years or more, and although he might succeed in disposing of it and securing through others the creation of works, the possibilities are that the company willing to pay the

* A paper by H. F. Dunham, read before the annual Convention American Water Works Association, Minneapolis, Minn., July, 1887.

largest sum would build under it the poorest works and do the city the greatest harm.

But it may be urged that this is an instance of contract making without competition, and for that reason quite exceptional and not a fair illustration of actual conditions.

Let us turn over the record—imaginary, of course—of a larger city, population 6,000, where the subject of water-works has been under consideration for several months, and propositions from water-works companies have been solicited through the papers. The city lies upon a gentle slope in the centre of a drainage area about one-third larger than the area of the city itself. The soil is a compact clay resting upon limestone, and the wash from the drainage area and the city streets forms, in a wet season, a small brook which crosses the corporation line through some low ground. Near this brook an old resident has an inexhaustible well. We will also assume that there is no suitable source of supply within a radius of three miles.

For a week previous to the date of opening bids there hung in the council chamber a large map of the city showing by heavy lines the location of the proposed pipes, and bearing in one corner an inscription like this: "Hydrants eighty. Total pipe nine miles, only four or five miles of which need to be of full size."

It is further understood that the pumping station is to be built upon the low ground and within the city limits, otherwise it could not be taxed by the city.

When the bids are opened we need not be surprised to find that each competitor proposed to take water from the point designated by the city. Two of the bids received more attention than any of the others. They named substantially the same rentals and rates. One called for more elaborate and expensive machinery, and the other for better pipe system and a large reservoir. Works constructed under bid No. 2 would cost about \$20,000 more than works to comply with bid No. 1.

The representatives of the two companies, each with a few friends in the council, take in the situation in a glance. They have met before and they meet again in another city. One is not quite certain but he described a larger reservoir than the city needs. The other is very positive that the city needs no reservoir at all. They work together with a common purpose and as one man.

Just here let us imagine—as no such thing would be likely to occur—that one bid was for taking water from a reasonable source three miles away and for a reasonable rental. There would not be a possibility of the acceptance of such a bid. The chances are ten to one that the best bid offered would be rejected and that city, like the one already cited, would be burdened with a franchise in which it requires no engineering or other ability to read future mortality statistics.

I know that when errors are apparent in completed works it is natural to cry fraud and to throw the whole blame at some one's feet, but this paper will fail in its purpose if it does not help us to a wider and in one sense a more charitable view. The bad and the indifferent works established throughout the country are but the natural results of influences, sentiments, business and unbusiness relations which could only be changed very slowly, and they are not well enough understood now to enable any one to foresee or limit the absurdities to which they may give rise.

So long as municipal authorities are profoundly ignorant or culpably indifferent, it may be expected some one will be ready to secure a seeming advantage. To educate and interest such bodies, changed as they are by every political breeze and by every other breeze, is equivalent to educating and interesting the whole community. Turning to private companies, there is more to encourage us. Their standard, although advanced by their own efforts chiefly, is being advanced. From an attempt to make the best possible trade, up to a determination to build only such works in any city as that city ought to have built, is a long step forward and one that was not, or will not be, quickly made.

In the meantime—which is now—any safeguards that will help to diminish the number of ill-assorted contracts ought to be recognized, and that heedless parent, the State, cannot be too severely criticised for neglecting to provide and furnish to every city within her borders such general directions about the character of the works required and the proper source of supply as would go far to ward off the hasty agreement and its ruinous results. In the absence of such assistance organized individual labor would be of great service. Such careful work as that done by the Appalachian Club in topography and geology, would have no less to commend it if it bore a still closer relation to the health of communities. Just how much should be undertaken by scientific men, and the men of leisure, by chemists, engineers, and others, I do not attempt to say, and I urge nothing unprofessional, although I believe that no man's opportunities are lessened by the patient accumulation of facts and the intelligent use of them. We know that when water rises into the atmosphere it is watched by a hundred men, and very probably too, in its course from Puget's Sound to Eastport, if it goes so far, but after it falls to the ground it receives too little notice unless its shadow darkens the page of some physician's journal. In the years before us this must be changed.

TIDY ON TREATMENT OF SEWAGE.

DR. C. MEYMOTT TIDY's paper on the Treatment of Sewage, recently published in the *Journal of the Society of Arts*, has been reprinted by D. Van Nostrand, of this city, and is No. 94 of Van Nostrand's Science Series. In this compact form this valuable contribution to the literature on this subject is now available to any one interested for the small sum of fifty cents.

FILTRATION OR SUBSIDENCE.*

The most Practicable and Economical Method of obtaining a Supply of Clear Water from Streams Carrying Considerable Quantities of Silt.

INFERENTIALLY, the discussion of this topic necessarily takes wider range than the comparative merits of the two systems under consideration—for the mere clarification of turbid waters from running streams, a result which under average conditions can generally be accomplished by either process—variable only as to time and with the distinctive characteristics of the objectionable constituents held in suspension, while soluble coloring matter, as a rule, is practically irremovable by either, or by any other process short of chemical agency. In the case of ordinary filtration, the theory seems a tenable one, that under certain conditions, such as long usage, unfrequent cleansing, etc., the filter, while uniformly producing limpidity and apparent purification, may in reality become a dangerous source of contamination. The fact of effective filtration of sedimentary water presupposes a proportionate clogging of the filter, gradually though steadily reducing its filtering capacity by retaining the lees or residuum within the interstices of the filtering material, a proportion of which, if not speedily and thoroughly removed, tends to harden and become attached to the material, permanently retarding the flow, while another portion is subject to decomposition into soluble gases, their nature and origin depending upon the primal nature of suspended impurities, whether mineral, vegetable, or animal, contaminating the subsequent filtrate with constituents vastly more harmful and also irremovable by any process short of actual distillation.

It is claimed, with more or less semblance of logic, that organic impurities, or the major portion of them, are absorbed and neutralized by the use of charcoal, animal and vegetable, "spongy iron," coke, etc., as a filtering material; that such material, especially charcoal, and possibly coke, will absorb gases to the extent of about eighty times its own volume. Nevertheless, we are unable to reach anything like a satisfactory formula for determining the volume of water that would be actually purified through such agency, or the length of time required for charcoal to become fully charged and inoperative as a purifying agent—when it will cease to act chemically and become, like sand or other filtering material, simply a strainer for removing suspended sediments, conditions which can only be determined by analysis; conditions under which the filter would produce the two-fold result of simultaneous clarification and contamination. The somewhat generally accepted theory that limpidity means purity, being demonstrably illusive, as some of the clearest waters are notoriously the most impure; the outflow from a sewer, for instance, excepting in times of flood, and during flushing, cleansing, etc., is usually "crystal clear" while carrying in solution the most dangerous constituents.

The great difficulty and danger, therefore, in artificial filtration is due to the frequent necessity of thoroughly cleansing the filtering material.

It is both improper and far from my purpose, in the necessarily hasty preparation of this paper, either to portray the merits or to criticise the demerits of the several antecedent or present devices for artificial filtration. The older, and still the more extensive, systems having been designed by, and constructed under, the supervision of engineers of great experience and universally acknowledged ability—some of whose names are still among the most honored in the profession—while the more modern devices are generally covered by letters patent and ably represented by corporate associations. This has had the effect to largely transfer a troublesome problem from regular occasional engineering practice into a speciality, resulting in a wider range and more persistent thought, investigation and experiment.

Without intentional partisanship or discrimination, it may not be amiss to mention in this connection what is termed the "Hyatt Pure Water System," a system which is, doubtless, more or less familiarly known to most or all members of the association. It is claimed to possess the triple characteristics of coagulation, filtration, and aeration, using alum as a coagulant for the purpose of concentrating, solidifying, and rendering insoluble the more objectionable constituents in the water, which are afterwards arrested in the filtering material of sand, and comminuted coke, after which the filtered water is charged with atmospheric air under pressure, for the purpose of oxidizing and destroying the remaining organic impurities. The cleansing process consists in so manipulating valves as to force clear water through the material in reverse currents, raising, intermingling with, and passing rapidly through the filtering material, with the view of removing the coagulated impurities, by attrition and abrasion, and discharging them into outlet drain-pipes.

The use of this, or any other known or established system of artificial filtration in connection with water-works depending upon direct pumping or ordinary stand-pipe service, would necessitate a filtering capacity equal to the quantity of water required during fire service, or a storage capacity sufficient to meet such contingencies; otherwise the pipe distribution would at times be filled with unfiltered water—liable to prove not only objectionable, but also incur more or less expense and delay in blowing off and refilling with filtered water. In either case a low-service pump to supply the filter would doubtless be found a necessary adjunct, owing to the danger of subjecting a

large filter to fire-pressure, and the inefficiency of filtration under such extraordinary conditions, accelerated velocity, etc.

This subject may be regarded as an endless one, taking in its range an almost illimitable field of research, of experiment, of theory, and of empirical results; and while it seems safe to assume as one of the well-learned lessons of the past, that artificial filtration on a large scale has as a rule proven more or less unsatisfactory, owing to the intervention of apparently insurmountable obstacles, it may be equally unwise to assume that a result upon which the well being of so many municipalities is largely dependent can ever be attained.

In contemplating nature's grand system for supplying water so indispensably necessary to the comforts and needs of mankind, we are naturally impressed with the manifold phases which characterize the subject—evaporation, condensation, and descent as rainfall—constant and unceasing transition from pollution to purification and *vice versa*. Atmospheric pollutions begin to attack simultaneously with the commencement of its descent as rainfall, generally with soluble compounds, organic and inorganic. Terrestrial contaminations are carried from the surface into running streams. Subterranean constituents, harmful and otherwise, and of mineral, vegetable, and animal origin are taken in solution during its percolation into the earth—depending for the intensity of objectionable elements upon the degree of earth pollution. But in considering the question within the scope of this topic we have only to deal with the two former sources of contamination; and finally, the efficiency of subsidence as compared with filtration. Each is claimed as an assimilation of nature, and each requiring artificial attention when applied to the purification of a public water-supply. In the one case the sediments are arrested by filtering material, in the other, precipitated to the bottom of the subsiding reservoir. In the one case, if left to decompose, increased and irremediable pollution will follow; and in the other, equally deleterious results will characterize the decomposition into soluble gases, which, under the influence of capillary attraction and variable temperature, may again permeate and intermingle with the water until ultimately drawn to the surface and neutralized by atmospheric oxygen. In order, therefore, to properly and safely realize the purifying attributes of either system, both the arrested sediments in the filter and the precipitate in the subsiding reservoir should be thoroughly removed in advance of the possible commencement of decomposition.

Another point of more or less significance is found in the fact that, with ordinarily turbid water, successful filtration can be greatly augmented by preliminary subsidence.

On the other hand, and aside from the question of limpidity, the filter may prove an important adjunct to the subsiding reservoir.

The filter-bed equally intercepts and removes the fine vegetable fibres, and the minute organism, vegetable or animal, which in all river waters prevail more or less during certain of the summer months. The removal of this class of impurities is getting to be considered in England and elsewhere as of as much importance as the removal of the sedimentary uncleanness which is more apparent. During certain of the summer months, when the rivers usually carry but little sediment, this forms the chief beauty of the filter-beds. The surface of the sand becomes occasionally as much impeded with this matter as with the earthy sediments which more usually clog it, and it is of nature to taint the water under certain conditions more offensively than the other. The sand-filters are therefore considered very important instruments of purification in this relation. They become, indeed, screens of the greatest delicacy, intercepting all material impurities, not the least of which are the very small fish, with which all waters are crowded at certain seasons.*

A comparatively small, inexpensive filter, designed with single reference to the subservience of above purposes, would undoubtedly prove of great value where the supply is taken from open lakes or running streams, as the accumulation of "vegetable fibres and minute organisms," as mentioned by Mr. Kirkwood, is a fact which comes within the range of my own practice.

In view of the great and demonstrable benefits resulting from the prompt and frequent removal of precipitated sediments from subsiding reservoirs, and the well-known annoyance, expense and delay incident to cleaning them by former ordinary methods, I have adopted in recent practice a system of underdrainage, consisting of small openings placed in near proximity under the entire bottom area of the reservoir and connecting them with pipes (vitrified and cast-iron) converging to larger drainage mains, thence into drain-wells in the reservoir embankments; all of which are connected with a main conduit extending safely beyond the reservoirs into open drainage. By this process the entire bottom area of the reservoir can be simultaneously and frequently drained of the major portion of deposited sediments with no other manual labor or expense than the opening of ordinary valves; and during times of great turbidity and excessive sedimentary deposit, the drainage system can be left open, or sufficiently so to promote the constant outflow of precipitated impurities. By this process, also especially with some waters, the reservoir and its drainage system can be kept in simultaneous service—supplying clear water from and near the surface, while discharging turbid sedimentary water from the bottom; the several openings in the meantime creating downward currents proportionately accelerating precipitation, and at the same time securing the well-known bene-

fits due to agitation. In treating extraordinarily turbid waters, two, three or more subsiding reservoirs should be used, and made interchangeable in service, the water being passed from one to the other, and from the surface, either through pipes, or preferably over wide, shallow, overflow wires into a clear water chamber, thence through a thin stratum of filtering material to the pumps and into the general distribution.

I have thus endeavored to advert to the more salient characteristics of the two systems, without feeling called upon to champion the one or to detract from the other. Both may be said to have strong adherents, whose practice and opinions are well worthy of due consideration. For many years few, if any, material modifications were made or sought to be made in filtering devices, but within a comparatively recent period many inventive minds have been turned toward the discovery of various and much-needed improvements with the view and hope of meeting a long-felt necessity. Each and all of such inventions looking to greater safety, inefficiency and economy in this regard should receive the unprejudiced attention and faithful investigation of engineers, superintendents and others in charge of water-works enterprises.

Subsidence, too, although involving nature's great unerring principles, has, also, for many years been palpably defective in the detail of design, and proportionately unsatisfactory in current service. It is, however, demonstrably susceptible to improvements and added appliances which will insure perennial success and safety.

When viewed from any and every conceivable standpoint, this great subject is fraught with an importance second to none, if equalled by any of the almost countless questions with which you have to deal, during your incessant, perplexing and arduous home duties, or that can come within the purview of your joint deliberations.

RECORDING PRESSURE-GAUGES.*

The element of force or pressure in the development, transmission, and utilization of power or energy in the various industries and demands of the world is a very vital one; and the control and regulation therefore of pressure, to serve our purposes with the utmost economy and convenience, assures an importance which can only be appreciated by observing the enormous loss resulting from the spasmodic fluctuations very often noticeable in steam-pressures; not only as far as the effects of variable pressures are concerned, but equally in the direction of *waste* produced by the conditions necessary to cause the unsteady pressure. The main point in prosecuting any sort of enterprise is to know just what we are doing; as from that we can tell just what to do.

In operating steam plants, especially steam plants for pumping water for public supplies, economy in money is the factor to be looked to. By this it is not meant to be inferred that a narrow financial policy is to be advocated, but rather the idea that for any certain amount of total expense per annum, the greatest returns may be realized.

It must be an obvious proposition that to run a water-works plant to the utmost usefulness, a good cool head must know all about what is going on. Of course this proposition extends to various lines, but it is proposed to confine it in this paper to the consideration of pressures of both steam and water; the subject naturally dividing itself into these two parts.

A great deal of money that should appear upon the satisfactory side of the balance sheet, but does not, is absorbed by repairs and losses which need only to be traced to their cause to be prevented.

Disputes as to how quickly a fire-alarm was responded to, and "how high the pressure rose," are of frequent occurrence. The attendants at a pumping station, who know that a good recording-gauge is on guard in the office of the superintendent or chief engineer, are very certain to not only do their best, but also to take a pride in making a good record which cannot be disputed.

It occurs to the writer that a comparison of such records at these meetings would be conducive of improvement, and answer the inquiries as to why such a water-works does so much better than such others, and would induce that diving into matters which is the only way that a knowledge really worth anything is acquired.

The recording-gauge holds within its grasp an encyclopaedia of information concerning fuel, grate-bars, boilers, chimneys, dampers, steam-pipes, engine's suction-pipes, force-mains, fire service, hydraulic elevators, firemen, engines, superintendents, etc., etc.

First, with regard to recording-gauges as applied to steam-pressure. There are plenty of competent firemen ready and willing to attend to their duties, with whom it is an imperative condition that they be thoroughly acquainted with the demands made upon the boilers under their charge. Evidence in the shape of a continuous record of the results of a man's efforts, and the knowledge that this record is being reproduced completely outside of his power to manipulate, can have just one out of two effects either the man must give up his position or do what is required. In spite of all so-called automatic devices for securing uniformity in the performance of steam machinery, a steady steam-pressure in the boilers is more important than any single item involved. In a flouring or cotton mill, for example, an absolutely steady steam-pressure would enhance the value of the automatic cut-off engine, enable it to control the varying load with greater exactness, and produce a closer uniformity in the product.

* Abstract of a paper by J. D. Cook, C. E., read before the Convention of American Association of Water-Works at Minneapolis.

* J. P. Kirkwood.

* Abstract of a paper by Charles A. Hague, read before annual Convention of American Water-Works Association, Minneapolis, Minn., July, 1897.

If safety-valves are supposed to be set at any certain pressure, you can never tell whether they have been tampered with, or whether they failed to blow off when that pressure was exceeded, or how many times a day or night your boilers have been exposed to an excess of pressure. If a careless fireman keeps up his fires too strong toward "stopping time," or when the machinery is brought to rest, a good recording-gauge will completely expose such practice. One of the hardest kind of hard facts in boiler explosions is that they are mostly caused by *overpressure*, and overpressure, whether sudden or gradual, is nearly always caused by careless habits in working boilers. Firing is much easier work when properly understood and manipulated. The position of firemen may be considered an humble one by some folks, but let a fireman see that you care what he is doing and he will take a careful interest in his work. Let him understand that his own grading depends upon himself as established by his record, and let the recording-gauge be the arbitrator.

The mistake under which many people labor, that they need no such record as a recording-gauge will give, can be quickly corrected by a study of the charts which such an instrument produces. The items alone of steam running up above normal pressure and the inefficiency of safety-valves would be found to be very numerous if looked into. When the chart shows a greater pressure than it has been determined to carry, something is wrong that can be remedied. When the chart shows considerable periods of steam-pressure below an economical point, either the boiler or engine is not what it should be, or else the fireman is incompetent; in either event, money is going to waste that can be saved by a knowledge of the facts, and we would have no suspicion even of the deficiency without the record.

The consideration of the water-pressure, as shown by the recording-gauge, involves the performance of the pumping machinery. Of all steam machinery, a pumping engine to do its best must have uniform steam-pressure.

Water-works service in cities may be divided into two divisions—one in which the pressure in the mains is supposed to be constant, the other in which the pressure is held at a certain point for domestic supply, and increased in case of fire. In either case uniformity of water-pressure is to be desired. In gravity works, of course, the item of friction in pipes as set forth by the relation between the supply and demand is the principal disturbing element; a recording-gauge attached to the mains leading to any district will, in the course of a short time, show conclusively whether the pipes are large enough or not, or will locate any trouble in the shape of water-hammer or in the matter of obstruction to flow, from whatever cause.

There pumping machinery is depended upon in part or entirely, it is not too strong to say that a recording-gauge is well nigh indispensable, as fluctuations in pressure from any cause are faithfully portrayed; any failure in fire service giving rise to disputes as to pressure, time, etc., can be readily settled, as the chart shows the precise moment the pressure was increased in response to the alarm, and how long and steadily it was maintained.

Sometimes too many streams are attempted instead of a few good ones. The application of a recording-gauge at various points will soon determine the speediest and cheapest manner of remedying the difficulty. The presence of a water-hammer, caused perhaps by a dead-end or faulty circulation, will be indicated beyond mistake by the sharp and sudden raising of the tell-tale pencil. The writer has in mind a water-works system on the reservoir plan, under a pressure of about 120 pounds, where numerous house boilers commenced to give out that up to a certain day had seemed strong enough. After considerable damage had been done during two or three weeks, it was discovered that the trouble was caused by water-ram, the result of a connection having been made for water for locomotives, and the valve closed very quickly when the engine-tank was full. The application of an ordinary water-pressure gauge graduated up to 300 pounds developed the fact that the static head produced a pressure of 120 pounds at the point of draft. When the engine-tank was being filled through a wide open 6-inch valve, the pressure fell to 85 pounds, and when the valve was quickly closed, as it always was, the pressure ran up to considerably above the 300 limit of the gauge, and after five or six vibrations from just below 100 up to more than 300, the pressure gradually settled down to 120 again. A smaller pipe, an air-chamber and a safety-valve caused the trouble *after it was located*. A good recording-gauge would have rung an alarm and disclosed the excessive pressure the first time it occurred, saving many times its cost. Innumerable instances might be cited. The ordinary gauge drops away and then comes back to the normal pressure or raises and returns again to the regular point—but who sees it? It goes through the same fluctuations as the recording-gauge—but who can read it? With the recording-gauge this is graphically delineated upon a chart, divided off to suit the hours of the day, and even exhibiting when and for how long each sprinkling-cart was drawing water, the precise moment that a pipe burst, and how long before the fractured pipe was shut off from the system, and all irregularity in the operation of the machinery, etc., etc. As to the various kinds of recording-gauges before the public, the principal ones are: The Edson, made by James B. Edson, New York; the Ashcroft, made by the Ashcroft Manufacturing Company, of New York, and the Peerless, made by the American Steam-Gauge Company, of Boston. The Edson instrument is what is known as a diaphragm gauge, while the Ashcroft and Peerless are constructed upon the Bourdon bent-tube principle. The Bourdon instruments are actuated by tubes the same as a regular

steam-gauge, a small lead pencil being attached to an arm operated somewhat similar to the index of the gauge. The pencil traverses the paper ruled to represent hours, the line drawn by the pencil crossing the hour divisions at a distance from the starting point or zero indicating the pressure, so that the distances of the line from zero at any point between or at the hour lines indicates the pressure at that time. In the Bourdon instruments the charts are moved by clock-work, through a period of twelve hours. The Edson gauge is actuated by a corrugated diaphragm of tempered steel, which, by a peculiar and ingenious mechanism, makes a pencil exactly vertical, and, at the same time, sweeps a regular gauge pointer or index through the arc of a circle graduated to show the pounds pressure per square inch. The spring arm carrying the pencil keeps the point at all times against the paper, while appropriate clock-work moves the paper from left to right to correspond with the hours of the day or night during a period of twenty-four hours. One peculiarity of the Edson gauge, outside of its twenty-four hour clock record, is that the pressure upon its steel diaphragm on one hand, and the resistance of the diaphragm itself on the other, contribute to very great steadiness and certainty of motion, as the work thus done is so greatly in excess of any effort required to move the recording mechanism that the instrument is practically frictionless, the steadiness of its pencil line attesting the value of this feature, even on variations of the pressure to the slightest degree. It also has an alarm operated by the clock through the medium of an adjusting screw, set so as to ring a small gong in the instrument at any determined pressure required. In closing, it may be of interest in connection with this subject to note Mr. Edson's successful efforts to secure four test-gauges graduated up to 300 pounds per square inch. He constructed a mercury column of $\frac{1}{4}$ -inch heavy, hydraulic, wrought-iron pipe at one of the piers of the Brooklyn bridge—then in course of construction—in 1872. The column was carried up to an elevation of 265 feet above the point of observation, it being necessary to carry the pipe up on to the derrick—then at the top of the pier—to get the desired elevation. The manner of dividing the columns, so as to define the different elevations of mercury exactly, was peculiar, and consisted in laying off the pipe with a standard steel scale, and every ten feet a hole one-sixteenth of an inch in diameter was drilled and plugged. Days of the same temperature were selected for the experiments after the column was filled with pure mercury. The levels were obtained by withdrawing the plugs, beginning at the top of the column and letting the mercury escape down to each 10-foot level successively. The indications were recorded upon four gauges made with plain, free Bourdon tubes, selected for the purpose, and with 10-inch dials. This mercury column was the highest ever put up in this country, and probably in the world. The gauges being used only as master gauges are probably as good to-day as when made. These are matters pertaining to the uses to which recording-gauge charts may be put in connection with steam-boilers, the regulation of the fires and economy of fuel in the fire-room which, although not exactly foreign to the subject, would extend this paper beyond a judicious limit. The opportunity may arise for a further extension of the questions involved at some future time.

THE FLORIDA HEALTH PROTECTIVE ASSOCIATION.

UNDER the above title the several county boards of Health have formed an organization for the purpose of perfecting a system of quarantine. The convention for this purpose was called by the Duval County Board of Health. The object in view is a highly commendable one, being to secure uniformity of action, and to remove unnecessary restrictions on commerce by doing away with the so-called interior quarantines, first taking care that effective systems of inspection are established at those points having direct communication with Havana and Key West. Dr. King Wyly, of Orange County, was elected President, and it is provided that the expenses incurred in carrying out the orders of the association shall be met by the several counties *pro rata* according to their assessed valuation.

It is to be hoped that this will lead to a regularly organized State Board of Health with authority and means to do what is required.

DR. EDWARD S. WOOD, of the Chemical Laboratory of Harvard Medical College, has recently sent to Colonel H. T. Rockwell, Chairman of the Boston Water Board, a report on the July analyses of the waters supplied to the city. The principal inferences to be drawn from the analyses are, he says, that the waters of Basins 1 and 3 are about the same condition as in July of last year, but better than in July, 1885. The water of Lake Cochituate is in excellent condition, and that in Basin 4 is very much improved since last October, and is now in very fair condition. Considering the fact that Basin 4 is a comparatively new one, the water is in excellent condition. Both conduits are clean and exert only a beneficial effect. The water at the source in Boylston Street was in good condition also.

HOUSE-DRAINAGE REGULATIONS AT HAVERHILL, MASS.

THE Board of Health of the city of Haverhill, Mass., have lately drawn up a proposed ordinance and presented it to the City Council to be adopted by them to license plumbers and regulate the character of the work to be done by these mechanics. Like similar regulations now in force in many other cities, this code prescribes that all plumbing-work shall be done according to approved methods. Whenever sewers are provided in the streets the abutters are to be obliged to connect their house-drains to them and abandon the use of cesspools and vaults. The usual rules are introduced concerning the use of metal pipes for all soil-pipes and waste-pipes within the house-walls, with proper connections between lead and iron wastes.

Though the general requirements of this code are excellent, corresponding with what has always been advocated in these columns as good practice, some of the details are apparently of questionable propriety—viz.: All water-closets not having windows opening directly to the outer air are required to be ventilated by an "air-shaft up to or above the roof, having an area of not less than three square feet, with an opening to the external air of an equal area. This opening at the top of the air-shaft can be arranged by extending the shaft above the roof and providing a sash of an area equal to that of the shaft, which can be controlled by a cord and pulley from below." Such an arrangement when under intelligent control might give good results for such parts of the year as would yield an upward draft of air in such a shaft from natural causes. But there would be inevitably a period, nearly half the year, when the weather would not create such an upward draft, or when a downward draft would be too cold in our climate to be free from frost.

At such times the shaft could not be left open long without danger of freezing the water-supply, and the result would, in most cases, be that the shaft would rarely be opened except in warm weather. Now it is during the winter months that the interiors of all houses suffer most for lack of ventilation, and when the ventilation of water-closets becomes for this reason of more importance than at any other time. The only effectual means to produce a good result in closets not provided with windows directly to the open air, is to provide a small duct to the open air, through a heated flue, or to heat the duct itself by a gas-burner or hand-lamp. The duct may not be larger than three or four inches in diameter, and may be of zinc or tin or galvanized iron, with an opening under or near the seat of the water-closet for taking air. If connected to a hot flue of a chimney, such ducts should extend quite to the top of such chimney, and where inclosed in the chimney-stack should be of cast-iron or terra-cotta, for tin or any sheet metal in such a position would soon perish.

It is required by these regulations that all "water-closets above the first story of a building must be supplied from a tank, which must not hold less than eight gallons of water for each water-closet," etc. We do not see the propriety of excepting the closets on the first floor from the requirement of a tank, but think that eight gallons is a rather unnecessarily large size for a tank which supplies only a single closet; five gallons is ample in private houses.

In specifying the size of vent-pipes for wastes, the word "ample" is not definite enough. They should always be as large as the wastes to which they are applied.

In providing for foot-ventilation and access to the running trap on the main drain, it is often more convenient to combine the two, and better for other reasons also, by placing the trap in a manhole outside the house, with air-pipe to the curb-stone. The handhole can, in such case, be always left open as an air-inlet.

These regulations leave the trap on the main drain optional when connected with sewers. It is our opinion that a trap on the main drain can be very seldom omitted with safety, and certainly not in a city where the sewers are not fully up to the highest standard as to cleanness and ventilation. We judge that the regulations of Haverhill are not of this high character by

the report of the Board of Health, pages 6 and 7, where reference is made to the very foul emanations from untrapped catch-basins and the need of ventilating man-holes.

These regulations do not include any test for the tightness of newly-constructed house-drains and soil-pipes. In our opinion such a test is of even more importance than in case of the pipes for distributing gas, for the escape of illuminating gas always betrays itself quickly, while leaks in joints of soil-pipes often go unnoticed and unknown till much harm is done. The limit of distance (fifty feet) between a porous cesspool and a well may be quite insufficient in porous soils. Too much caution can hardly be exercised in this question.

With the above suggestions as to minor details, we commend the regulations to the citizens of Haverhill as a step in advance in the matter of municipal government. We notice that in discussing the subject in the City Council they are spoken of as needlessly long and cumbrous. We do not see how they could well be shortened, unless their execution be left entirely at the discretion of the officials, who are not apt to be men of such full information on such subjects as to be able to dispense with such detailed rules as are here proposed. Unless the City Council wishes to show itself to be more than usually indifferent to the welfare of the citizens, they will not fail to put the plumbers under the restraint of a license, and regulate their work by some such code as is here suggested. Honest plumbers will favor such a course, for ignorance and dishonesty always thrive most where no such ordinances exist.

OFFICE OF BOARD OF HEALTH, }
HAVERHILL, MASS., July 7. 1887. }

SIR: We forward herewith a draft of a proposed ordinance relating to house-drainage and plumbing of new buildings in this city which the board has had presented to the City Council to be adopted as an ordinance of the city, together with copies of local newspapers showing the action taken thereon by the lower branch of the City Council.

The board would be greatly obliged for a criticism or any suggestion you may have to offer in reference thereto.

Respectfully yours, CHAS. BRYANT, Clerk.

ORDINANCE FOR THE REGULATION OF PLUMBING, HOUSE-DRAINAGE AND PRIVY-VAULTS OF THE CITY OF HAVERHILL.

SECTION 1. No person shall carry on the business of plumbing unless he shall have first obtained a license and registered his name and place of business in the office of the City Clerk, and notice of any change in place of business of a registered plumber must be given within ten days to said City Clerk.

SEC. 2. Before proceeding to lay, construct or reconstruct any portion of the drainage system of any building, the plumber having charge of the same shall, except in the case of leaks, file with the Board of Health plans and specifications of the whole drainage system, including branches, ventilating pipes, traps, etc., and in case of a privy-vault, a description thereof, giving its position relative to the house and limits of the lot, its size, construction and ventilation; and no person shall commence any portion of such work until the description thereof shall have been approved by the Board of Health, and after such approval there shall be no alterations unless likewise approved. Blank specifications will be furnished to architects, plumbers and others on application at the office of the Board of Health.

SEC. 3. The Board of Health shall be promptly notified in writing when the plumbing-work on any house is completed or sufficiently advanced for inspection; and no part of the plumbing-work of any building shall be covered or in any manner hidden from view until after an inspection has been made, and certificate of approval issued, by the Board of Health or its agent.

MATERIALS.

SEC. 4. Every soil, drain, waste or ventilating pipe above ground, and inside or under the building, shall be of metal. Soil-pipes shall be of iron, sound, free from sandholes, of a uniform thickness and of not less than four inches in diameter; and waste-pipes shall be of iron or lead. The portion of the main drain, within the house-walls and within four feet of the inside face of the cellar-wall, shall be of iron, and shall pass through the wall two inches clear of the masonry on the top and both sides, to avoid injury by settlement. Beyond this point it shall be of "extra heavy" iron pipe, cement or vitrified earthen pipe of suitable size, with a fall of at least one-quarter inch to the foot, unless otherwise permitted.

JOINTS.

SEC. 5. Joints in iron pipes shall be either screw, oakum-packed and lead calked, or carefully and properly made rust-joints; and joints of lead pipe shall be, where practicable and possible, of wiped solder. Joints in cement or earthen pipe shall be made water-tight by means of hy-

draulic cement mortar, and care must be taken that no mortar is left at the joint inside the pipe; and joints of lead with iron pipes shall be made with a brass sleeves or ferrule, joined with the lead pipe with a wiped solder joint, and calked with lead in the iron hub.

CONNECTIONS.

SEC. 6. Connections of branch wastes with the main drain, soil or other waste pipes shall be made so as to change the direction of the flow as smoothly as possible, and when cast fittings are used connections shall be made by means of Y-branches and $\frac{1}{8}$ -bends, except on vertical waste or soil stacks.

WATER-CLOSETS.

SEC. 7. No water-closet shall be set up in any room or apartment that has not a window having an area of at least three square feet opening directly to the external air; they will, however, be permitted in rooms or apartments having no windows communicating directly with the external air, providing that there is an air-shaft extending up to or above the roof, having an area of not less than three square feet, with an opening to the external air of an equal area; this opening at the top of the air-shaft can be arranged by extending the shaft above the roof, and providing a sash of an area equal to that of the shaft, which can be controlled by cord and pulley from below. All water-closets shall be furnished with a sufficient supply of water to keep them at all times clean and well flushed, and water-closets located above the first story of a building must be supplied from a tank, which must not hold less than eight gallons of water for each water-closet which it supplies.

TRAPS AND FRESH-AIR INLET.

SEC. 8. Each fixture shall have an effectual trap close to it—the distance not to exceed two feet—and which, if of a kind and in a position liable to be syphoned, shall be protected therefrom by a properly constructed vent of ample size. As exception, the use of a single trap may be permitted for one set of wash-trays or two adjoining fixtures, consisting of wash-bowls or bath-tubs. In no case shall the waste-pipe from a bath-tub or other fixture be connected with a water-closet trap; nor shall traps be placed on or at the foot of vertical soil-pipes. A running or $\frac{1}{2}$ -S trap shall be placed on the house-drain at an accessible point near the front of the house. This trap must be furnished with a hand-hole for convenience in cleaning, the cover of which must be properly fitted and made gas and air tight. There shall be an inlet for fresh air entering the drain just inside this trap, of at least four inches in diameter, leading to the outer air and opening at or near the street curb, and remote from windows or cold-air boxes. Where, however, the main drain is connected with a common sewer, trapping the main drain shall be optional with builders; but in all cases where the main drain is trapped the fresh-air inlet, as provided in this section, shall enter said drain.

SAFES, OVERFLOWS, REFRIGERATORS.

SEC. 9. Waste-pipes from safes and refrigerators and overflow tanks or cisterns shall empty over sink, trapped gulley or otherwise, as may be approved, but shall not connect directly with the drainage system.

CONDUCTORS.

SEC. 10. Rain-water leaders shall not be used as soil, waste, or vent pipes, nor shall any soil, waste, or vent pipe be used as a leader. When within the house, the rain-leader must of cast-iron with leaded joints; when outside of the house, and connected with the house drain or common sewer, it must be trapped beneath the ground or just inside of the wall, the trap being arranged in either case so as to prevent freezing. In every case where a leader opens near a window or a light-shaft, it must be properly trapped at its base.

VENTILATION.

SEC. 11. Soil-pipes shall be continued full bore up through the roof, without return bend, in as direct a line as possible, terminating at least two feet above any window or opening into the building. All branches of ten feet or more in length shall be continued at full size through the roof, or be taken into the soil-pipes above the highest fixture, unless otherwise permitted by the Board of Health. Any branch less than four inches in diameter to be carried through the roof, shall, four feet before pass-

ARRANGEMENT.

SEC. 12. Soil, drain, waste, and ventilating pipes shall be concentrated as much as possible, and, on the completion of the work, shall be left readily accessible, and in view as much as possible. (It is recommended that the drain, soil, waste, and ventilating pipes and the traps be exposed to view for ready inspection at all times and for convenience in repairing. When necessarily placed within partitions or recesses in walls, soil and waste pipes should be covered with wood-work so fastened with screws as to be readily removed. In no case should they be absolutely inaccessible.) Any house-drain put in and covered over without due notice to the Board of Health must be uncovered for inspection at the direction of its agent or inspector.

WORKMANSHIP.

SEC. 13. The whole drainage and plumbing work of buildings shall be executed by skilled mechanics in a thorough and workmanlike manner.

PRIVY-VAULTS.

SEC. 14. Privy-vaults shall be built of smooth, hard-burned bricks laid with hydraulic cement-mortar and with walls of solid masonry eight inches thick. The whole interior surface shall be coated with cement-mortar, and shall be ventilated in such a manner as not to annoy occupants of neighboring buildings.

PRIVIES.

SEC. 15. No privy shall open directly from any living or food-storage room.

PRIVY-VAULT VENTILATORS.

SEC. 16. No brick, steel-metal or earthenware flue shall be used inside of any building to ventilate any privy-vault, cesspool, trap, drain, waste, or soil pipe, and chimney-flues shall not be used as such ventilators.

CESSPOOLS.

SEC. 17. Cesspools shall be built in a thorough and substantial manner and shall be properly vented. Should the cesspool be located within twenty feet from the cellar, or fifty feet from a well or other source of water-supply, which is used for culinary purposes, it shall be made absolutely water-tight.

SEC. 18. No opening shall be provided in the sewer-pipe of any building for the purpose of receiving the surface drainage of the cellar, unless special permission is granted by the Board of Health, and any opening so made shall be immediately and permanently closed when directed by the Board of Health.

SEC. 19. Subsoil drains shall be provided whenever dampness of site of any building is known to exist.

SEC. 20. On every street provided with a common sewer the sewage from each building shall be conducted into the common sewer, and no privy-vault or cesspool will be permitted upon any premises situated on such street, unless upon permission of the Board of Health in writing. All buildings located on such streets must be provided with water-closets either in the house or yard.

SEC. 21. All drains now built shall be reconstructed whenever, in the opinion of the Board of Health, it may be necessary.

SEC. 22. The provisions of sections 4 to 12, inclusive, of this ordinance shall apply only to buildings erected or to work performed after its passage.

RASCALLY PLUMBING IN NEW YORK CITY EXPOSED BY THE BOARD OF HEALTH.

ON June 10, in the Court of Special Sessions, P. S. Halpin, plumber, of 277 Third Avenue, New York, was prosecuted by the Board of Health on two charges of gross violations of the plumbing and sanitary laws of the city, and convicted and fined in both cases, the fines aggregating \$450.

In the case of four private houses of special design, by James E. Ware, architect, on the north side of Ninety-seventh Street, 225 feet west of Eighth Avenue, of which R. B. Disbrow is owner and builder, he pleaded guilty to

ing through, be enlarged to not less than four inches, and terminate not less than two feet above the roof and remote from windows or openings into the building. Ventilation-pipes shall be of not less than two inches diameter for distances of thirty feet or less, and of not less than three inches for distances of more than thirty feet.

the cellar-drain not being trapped properly; the fresh-air inlets being clogged and out of alignment; no proper alignment to the cellar-drain, three inches only of fall being provided on the length of the house; hubs open and badly calked and poor work generally, as testified to by the inspectors of the Health Department.

In this case he pleaded guilty, as before mentioned, throwing the blame on a deceased partner in business and on his employees, and, in consideration, was let off with a fine of \$200. The inspector was C. A. Hollick.

In the second case the house was by the same owner and builder, at One Hundred and First Street, seventy-five feet east of Ninth Avenue. It was a tenement-house for eleven families, from designs by A. B. Ogden & Co., architects, just built, and four families had moved in.

In this case the plumber (P. S. Halpin) pleaded not guilty, but the evidence of the Chief Inspector of the Health Department, Mr. John C. Collins, and his assistant, W. H. Titus, developed the following facts: Vent-trap at basement sink was a dummy (as shown in Fig. 1). It was run under the floor, where it stopped, and was closed and soldered at the end, and was clearly arranged to deceive the inspector; the hub into which the sink pipe entered was badly split; the other hub of the same Y was closed with a brickbat and some mortar. Open joints were found in other parts of the house by the permit test.

Mr. A. L. Whitelaw, master plumber, of 391 Fourth Avenue, who was engaged to remedy the defects and perfect the job, also discovered that 8 feet of the house-drain outside the house-trap was missing. This is plainly shown in the diagram Fig. 1. The house-sewer was of 6-inch earthenware pipe, run to the area wall. The house-drain was of 6-inch cast iron to the front area of the building, but the space intervening through the area was not excavated and no pipe was laid in it, the sewage forcing itself through the ground in the cellar. The plumber was convicted on this charge and fined \$250, and would probably have been sent to jail were it not that he again blamed his deceased partner and claimed that he was not morally responsible, not knowing the actual condition of affairs. The tenement had been sold to a Mr. Johnston.

James Barry was arrested for doing bad plumbing in twelve houses, west side of Ninth Avenue, between One Hundred and Fifth and One Hundred and Sixth Streets, New York City.

The owner of these houses was Lawrence Weiher, of New Rochelle.

There were split house-drains and pipes in Nos. 1841, 1851, and 1853, and the owner would not remove them when requested by the department. They were puttied and

painted to deceive the inspector, and the plumbing was poor generally. In No. 1853 there was little or no "pitch" to the house-drain, and the fresh-air inlets were defective in being low at the outer elbows, so they filled with condensation or from water that would run over by a stoppage of the trap. Fig. 2 shows how this was done.

MORE DUMMY VENTS.

H. Z. Norton, plumber, was arrested June 2, for dummy vents put in three or four years ago.

At that time he did the plumbing of twelve houses on the east side of Madison Avenue, between One Hundred and Twentieth and One Hundred and Twenty-first Streets. He was then arrested, and fined \$50 in the Court of Special Sessions, and his plea was, "his workmen imposed upon him," and he made a show of making all right. Now, however, in Nos. 1851 and 1855, three dummy vents have been discovered in each house during the overhauling of the houses, and he is arrested again, but his case has not yet been brought to trial. The vents of the basin-traps were carried through the floors, and there stopped. Mr. Louis M. Hopper was the inspector.

Gas and Electricity.

Illuminating Power of Gas in New York City.

E. G. LOVE, Ph.D., Gas Examiner.

THE Board of Electrical Control, of New York City, met on July 15 and adopted the following rules governing the erection of telegraph and telephone poles and wires. At a subsequent meeting this action was reconsidered, and the rules have been referred to an electrical expert for examination and report. The rules have been approved by General Newton, Commissioner of Public Works:

No two lines of poles shall be on the same side of any street or avenue.

No two lines of poles bearing conductors for similar electrical service shall be on any street or avenue.

Electric-light poles shall be of iron, at least 25 feet in height, with a diameter of not more than eight inches at the base, and having cross arms of wood, with glass, porcelain, or rubber insulators, and painted a uniform color.

Poles for telegraph, telephone, and other similar wires shall be at least 60 feet in height.

Poles shall be placed upon the sidewalk, as near the curb as possible, and no pole shall be placed within 10 feet of any lamp-post or other pole.

All existing regulations of the local authorities in regard to the placing of poles and stringing of wires are to continue in force.

All wires shall be fastened upon poles or other fixtures with glass, porcelain, or rubber insulation.

No wires shall be stretched within one foot of any pole without being attached to the same with glass, porcelain, or rubber insulation. No wires shall be stretched within 20 feet of the ground or within four feet of any building, except when attached thereto with glass, rubber, or porcelain insulation.

No arc electric-light or power wires shall be stretched over any part of any house or other building.

The companies or persons owning or controlling poles in any street or avenue shall allow the same to be used by other companies or persons operating conductors for similar electrical service when authorized so to do by the board on tender of proper compensation, to be determined by agreement between the companies or persons interested. In default of such agreement, the amount of such compensation shall be determined by the board. This rule imposes a contract on the part of each company or person owning or controlling the poles in any street or avenue, not only with the board, but also with each company or person who shall under its terms be qualified to demand the privileges it confers.

All permits of the board for overhead wires and fixtures are granted only pending the providing of underground accommodations in the neighborhood of the street or avenue for which the permit is granted.

Any member or officer of the board, and every inspector employed by it, as well as every member of the police force of the city, shall be entitled to examine permits under which work of any kind is being done.

No permit shall be granted for the erection of any overhead structure, nor for the renewing of any lines already existing in any street, avenue or highway in which underground accommodations for the service have been provided or are being provided.

All poles now standing, or to be hereafter erected, shall be branded or stamped with the initials of the company owning them, at a point not less than five or more than seven feet from the street surface.

When an old pole is taken down, it must be removed from the street the same day.

New poles must not be brought upon any street more than two days in advance of their erection.

Any pole that shall be on the street more than two days shall be removed by the Bureau of Incumbrances of the Department of Public Works at the expense of the party owning it.

All electrical companies or persons having poles in the public streets shall give a bond to the city, in a reasonable amount, to be determined in each case by the board, conditioned for the payment of the cost of renewing dangerous and abandoned poles, and also for the payment of the expense of restoring the sidewalks and pavements where the same have been disturbed or injured in consequence of the erection or removal of any poles owned by them.

The violation of any of the rules and regulations of the board shall operate *ipso facto* as a revocation of the permit held by the company or person guilty of such violation.

The Chief Engineer was ordered to report the present condition of pole and wires and to suggest any necessary change. He was also empowered to nominate one Chief Inspector at a salary of \$250 per month, and eight inspectors at \$4 per day.

Chief Engineer Kearney submitted plans for the digging of conduits, which, he believed, could be dug at from three to seven feet from the curb. The question came up of whether the gas-pipes laid in the streets could be removed as obstructions to the underground work; legal advice is to be obtained. Gen. Averill said that it was his opinion that iron pipes laid in hydraulic cement rotted in a very short time. He wrote to the Superintendent of Public Buildings in Chicago, who had had some pipe removed from that sort of cement in a building in that city. The answer was that the pipe had to be removed because it had corroded and had become so rotten in places that it crumbled. Engineer Kearney said he considered hydraulic

cement better than any other material for the purpose; the anchorages to the Brooklyn Bridge and the Suspension Bridge at Niagara were laid in it. A recent examination showed them to be in excellent condition. It was decided to consult Mr. McNulty, one of the engineers of the Brooklyn Bridge, as to his opinion on the subject.

Novelties.

PRESSURE-REGULATOR.

THE accompanying cut shows a novel modification of pressure-regulator for fluids, and is the invention of Joseph E. Watts, of Lawrence, Mass.

The invention consists in the general arrangement and method of operating the main valve, which is a "balanced" valve, so called, whereby the movement of the latter is effected more gradually and the low-pressure system is not subjected to such extreme fluctuations as usually occur where the main valve is not balanced; in boring the main valve in such manner that the rear side of the valve, when the latter is closed, shall be subjected to the initial or high pressure in contradistinction to valves employed in regulators of this class, in which the rear side of the main valve is connected with and open to the low-pressure system when the said valve is closed. The drawings represent in Fig. 1 a plan, and Fig. 2 a central vertical section. It belongs to that class in which a weighted pulsating diaphragm operated by the variations in the low-pressure system serves to control a secondary valve, which in its turn regulates the movement of the main valve to admit or shut off steam under initial pressure, such opening and closing of the main valve being accompanied by an increase or diminution of the pressure in the low system to maintain the latter uniform and somewhat less than that of the said initial pressure.

A represents the exterior casing of the valve as an entirety, which is hollow and centrally provided with a "plunger-balanced" valve, B, so called, which reciprocates

ates through the internal division-wall, and controls the passage and regulates the supply between the inlet-passage C and the discharge D. The upper end of the main valve extends into a tubular cap, E, which incloses the actuating-spring δ . The main valve B is bored at c, as shown, by which a duct is formed leading to a closed chamber, F, normally open to and under the initial pressure. The lower part of the chamber F is furnished with a port, d, controlled by a secondary valve, G. The latter is connected by the valve-stem e with a pulsating diaphragm, H, which controls this secondary valve and forms the bottom of a hollow well, f, to be filled with water from the condensed steam, to prevent sudden jumping or resilient action of the diaphragm.

The reduction or difference in pressure between the initial supply and low-pressure system is effected by means of a weighted lever, g, and by the adjustment of the weights thereon the action of the diaphragm is controlled and regulated.

SPECIAL REPORT OF THE CHICAGO DRAINAGE AND WATER-SUPPLY COMMISSION.

Messrs. RUDOLPH HERRING, Chief Engineer, Benesette Williams and S. G. Artingstall, Consulting Engineers, as the Drainage and Water-Supply Commission of Chicago, have made a special report on the "Diversion of the Flood-Waters of the Desplaines River and North Branch of the Chicago River," and on improving the condition of the South Fork, from which the following is abstracted:

As a part of the final project to dispose of the Chicago sewage into the Illinois River, it was recommended that hereafter no flood-water should pass into the lake through the Chicago River, and thus periodically endanger the water-supply. This flood-water, which comes partly from the North Branch, and partly from the Desplaines River through the Ogden-Wentworth ditch, can be otherwise disposed of. Sufficient capacity can be provided for it in the proposed channel to the Illinois River, or it can be diverted into Lake Michigan before it becomes polluted by its passage through the city. The latter disposition is advised.

The commission after citing at length the reasons for the position taken in the report then proceeds:

As the bill authorizing the Desplaines and North Branch diversion has now become a law, it is deemed important to proceed with the execution of the work at the earliest possible moment, because the territory through which the proposed channel is carried is rapidly building up, and the property is increasing in value.

The diversion can be accomplished along various routes, each with some specific advantages.

The fact that the North Branch lies between the Desplaines River and the lake makes it evident that the Desplaines will first have to be turned into the North Branch and subsequently the combined waters of the two streams carried into the lake. The most practicable point at which to divert the Desplaines is immediately north of the town line, between Leyden and Maine. The distance along this line is the shortest, and the excavation and damage to property the least.

From the North Branch to the lake the two lines which are considered most feasible are as follows: One extending from near the north line of Niles township to the lake near Winnetka; the other from Bowmanville eastward through Lake View to Lake Michigan.

Preference has been given to the latter route.

Then follows a description of the diversion channel, from which the following is abstracted:

As a result of the investigation it has been concluded that the channel from the Desplaines to the North Branch should be given a capacity of 10,000 feet per second, with a mean velocity of five feet, or a section of 2,500 square feet, and the channel from Norwood Park to Lake Michigan a capacity of 12,000 cubic feet per second, the section from Bowmanville to the lake to be 21 feet in width and 18 feet in depth below the city datum. The distance from the Desplaines to the lake is 11 1/2 miles.

Norwood Channel.—The channel of diversion will slant at the Desplaines River, three and three-fourth miles by the course of the river below the village of Desplaines and at the first easterly bend above the south line of the town of Maine, in Section 34.

The centre line of the channel will continue the course of the river above this bend by an easy curve to a line parallel to and 200 feet north of the township line between Maine and Niles on the north and Leyden and Norwood Park on the south, until the valley of the North Branch is reached at a distance of 10,400 feet, or three and seven-tenths miles. A strip 100 feet wide and bounded by the township line on the south will be required for right of way.

The proposed channel of diversion is designed to carry 10,000 cubic feet per second from the Desplaines without sensibly altering the height due to a flood of that volume. This channel will conduct floods of any other height without materially changing their level. Ordinary floods are less than that of 1887 and do not reach a damaging height.

The velocity in great and unusual floods will be five feet per second, giving a cross-section of 2,000 feet. An economical section for this channel will have a depth of 16 feet, a bottom width of 100 feet, and side slopes of three horizontal to two vertical. The width at the flood-line will be 143 feet. The maximum depth of cut at the summit will be 57 feet, or 40 feet above the flood-line, and the greatest width will be 271 feet. The flow-line will lie sufficiently below the general level of the prairie and the bluff level of the Desplaines at the west end. It will lie above the prairie level for about 2,000 feet at the east end, where it will be retained by broad levees of from one to seven feet in height. This will not interfere with the natural drainage of the prairies.

The Desplaines River dam will be simply an embankment raised to an elevation of 55 feet above datum, or five feet above high water of 1881. In fact the immediate valley can be entirely filled as far as the Higgins Road, about three-fourths mile below. The flanks of the valley may also be filled above so as to narrow the present overflow area without impairing the hydraulic condition.

North Branch Channel.—The length of the first reach from the weir west of Milwaukee Avenue to the proposed location of the weir in the North Branch will be 7,100 feet, or one and one-third miles.

The crest of the weir will be set at 10 feet above datum and will be 200 feet long. The depth of the water flowing in over it will be seven feet, or 12,000 feet per second.

It is proposed to excavate a section with a bottom width of 150 feet to a depth of 12 feet below the flow-line and on a grade parallel thereto.

The route for this excavation is a centre line of a belt 400 feet wide, shown on the map, which belt represents fairly the available width of the valley. Generally the cut will be shallow.

The second reach extends from the east line of section five to a point one-fourth mile west of Western Avenue at Bowmanville, a distance of 23,750 feet, or four and three-eighths miles. The route follows the bed of the stream to the Bowmanville Bridge, thence easterly one-fourth mile north of Lawrence Avenue.

Bowmanville Channel.—The section from Bowmanville to Lake Michigan begins one-fourth mile west of Western Avenue on the north and continues in a straight line one-fourth mile north of Lawrence Avenue to 500 feet beyond the shore-line of the lake, 12,000 feet, or two and one-third miles.

The right of way will extend from the south line of Webster Avenue on the north to the north line of Tuttle Street on the south, and be generally 500 feet wide south from the east and west line of Webster Avenue.

It is proposed to dredge and dock a channel 210 feet wide and 13 feet deep below city datum. The cutting for about one-third the distance will be less than ten feet above datum, for another third from fourteen to eighteen feet, and at the highest point, on the Green Bay Road, twenty-five feet. The cut will require side slopes and a berme at dock-level. A considerable portion of the material above datum will be sand or soil. The balance of the cutting will probably be in clay.

At the lake end a pier will extend 300 feet on the north side and two, three or four feet deep depth of water on the south. These piers are not intended to reach a navigable depth.

From the main channel, one-fourth mile west of Western Avenue, it is proposed to make a single dredge-cut or initial channel southward along the North Branch. The course will be one-fourth mile west of Western Avenue to Graceland Road, and thence general course of river to Belmont Avenue. A strip one-eighth mile wide for right of way should be reserved.

To entirely prevent the water of the Desplaines from entering Chicago River by the Ogden-Wentworth ditch will require a dam and levee nearly one mile long across the head of Mud Lake Valley, near Summit.

The total estimated cost is \$2,695,617.

Discussing the subject of the improvement of the South Fork the report says:

The project of drainage via the Desplaines River, recommended by this Commission in the preliminary report, involves the extension of the western end of the South Fork in a westerly and northerly direc-

tion to the Ogden-Wentworth ditch, and thence to the Summit. For the immediate amelioration of the condition of the South Fork until the final completion of the main canal, it was also recommended that the western arm of the South Fork be extended along its proposed permanent line to the Illinois and Michigan Canal, where a new pumping station was to be built.

As there is nothing temporary in this plan except the pumping works, and as further consideration of the question confirms this commission in its previous conclusion, the recommendation is repeated that the western arm of the South Fork be extended along the most practicable route to a point on the canal north of Thirty-ninth Street and west of the Chicago and Grand Trunk Railroad, and that pumping works will be built near the canal with a total capacity of 45,000 cubic feet per minute.

There are no improvements on the proposed line. The channel will be 10,500 feet, or two miles in length, and should be excavated to an average depth of thirteen feet below datum, and sixteen feet on the bottom, with side slopes one and one-half horizontal to one vertical. Such a channel will carry 30,000 cubic feet of water per minute with no greater velocity than that existing in the Illinois and Michigan Canal. By selling permits to brickmakers, this channel can be widened and deepened in a few years to any desired extent and a revenue derived therefrom in the meantime.

To keep the eastern arm of the South Fork in a sanitary condition, it will be necessary to build an intercepting sewer along its south side from Halsted Street to a point on the west arm, so that all sewage will be discharged into the current established by the pumps.

The cost of improving the South Fork as herein recommended is estimated at \$653,000.

In conclusion the report reads:

With the present powers of the city of Chicago and the town of Lake and the concurrence of the Canal Commissioners, it is practicable to carry out the work proposed in this report. With the diversion of the Desplaines and North Branch, the construction of a dam across the Desplaines Valley at Summit, and the improvement of the South Fork as recommended, Chicago will have much greater immunity from contamination than at present, while the sanitary condition of the Chicago River will be better than it has been for many years and the navigation of the Illinois and Michigan canal will be improved. The total expense of this work is estimated at \$3,348,617 and the time in which it can be completed at two years.

INSPECTORS OF PLUMBING, TORONTO, ONT.

THE first examination of candidates for the position of Inspector of Plumbing, under the lately enacted plumbing by-law, was held on the 6th and 7th inst. in the City Hall. There were eight candidates. The examiners were the City Engineer, the Medical Health Officer, Mr. S. G. Curry, architect for the Toronto Sanitary Association, and Messrs. I. Ritchie, Sr., and W. I. McGuire, for the Master Plumbers' Association. The examinations were all written; no orals were given. The inspectors will be attached to the Water-Works Department. It is intended to appoint only one for the present. He will have plenty to do.

LEAD-POISONING IN DYE-WORKS AND ITS PREVENTION.

IN a recent number of the *Glasgow Medical Journal* Dr. Alexander Scott describes a number of cases of chronic lead-poisoning occurring in a large dye-works where chromates of lead are much used, and gives some sensible advice for its prevention. The great danger is from the presence of these lead-salts in the air in the form of a fine dust, and efficient ventilation is one of the great safeguards. On the recommendation of Dr. Russell, the Health Officer of Glasgow, ventilators were placed in one of the rooms, and for the next six months those working in that room escaped disease.

The symptoms of this kind of poisoning are at first slight and easily mistaken for dyspepsia; the complexion becomes dull and sallow, the spirits are depressed, there is loss of appetite and some pain in digestion, and for a time this is all that is noticed.

Dr. Scott urges the use of a respirator when working in the poisonous dust, the wearing of linen overclothing, which should be frequently washed, frequent bathing and thorough cleanliness, frequent washing out of the mouth, the use of a weak sulphuric acid lemonade and a small dose of Epsom salts once a week.

CAMBRIDGE, MASS., LIBRARY PLANS.

MR. FREDERICK RINDGE, now residing in California, a son of the late Hon. Samuel Rindge, of Cambridge, Mass., has made a generous donation to his native city of Cambridge which has been accepted. The Dana Library, which has been in existence for a number of years, is the only institution in Cambridge that can be said to approach a public library, and although it fulfilled the ideas of the founder when it was created the constant increase of population since has rendered it practically of no value at the present time. Mr. Frederick Rindge, who appreciated the condition of things, has donated to the city as a site a tract of land in a central location, valued at about \$55,000, and has agreed to contribute \$75,000 toward the erection of a suitable building. The city of Cambridge has accepted the gift and will meet any deficiency in excess of the sum proposed by Mr. Rindge. The first step toward carrying out the purpose of the donor has been in asking five architects, Messrs. Chamberlain & Whidden, Peabody & Stearns, W. P. Wentworth, Van Brunt & Howe, and McKim, Mead & White, to furnish competitive designs on or before August 15.

CINCINNATI CITY HALL COMPETITION.

THE plans submitted by Samuel Hannaford & Son, in the competition for the designs of the City Hall, have been selected by the committee as the best, and Mr. Hannaford has been appointed Superintendent of Construction. The cost of the building will be about \$600,000. Work will be begun early in September.

THE Massachusetts Supreme Judicial Court has recently decided that the town of Brookline is liable in damages in causing a well to dry up in consequence of the construction of a system of sewerage, notwithstanding the well was not upon land taken for the purposes of the sewer nor adjacent to it.

JAMES INGRAM, since 1846 a master plumber and inventor of New York City, died in this city July 21, aged 78 years. Mr. Ingram was born in Belfast, Ireland, and came to America in 1846, entering the plumbing business, which he was connected with until 1878, when he suffered from a stroke of apoplexy, from which he never fully recovered. For the last year of his life he was confined to his room. He was the inventor of a number of improvements in sanitary appliances, among them a pan water-closet, a movable water-back range, and an iron sink. From 1866 to 1872 he was sanitary inspector to Board of Health of this city, and since 1852 a member of the Society of Mechanics and Tradesmen. His wife and five children survive him.

PERSONAL.

JOSHUA T. HEALD, founder of the Delaware Western Railroad, the Wilmington street-car system, and the sinking fund for the extinction of the debt of that city, died July 25, in his sixty-eighth year.

MR. W. L. CAMERON, who has for over fifteen years been secretary and superintendent of the Memphis Water Company has resigned the position of secretary and been appointed general superintendent of the company.

LIEUT. CHITTENDEN, U. S. Engineer Corps, lately stationed at Willet's Point, N. Y., has been transferred to Omaha, as Engineer Officer, Department of the Platte.

MR. JAY STONE has resigned his position as Chief of the Correspondence Division of the War Department and accepted the Secretaryship of the Board of Army Engineers, of which Col. Thomas Lincoln Casey is President.

CHIEF ENGINEER THOMAS WILLIAMSON, U. S. N., has been appointed Superintendent of the State, War and Navy Department Building in the place of the late Chief Engineer Snyder.

HYGIENE DE LYON. Compte rendu des travaux du Conseil d'Hygiène publique et de Salubrité du Département du Rhone, 1800-1885. 466 pp., 8vo. Lyon: A. Storck. 1887.

This volume, which is entitled "Première Partie," indicating that others may follow, is prepared by Dr. A. Lacassagne, the Secretary of the Council of Health, and contains meteorological statistics, the geology of the place, and accounts of the water-supply, streets, sewers, schools, hospitals, cemeteries, etc., with the laws and municipal regulations affecting, and an account of the improvements which have been made or which are in progress.

By the census of May 31, 1886, Lyons had a population of 401,930. The mean annual death-rate for the last five years has varied between 22 and 24 per 1,000, while the birth-rate has been slightly less and appears to be diminishing. The total number of inhabited houses in 1885 was 15,798, containing 118,164 distinct sets of lodgings.

The questions of water-supply and of sewage disposal have not yet been settled satisfactorily, and the reports on these subjects are largely occupied with discussions of the relative merits of various schemes which have been proposed.

A contemporary (*Industries*) states that Messrs. Chaudet & Naudin, of Paris, have lately introduced a new scheme of ventilation for textile mills, the idea being to obviate the excessive dryness of the air, which is detrimental both to health and to the threads of fabrics. They accomplish this by the introduction of steam. Air and steam are distributed by zinc tubes running through the work-room, pierced with 1/2-inch holes at 4-inch intervals. An air-propeller of 20 inches diameter, discharging 7,000 cubic feet per minute, is said to suffice for a room 110 feet long, 80 feet wide and 15 feet high. Steam is blown into the propeller at the inlet, and is thereby mixed with the air as it passes through the fan and tubes.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS

NEW YORK CITY.—The Grant Monument Association have received designs from a number of American and foreign sculptors and architects, including C. Vaux, of New York; Joseph Echleter, of Bavaria; George Matthias, of New York; Max Schreff, of New York; W. G. Steinmetz, of New York; Mr. Story, of Rome, Italy.

Persons who make any use of the information they find in these columns we trust will not omit to mention **THE SANITARY ENGINEER AND CONSTRUCTION RECORD** as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 229-230-231-232.

WATER. SEWERAGE. ETC.

ST. CLOUD, MINN.—Proposals for purchasing the water-works were received as follows: Hiram Upham, Minneapolis, \$15,000; H. W. Phelps and E. T. Sykes, Minneapolis, \$19,000; C. E. Gray, Fergus Falls, Minn., \$20,000.

NORFOLK, NEB.—A. L. Strong has the contract for building water-works here at \$3,900 per annum for 50 hydrants.

ALLENTOWN, PA.—The contract for a pumping-engine capable of pumping 3,000,000 gallons of water daily against a head of 210 feet, has been awarded to the Knowles Steam Pump Company at \$17,900. A list of bidders was given under issue of June 25.

MARINETTE, WIS., has rejected proposals received July 2 for water-works and will try to arrange for a supply with the Menominee Water Company.

SIDNEY, O., proposes to make improvements in the water-supply at a cost of \$80,000.

RICHMOND, VA.—Address Col. Bolling about the proposed new filtering reservoir.

ST. LOUIS, MO., proposes to spend \$219,000 on extensions of its water service.

WASHBURNE, WIS.—Water-works will be built here.

LINCOLN, NEB.—Joseph Burns has proposed to furnish an additional 2,000,000 gallons of water daily at \$8,855.

KALAMAZOO, MICH., wants additional water-supply.

ORANGE, N. J.—The sewerage question is under discussion. Health Officer Buttner proposes a system of disposal to cost about \$250,000, of this the disposal works to be erected immediately at a cost of \$25,000.

LAFAYETTE, IND.—W. R. Coates, C. E., of Kalamazoo, Mich., has just reported on the changes needed to put the water-works in good condition. He puts the cost at \$43,500.

HUMMELTOWN, PA.—F. J. Schoffner will obtain a charter for a company to build water-works here.

MILLEDGEVILLE, GEO.—The contract for water-works has been submitted to City Council, and as soon as they sign it the works will be pushed forward.

EXETER, N. H.—The Exeter Water-Works will inquire into the cost of a filtering-plant.

MANSFIELD, MASS.—A town meeting will soon be held to see if the town will accept a charter granted by the Legislature a year ago to build water-works for fire and domestic purposes. If it will not, then to see if the town will agree to pay the Mansfield Water Company a certain sum for the use of water for fire purposes.

ALLISON, IOWA, wants water-works.

OSHKOSH, WIS.—There is a movement on foot for the city of Oshkosh to purchase the water-works plant, which is at present owned by a few citizens, and is valued at \$340,000.

ERIE, PA.—City Engineer Platt proposes to secure fine water by sinking a well on the Peninsula and letting the water of the lake filter into it through the sandy soil.

MERRILL, WIS.—C. D. Barstow, of Muncie, Ind., has charge of the work of constructing water-works for this city.

ALBANY, PA., July 25.—Judge Albright to-day overruled a motion for a preliminary injunction restraining the city from erecting new water-works. Councils in February ordered that the Fountain House property of sixteen acres be purchased and water-works erected thereon, the improvement to cost \$50,000. The people at the municipal election decided that the public debt should be increased by this amount. Several prominent citizens protested, and their protest took the form of a motion for a preliminary injunction, which the court has refused to consider. A motion was then made for the appointment of a master to take testimony, and the court has appointed S. A. Butz, Esq.—*Philadelphia Press*.

CRETE, NEB., July 21.—"Sealed bids will be received by the City Clerk of Crete, Neb., up to September 6, 1887, for the construction and maintenance of a

system of water-works for the city of Crete on franchise system. Franchise to be given for twenty-five years. Plans and specifications will be ready in a very few days, and will be mailed to any party desiring to bid.—F. D. Williams, City Clerk."

NORTH PLATTE, NEB.—"A franchise has been granted the American Water-Works and Guarantee Company, Limited, of Pittsburgh, Pa., for a term of twenty years, the work to be completed by July 14, 1888, and are to be begun by September 15, 1887.—E. B. W."

RUSHFORD, MINN.—Our correspondent writes: "There will be nothing done towards establishing water-works in this city."

MINNEAPOLIS.—The Council Committee on Streets has voted to recommend the construction of the Nicollet Avenue sewer and a connecting branch on Twenty-fifth street, from Nicollet to Fifth Avenue south.

MARSHALL, TEX.—Address W. Windham, resident engineer, about the sinking of artesian wells for water-supply; cost, \$50,000.

ABERDEEN, DAK.—The question of sewerage is being agitated. Another artesian well is talked of. W. B. Sweet is the president of the new pressed-brick company just organized.

STILLWATER.—Messrs. N. Johnson & Sons have been awarded the contract for laying about three miles of pipe for the Hudson water-works. The bid was \$7,000.

CANON FALLS, MINN.—A water-works system will be built. Address F. B. Slager.

CANISTO, N. Y.—Incorporated is the Canisteo Water-Works Company; capital, \$25,000. C. D. Barstow, G. R. Harlow, J. H. Harlow, of Pittsburgh, Pa.; E. J. Harlow, Lowell, Mass., and others, incorporators.

CLOQUET, MINN.—The Cloquet, Minn., Water Company is incorporated; capital, \$20,000. J. E. Page, J. L. McCullough, J. F. McGarvey, and others.

MILWAUKEE.—A brick sewer will be laid in Fowler Street, from Thirtieth to Thirty-second Streets. Pipe sewers will be laid as follows: Garfield Avenue, Seventh to Eighth Streets; Sycamore Street, from Thirtieth to Thirty-first Streets; Second Street, from Wright to Clark Street; Knickinnick Avenue, from Lincoln to Smith Street. Water mains will be laid in Twenty-eighth street, from Grand Avenue to Clybourne Street; also in Orchard Street, from Sixth to Seventh Avenue.

MEMPHIS, TENN.—The city is having a contract drawn up with the Artesian Water Company, by which the latter is to furnish a supply of water from wells.

TORONTO, ONT.—Water-Works Superintendent Hamilton has prepared a scheme for a new reservoir on Wells' Hill, to be supplied through a three-foot pipe from pumping-engines which he would recommend should be placed either beside the present pumping-engines where the city had sufficient vacant and taking the water from the lake by a conduit, pumping the water into the proposed new reservoir through pipes to be laid along Bloor and other streets. He favored putting new pumping-engines somewhere near Mimico, and thereby saving the great cost of a new conduit across the Toronto Bay. Mains from pumping-engines at Mimico to a reservoir at Wells' Hill would be cheaper than a new conduit across the Bay. The present reservoir is about 212 feet above the Bay. The proposed new reservoir would be about 300 feet above the Bay.

GREENSBORO, N. C.—The Board of Aldermen have engaged E. W. Bowditch, C. E., of Boston, to make a survey for water-works.

OAKLAND, CAL.—Mr. J. H. Woodward has bonded 513 acres of the Laundry farm back of East Oakland, and also 100 acres of the Hooker and Camden tract near by. It is rumored that the land is to be secured for the purpose of constructing water-works. It covers a water shed of twenty-four square miles, sufficient to afford an ample supply of water to Oakland, Alameda, and Berkeley. It is understood that a large amount of capital is interested in building on the land reservoirs and other water-works.

SPARTA, WIS., wants a pump for fire protection.

CLINTON, WIS., is discussing the building of water-works.

MILLBURY, MASS., is applying to Worcester to extend the latter's mains to supply Millbury with water.

MADISON, WIS., is considering the lake as a source of water-supply.

JANESVILLE, WIS.—The Janesville Water Company has been incorporated.

MILWAUKEE.—A 6-foot brick sewer will be built in Washington Street on the South Side.

VAN BUREN, ARK.—Our correspondent writes: "The City Council has accepted a proposition from the Water, Light and Power Co., of St. Louis, Mo., to construct water-works, the Water Co. reserved thirty days for their acceptance and filing of bond. The time has expired and the Water Co. have failed to file their bond. I am in correspondence with them, but cannot tell whether we will have water or not. If the contract is consummated I will inform you."

MECHANICSTOWN, MD.—Our correspondent writes: "We have commenced the construction of water-works; the reservoir has been completed and lies 170 feet higher than our town, distance 1 1/2 miles. Over one mile of the trench has been dug for the laying of pipe and we expect to have all completed by September 1. We get our water from the mountains from a pure stream of spring water."

FLORENCE, ARK.—Contracts have been let and work will commence August 1.

PASADENA, CAL.—The city has voted \$102,000 bonds for sewerage; only two votes were cast against the proposition.

The San Francisco Sewer-Pipe Company was the successful bidder for 5,600 feet 20-inch and 7,050 feet 18-inch vitrified sewer pipe; price \$1.40 per foot for 20-inch; \$1.20 for 18-inch pipe.

WYTHEVILLE, VA.—A committee consisting of Messrs. J. W. Caldwell, H. B. Maupin, H. G. Wadley and Isaac Frank, have been appointed to contract for the construction of water-works and electric light plant.

SENeca, S. C.—Efforts are being made to establish a system of water-works.

FORT SCOTT, KAN., will have complete new pumps, boilers and stand-pipe to cost \$200,000. Their capacity will be to furnish 2,000,000 gallons of water per day.

BIRD CITY, KAN.—Our correspondent writes: "Our city has voted bonds to the amount of \$5,000 for the purpose of putting in a small system of water-works, and negotiations are now pending and the contract will probably be let in a few days for the construction. John H. Humlog is City Clerk."

TUSCALOOSA, ALA.—Our correspondent writes: "The establishment of water-works is being considered by our City Council and will be decided in a little while. The City Clerk is A. P. Hogan."

KAUKAUNA, WIS.—Our correspondent writes: "The question of water-works at our last special meeting was laid on the table for further consideration."

AUSTIN, MINN.—Our correspondent writes: "We have prepared plans and specifications for a system of water-works at this place. We shall lay from four to five miles of pipe, size, 4, 6, 8 and 10-inch. We shall use the direct-pressure system. Domestic supply will be taken from four to six wells. For fire purposes we will connect with the Cedar River. Have purchased grounds. Commenced to sink wells. We intend to put in machinery and about two miles this season."

CHATTANOOGA, TENN.—The Board of Public Works is preparing to construct sewers, to cost \$50,000.

PROVIDENCE, R. I.—The Board of Public Works opened the bids, July 21, for the laying of the iron water-pipe to connect Hope Reservoir with the proposed station at Fruit Hill, and awarded the contract to James J. Newman, of this city. The distance is about four miles long, and it will require about 2,500 tons of 24-inch pipe and castings. The work will be commenced August 1, and will require at least three months for completion. The bids for the construction of the reservoir at Fruit Hill will be opened on August 9, the required capacity of the receptacle being 25,000,000 gallons, which is about one-half that at Sochanoset and one-third that at Hope Station.

KALAMAZOO, MICH.—We have received a letter from Mr. W. R. Coates, Hydraulic Engineer, of this city, from which we extract the following items of interest: "Relative to South Williamsport, Penn., and Columbia, Mo. water-works, I have made investigations, estimates, and reports in both these cases recently. I doubt if either of these places build works this season. Petersburg, Ill., where I have recently made plans, has voted to go forward and build the works at once. I have just returned from Lafayette, Ind., and send you by this mail a Lafayette paper with a notice of what I have been doing there. I go to Benton Harbor and St. Joseph, this State, to plan water-works improvement for those cities, and from there to West Superior, Wis., for a similar purpose."

BISMARCK, DAK.—With reference to water-works here, our correspondent writes: "All pipe and other material required in quantities for the work here is purchased by Morison & Corthell, Civil Engineers, Chicago, 205 La Salle Street."

SEATTLE, W. T.—The Spring Hill Water Company is building a reservoir on Ridge Lawn, to hold 4,000,000 gallons of water. New pumps will be erected.

WHITEWATER, WIS., wants bids for water-works, and H. S. Salisbury, City Clerk, will receive same.

WATER-WORKS are proposed in the following places: Cuba, N. Y.; Castile, N. Y.; Atalla, Ala., (L. P. Brown); New Glasgow, N. S.; Skaneateles, N. Y.; water-works company; Manitou Island, Minn.; water-works company.

DENVER, COL.—The Mayor and heads of departments are discussing the construction of a complete system of sewers. The Mayor estimates the cost at \$150,000.

MONTGOMERY, ALA.—The proposition made by George A. Ellis, of Durham, N. C., to construct a system of sewerage, has been accepted. Work will be begun about October 1.

LExINGTON, VA.—The question of enlarging the water-works is being considered by the City Council.

KISSIMMEE, FLA.—The question of water-works is being agitated. The City Council are conferring with Newark Filtering Company, of New York; Peter Herdie Company, of Orlando, Fla., and others, in regard to the matter.

DAVID CITY, NEB.—Plans and specifications for water-works are being prepared by A. A. Richardson, C. E., of Lincoln, Neb. He will also prepare the plans and specifications for water-works at Loupe City, Neb.

WILLIMANTIC, CONN.—Plans for sewerage have been prepared by the Committee. A town meeting to take action will soon be called. Address George W. Mahony, of the committee.

NEWBURG, N. Y.—The Board of Water Commissioners are investigating methods of increasing the water-supply. Engineer Garrison is preparing an estimate of the cost of laying a 30-inch iron pipe from Silver Creek to Washington Lake.

MARTINEZ, COL.—Gas-works are talked of here.

MOTT, SISKIYOU CO., CAL., will have water-works. The machinery has arrived.

SANTA CRUZ, COL., is agitating the sewerage question.

TORONTO, ONT.—The committee appointed to inspect the water-works of Buffalo, Rochester, New York, Philadelphia, Boston, and other cities has returned and will report soon.

NEWBURG, N. Y.—The Committee on Sewers have under consideration the construction of a trunk sewer from West Newburg to the Hudson River.

ALTOONA, PA.—The Water Commissioners are just advertising for proposals for finishing Kittanning reservoir, and for 16-inch pipe. A contract for pipe and special castings has been given to R. D. Wood & Co., of Philadelphia.

BRANTFORD, ONT.—Mr. Haskins, of Hamilton, Ont., Water-Works, has reported in favor of driven wells at Holmesdale for increasing the water-supply. He has also reported on a sewerage system.

MANCHESTER, CONN.—Dwight Spencer contemplates introducing water in the north village. The reservoir he proposes to build will be nearly a hundred feet above the post-office. It will be located half way to Manchester Green and will flood about an acre. It will be fed entirely by springs, and will supply a 4-inch pipe. Work has already begun on the reservoir and pipes will be laid as soon as patrons enough are secured to guarantee interest on the investment.

WATER-WORKS.—Bids were opened at Charles City, Ia., July 20, and the contract was awarded to the Eclipse Wind Engine Company of Beloit, Wis., for the piping and machinery for the sum of \$14,900. The city build the buildings, and flume, and foundation. The bids for Valparaiso, Neb., will be opened at Valparaiso July 30. Plans were prepared by A. A. Richardson, C. E., of Lincoln, Neb.

CHICAGO.—Manufacturers of pumping-engines should watch developments. It is probable that bids for new engines will be asked for in connection with the new water-works tunnel.

CANTON, MASS.—At a special meeting this week the town voted to accept the act providing for the obtaining of a water-supply. On August 10 three water Commissioners to obtain works will be appointed.

LAPER, MICH., is to have a system of water-works. For further information address C. G. White.

CROOKSTON, MINN.—The Crookston Water Power and Light Company will improve their plant.

COLUMBUS, O.—Messrs. R. Curtis, J. Kilroy, and L. W. Sherwood, Water-Works Trustees, propose enlarging their plant.

LINCOLN PARK, CAL.—The Lincoln Park Land and Water Company has been incorporated with a capital stock of \$12,000. J. A. Woods, J. P. Early and others, incorporators.

MONTREAL, CAN.—The Road Committee has annulled the contracts for sewers, recently awarded, as exceeding the appropriations, and is considering the advisability of advertising for new bids.

CATONSVILLE, MD.—The Catonsville Water Company has awarded to T. C. Bashor & Co., of Baltimore, the contract for putting up an iron stand pipe, or water tank, 25 feet in diameter and 50 feet high, with a capacity of 185,000 gallons of water. It will be constructed of half-inch boiler iron, and will cost \$6,000. The company has also contracted with the McNeal Pipe and Foundry Company, of Burlington, N. J., for 450 tons of iron pipe, the delivery of which will be commenced on August 10. The Worthington pump, which was ordered some time ago, will arrive on August 1. It has a capacity of 500 gallons per minute. Mr. William Gerwig, of Catonsville, has been awarded the contract for putting up the pump and boiler-houses. The pump house will be 16x24 feet, and the boiler house 16x16 feet. Both will be of wood, one story high. The original \$30,000 worth of stock has nearly all been taken, and a meeting of the directors will be held in a few days to consider the advisability of issuing the remaining \$30,000 worth authorized by the charter. Water will be supplied to subscribers in Catonsville by September 1.

EMPORIA, KAN.—The city is considering the renewal of a lease or the purchase of the water-works owned by it.—T. Soden.

OROVILLE, CAL.—The Butte and Yuba Orange Belt Irrigating Canal Company was incorporated here July 19, with a capital of \$1,000,000. They have the right to 100,000 inches of water from the main Feather River, taken out about seven miles above this town and carried along the citrus belt of Yuba and Butte counties. The incorporators represent over \$1,000,000 of cash capital. The surveying of the canal has already begun, and the work will be pushed to a rapid completion.

GAS, STEAM, BUILDINGS, ETC.

ROCHESTER, MINN.—Incorporated is the Rochester Electric-Light Company; capital, \$30,000. It will supply electricity for light and motors.

SIoux CITY, IOWA.—A company is forming here to prospect for natural gas.

NEW LEXINGTON, O.—City Council has contracted with the Union Electric Light Company to light the streets, the contract running five years.

BENNINGTON, N. Y.—At a special village meeting recently the trustees were instructed to contract with the Bennington Electric Light and Power Company to light the streets in whole or in part by electricity. The company estimated that twelve arc and sixteen incandescent lamps would sufficiently light all the principal streets, the outskirts of the village to be lighted by gas-oil and kerosene, but there are seven miles of streets to be lighted, and it is thought by many that the number of electric lamps proposed is too small. The contract is to run for five years at an annual expense of \$1,600.

MARTINEZ, CAL.—It is proposed to build gas-works here.

PHILADELPHIA.—A contract for constructing a purifying-house, pans and connections at the Ninth Ward Gas-Works has been let to James R. Floyd, at \$25,200.

SAN ANTONIO, TEX.—Rids for lighting the streets have been received by Mayor Callaghan as follows: The San Antonio Gas Company, \$3 per street lamp per month for one year, or \$2.75 per lamp monthly if the city will contract for two or more years; new posts \$22 each; gas for public buildings, \$2 per 1,000 cubic feet. The company will also furnish electric lamps at \$64 per annum for arc lights; for incandescent lights, 16 candle-power, \$23 per annum.

The Southern Electrical Construction and Supply Company will erect a tower for 2,000 candle-power arc lights, to be lighted until 1 A. M., for \$15 per month, and 300 18 candle-power incandescent lights at \$28 per lamp per annum, lighted 4 hours a night. Also it is offered to maintain 2,000 candle-power arc lights, all night and every night, for \$70 each per annum, and 16 candle-power incandescent lights, all night and every night, at \$25 per annum.

The Electric Light and Power Company will maintain 2,000 candle-power arc lights at 90 cents per lamp per night each, and 16 candle-power incandescent lights at \$25 per lamp per annum, lights burning all night; the lamps to be lighted 24 nights in each month.

HARRISBURG, PA.—Charters were issued from the State Department July 25 as follows: The Overhead Conductor Electric Railway Company, of Pittsburgh; capital, \$300,000. The company proposes to purchase and sell patent rights for electric railway purposes. The Union Building and Loan Association, of Pittsburgh; capital, \$200,000. Presque Isle Natural-Gas Company, of Erie; capital, \$11,500.

BROOKLYN, N. Y.—A certificate of incorporation of the Brooklyn Heat and Power Company was filed at Albany, July 2. Its objects are to manufacture and sell hot water, hot air or steam, and to lay pipes for conducting hot water, steam or hot air through the streets, squares, and in public and private buildings of the city of Brooklyn. The amount of capital stock is \$25,000. The incorporators and trustees are Theodore M. Vail, of Boston, Mass.; David B. Park, of Randolph, N. Y., and Delmore Elwell, of Brooklyn.

FLUSHING, L. I.—Next Monday, August 1, John H. Wilson, President of the village, will sell a franchise for electric-lighting for the streets.

GREENFIELD, MASS.—Gas Company has reduced the price of gas to \$2.50 per 1,000 cubic feet, with a discount for prompt payment.

BENNINGTON, VT.—Town meeting has empowered the village trustees to make a contract with some electric-light company to light the streets by electricity.

FERGUS FALLS, MINN.—The following were elected officers of the Fergus Falls Brush Electric Light Company: President, Charles L. Lewis; Secretary, F. G. Barrows; Treasurer, James Compton. The capital stock is \$15,000; continuance, thirty years. The company has closed contracts with the Heysler Electric Company, St. Louis, for two dynamo engines with a power of 340 lamps, thirty-candle, and will put in a steam plant, fifty horse-power.

ERIE, PA.—On Monday the Presque Isle Natural-Gas Company will open proposals for sinking a gas-well to a depth of 4,000 feet if such depth be necessary.

PALESTINE, TEX.—Mining and Petroleum Company is organized.

MARBLE FALLS, TEX.—Address A. R. Johnson about gas-works to be built here.

HALIFAX, N. S.—The City Council received bids July 27, for lighting the streets by electricity, as follows:

Halifax Gas Light Company: 1. For 100 arc lights, of 2,000 candle-power each, within a radius of one and a quarter miles from the post office, and including lights on Gottening Street to Young Street, and on Campbell Road to Richmond, \$70 each per annum.

2. For any extra arc lights, of 2,000 candle-power, within the above limits, \$70 each per annum.

3. For any additional arc lights, of 2,000 candle-power, beyond the above named limits to the extent of half a mile, \$80 per annum.

4. For 50 incandescent lights, of not less than 50 candle-power, within the limits described in clause No. 1 as above, \$28 each per annum.

5. For any additional incandescent light, of not less than 50 candle-power, beyond the limits described in clause No. 1, to the extent of half a mile, \$32 per annum.

Halifax Electric Light Company: 100 arc lights 2,000 candle-power, at \$90 a year; 50 incandescent lights, 50 candle-power, at \$25. Additional incandescent lights at the same price. Each additional arc light at \$50 a year.

The bids were referred to the Board of Works.

NORFOLK, VA.—Bids for lighting the city, 1,200 candle-power electric lights, were received July 25. The American Electric Light Manufacturing Company, of New York, proposed to light 155 lamps, by the moon's schedule, for \$12,245, and to light the city buildings for \$775. For lighting the city all night and every night they bid \$14,000.

The Brush-Swan Company, of Norfolk, the present contractors, agree to light 155 lamps, by the moon's schedule, for \$12,167.50, and to light the city buildings for \$756. For lighting the city all night and every night they bid \$13,950.

The bid of the Brush-Swan Company for lighting the city all night and every night, and for lighting the city buildings, amounts to \$14,706 per annum, as against \$14,775, bid by the American.

The committee recommended that the Brush-Swan bid be accepted.

RAILROADS, BRIDGES, CANALS.

RAILROAD.—A railroad will be built from Kalkaska to Elk Rapids, Mich.

ASHEVILLE, N. C.—Chief Engineer Ramasour, of the Carolina and Knoxville Railroad, is pushing the surveys of the line.

BUFFALO, N. Y.—President Wilson S. Bissell has had a consultation with E. M. Leuffer, the recently appointed Chief Engineer of the Buffalo and Geneva Railroad, and General Superintendent Stevenson of the Lehigh Valley, the result of which, it is said, will be the speedy completion of the new line, which will be a link in the Lehigh Valley system. Bids for laying the 205 miles of track will soon be asked for.

HARRISBURG, PA.—A charter was issued last week for the Monongahela East Shore Railroad Company, of Pittsburgh, with a capital of \$50,000, to build a line about two miles long. Charles Donnelly is president of the company.

OTTAWA, ONT.—Cummings' bridge will be rebuilt in iron and stone.

CHICAGO.—The Metropolitan Railway Company, with a capital of \$2,000,000, filed articles of incorporation at Springfield, July 23. The object is to build an underground railway under the city of Chicago, to reach nearly all the townships in Cook County and form a belt railway.

AVONDALE, N. J.—The Board of Freeholders will advertise for new bids for a bridge. The first lot were rejected.

WHEELING, W. Va.—The Secretary of State, July 26, granted a certificate of incorporation to the Wheeling Electrical Railroad Company, and the corporation has made application to Council for permission to maintain a track through certain of the principal streets of the city commencing at Main and Tenth and running to and through the town of Benwood, in Marshall County. The track is to be commenced in four months and cars are to be running in one year.

PLATTSBURG, N. Y.—The Chateaugay Railroad, between Plattsburg and Loon Lake, is being extended from Loon Lake westward to Saranac Lake, a distance of about eighteen miles, and will be completed before winter.

LAWRENCE, MASS.—The contract for the iron work on the new Union Street bridge at Lawrence was awarded July 20 to the Boston Bridge Company, the cost to be \$19,700, and the work to be completed by February.

BROOKLYN.—A bridge will be built over the Canal at Carroll street. The plans have not yet been decided upon.

PHOENIX, ARIZ. will have a street railroad.

BROOKLYN.—The Department of City Works has approved the plans of the Union Elevated Railroad for a structure on Myrtle Avenue and other streets.

GREENSBORO, N. C.—A franchise has been granted to Dr. J. W. Griffith to establish a street railway. Work will soon begin.

BROOKLYN.—The appropriation of \$100,000 in the budget for the present year for street repairs will be expended on the following streets, which are to be paved with granite blocks: The upper part of Bedford Avenue, running out to Greenpoint; Manhattan Avenue, from Bedford Avenue to Greenpoint Avenue (which is to be widened two feet and regraded); Prospect Place, from Union street to Eighth street; Fourth street, from Union street to Grand street; Hancock street, from Bedford to Nostrand Avenues.

NEW YORK.—A syndicate, composed of New York and London bankers, has agreed to furnish the money necessary for the construction of the Chattanooga, Rome and Columbus Railroad; and President Williamson, who has been in this city conducting negotiations, will begin work on the line at once.

RICHMOND, VA.—The Virginia Construction Company, of this city, has contracted with the Tennessee Midland Railway Company to build 135 miles of the latter's road.

DENVER, COL.—city engineer has recommended the construction of an iron bridge on Nineteenth Street to cost \$35,000. The matter is referred to a committee of the Board of Aldermen.

ST. PAUL.—The Railway and Navigation Company was incorporated here July 25. Capital stock, \$10,000,000. The incorporators are citizens of St. Paul. The object is to build a road from the Twin Cities to a point on Lake Superior, and a new line of boats in connection therewith. It is to be an extension of the Minnesota and North-western.

MILWAUKEE.—The West Side Street Railway Co. has a bill before the Council petitioning to lay tracks and run cars from Wisconsin Street on Marshall to Brady, and on B-ady Street to Cambridge Avenue.

It is proposed to build a cable road from Chestnut Street to Wauwatosa, passing through a road built on Mr. Schoonmaker's property. This will do away with the objections that have been raised to the Blue Mound Road project.

The Cream City Railway will extend its tracks from North Water Street over Pleasant Street bridge, and on Dock Street to Island Avenue, thence north on Island Avenue to North Street, east on North to Booth, and north on Booth to city limits.

The Milwaukee City Railway is petitioning for the above right of way, but the Cream City Company will get it.

WINONA, MINN.—The directors of the Winona and Southwestern held a protracted meeting July 24 to decide upon plans for building the road. L. J. Monroe and General A. B. Nettleton, representative of Minneapolis syndicate, and General Jones, of Chicago, are conferring with them, each offering to build the road.

LITTLE ROCK, ARK.—The Desha and Eureka Springs Railroad Company, capital stock \$1,150,000, has been incorporated to build a railroad from Eureka Springs to Pendleton, 210 miles. The directors are George P. Bangs, William L. Stowe, E. E. Pratt and H. M. Cross, of Boston, Mass., and James Murphy, W. B. Dutton and others, of Arkansas City, Ark.

RAILROAD.—Major G. B. Phinney is in charge of the surveys of the St. Louis, Kansas City and Colorado Railroad, which is being pushed toward Clinton, Mo.

CHICAGO.—The Chicago, Rock Island and Pacific Railroad Company will replace the wooden viaduct at Twelfth Street with one of iron costing \$200,000. The city pays \$200,000 of this amount.

SYRACUSE, N. Y.—Franchises to lay tracks for street railroads have been granted by the Aldermen to the People's Railroad Company and the Third Ward Railway Company.

LAWRENCE, MASS.—The Bridge Committee has awarded the contract for building the piers and abutments of the new bridge across the Merrimack River to Trumbull, Cheney, Meulton and O'Mahoney. The bids are as follows: For all granite laid, \$24.50 per cubic yard; rubble, \$5.75; rip-rap, 75 cents.

INDIANAPOLIS, IND.—The State Line and Indiana City Railway Company filed articles of association July 25. It is the intention of the company to construct a line of road about twenty-five miles in length from the Eastern Illinois boundary to Indiana City, on Lake Michigan. The capital stock is \$500,000, and the following are the directors: J. T. Torrance, Carroll N. Towle, William H. Gostlin, James S. Prentiss, and Thomas W. Johnstone.

Articles of consolidation of the Leroy and Eastern, an Illinois Company, and the Lebanon and Western, an Indiana railroad, have been filed. The roads connect at the State line, and will hereafter be known as the Rantoul Railroad Company, with headquarters at Chicago. Stuyvesant Fish, B. F. Ayer, J. C. Welting, John Dunn, and Henry De Wolfe are named as directors of the consolidated Company's affairs.

BRIDGE.—The Boston and Providence Railroad Company has had plans prepared for rebuilding the Bussey bridge.

BIDS OPENED.

GALVESTON, TEX.—The contract to deepen the Galveston Harbor has been awarded to Messrs. Fagin & Burke, of Mobile, Ala.

LITTLE ROCK, ARK.—Synopsis of bids received by the Board of Public Affairs for 1,400 feet of 6-foot brick sewer, circular, from Fourth and Louisiana Streets to the Arkansas River: Patrick Powers, \$11,000; G. P. C. Rumbough, \$10,010. \$1 per cubic yard extra for rock excavation; E. A. Weigel & Co., \$7,950, 50 cents per cubic yard extra for rock excavation. Contract awarded to E. A. Weigel & Co.

NEW HAVEN, CONN.—Abstract of bids for sewers' opened July 30, by A. B. Hill, City Engineer: Lawrence Street, Orange to Whitney, L. O. Breen, 30-inch sewer, \$5 per lineal foot; 24-inch sewer, \$3.50 per lineal foot; 12-inch culverts, \$1.50; catch-basins, \$1.15 each; manholes, \$40 each; total, \$6,020.

A. Brazos & Sons, \$5.40; \$3.65; \$1.25; \$100; \$40; total, \$6,325.

Matthew Kehoe, \$5.25; \$3.75; \$1.25; \$103; \$52; total, \$6,395.

Anthony Carroll, \$6; \$5; \$1.50; \$130; \$50; total, \$7,770.

Sachem Street and Winchester Avenue: A. Brazos & Sons, 24-inch sewer, \$4.15 per foot; 18-inch sewer, \$1.98 per foot; 12-inch culverts, \$1.50 per foot; 12-inch culverts, \$1.25; catch basins, \$100 each; manholes, \$48; total, \$2,434.50. Contract awarded.

M. Kehoe, \$5.50; \$2.35; \$1.40; \$1.10; \$100; \$50; total, \$2,475.

M. S. & J. H. Austin, \$5.50; \$3.40; \$2.60; \$1.50; \$120; \$60; total, \$3,715.

Anthony Carroll, \$5; \$3.25; \$2.40; \$1.50; \$115; \$55; total, \$3,475.

Bristol Street: Matthew Kehoe, 24-inch sewer, \$3.65; 15-inch sewer, \$1.58; 12-inch culverts, \$1.25; catch-basins, \$100; manholes, \$50; total, \$4,317.30. (Contract awarded.) A. Brazos & Sons, \$2.65, \$1.55, \$1.25, \$100, \$50; total, \$4,335.50. Anthony Carroll, \$4.75, \$2.70, \$1.50, \$125, \$55; total, \$6,129.50. M. S. & J. H. Austin, \$5.50, \$3, \$1.50, \$118, \$62; total, \$6,867.

Cottage Street: A. Brazos & Sons, 15-inch sewer, \$1.65; 12-inch sewer, \$1.10; 12-inch culverts, \$1.25; catch basins, \$100; manholes, \$50; total, \$1,370.50. (Contract awarded.) M. Kehoe, \$2.25, \$1.10, \$1.10, \$50, \$50; total, \$1,505.50. M. S. & J. H. Austin, \$2.50, \$1.45, \$1.25, \$115, \$55; total, \$1,670.50. A. Carroll, \$2.80, \$1.90, \$1.30, \$115, \$60; total, \$2,008.

Woolsey Street: A. Brazos & Sons, 15-inch sewer, \$1.50; 12-inch culverts, \$1.25; catch basins, \$100; manholes, \$50; total, \$1,210. (Contract awarded.) M. Kehoe, \$1.95, \$1.25, \$1.10, \$55; total, \$1,372.50. M. S. & J. H. Austin, \$2.30, \$1.40, \$1.15, \$55; total, \$1,573. Anthony Carroll, \$2.40, \$1.40, \$1.15, \$65; total, \$1,650.

Nicol Street: A. Brazos & Sons, 5-inch sewer, \$1.70; 12-inch culvert, \$1.25; catch basin, \$10; manholes, \$60; total, \$612. (Contract awarded.) M. Kehoe, \$1.85, \$1.30, \$1.05, \$50; total, \$619.50. A. Carroll, \$2.75, \$1.25, \$1.15, \$55; total, \$827.50.

Dixwell Avenue: A. Brazos & Sons, 12-inch sewer, \$1.12; 12-inch culvert, \$1.25; manholes, \$50; total, \$945.70. (Contract awarded.) M. Kehoe, \$1.40, \$1.20, \$50; total, \$1,114. M. S. & J. H. Austin, \$1.55, \$1.60, \$55; total, \$1,245.50. A. Carroll, \$2, \$1.65, \$60; total, \$1,542.50.

PITTSBURG, PA.—The following bids for constructing the Western Penitentiary of Pennsylvania were received by E. M. Butz, architect, July 27: For stone and brick-work.—Harrold & McDonald, Pittsburgh, \$120,900.

John Schirmer, Allegheny, \$119,950.

Morrison Bros., Allegheny, \$124,595.

Reese, Lindsay & Co., Allegheny, \$135,475.

A. Alston & Co., Allegheny, \$132,583.

Awarded to John Schirmer.

Cast-iron work.—Pennsylvania Construction Company, Pittsburgh, \$4,648. Awarded contract.

Union Foundry and Machine Co., \$6,366.

Fischer Foundry and Machine Co., \$4,870.

The building is to be finished July 1, 1888.

ALBANY, N. Y.—The following bids for a swing bridge and dredging Shinnecock and Peconic Bay Canal were received by James Shanahan, State Superintendent of Public Works, July 26: Ross & Sanford, New York, \$19,835.90; Frank Pidgeon Dredging Co., New York, \$15,737.85; S. V. R. Hendricks, Richville, N. Y., \$20,458. Awarded to Ross & Sanford.

GREEN BAY, WIS.—Bids for a draw-bridge over East River were opened by Council July 22, as follows:

Wrought Iron Bridge Company, Canton, O., \$5,630.

Milwaukee Bridge and Iron Company, one plan, \$4,700; one plan, \$5,000.

A. Y. Bain & Co., Minneapolis, Minn., \$5,470.

Wisconsin Bridge and Iron Company, Milwaukee, \$5,050.

F. E. Lane, Chicago, \$5,222.

King Iron Bridge Manufacturing Company, Cleveland, O., \$5,500.

One of the bids of the Milwaukee Bridge and Iron Company, the one of \$4,700, contemplated one less stringer than any of the others, allowing the sidewalk on each side to project over on the wooden sleepers.

NEW HAVEN, CONN.—At a meeting, July 25, the city and town joint board rescinded all contracts for constructing the county almshouse awarded under bids received a short time ago, and left the matter of new awards to a later meeting. We published the bids in a recent issue.

SCHENECTADY, N. Y.—The Supervisors opened bids, July 25, for the construction of a jail as follows: For a stone building, John McDermott, \$4,549; Andrew Kinnum, \$7,392. Mr. McDermott's bid for a brick and stone building was \$2,945, and Mr. Kinnum's, \$5,292.

The Westinghouse Company proposed to do the iron work for \$3,450, and William G. Caw's bid for the carpenter work was \$697. The contract for the mason work was awarded to John McDermott, he being the lowest bidder. The contract for the iron work was awarded to the Westinghouse Company, and that for the carpenter work to William G. Caw.

YOUNGSTOWN, O.—The following bids were received July 27 for paving Wick Avenue with fire-clay brick at Youngstown, Ohio (about 13,000 square yards):

Finch & Henderson, \$26,411.65.

Davis & Gore, \$30,905.10.

McElhaney & Walker, \$31,219.70.

The paving with brick, including concrete base, sand-ballasting, and filling joints with asphaltic mixture, per square yard, \$1.73.

PHILADELPHIA.—Contracts for the construction of six small cylinder boilers for the Gas Department, four for the Point Breeze Works, and two for the Manayunk Works, have been awarded to Sidebotham & Powell, at \$2,065. The other bidders were Henry Warden, \$2,475, and John Barzley \$2,475; also for 5,000 bushels of iron sponge to Connolly & Co. (Limited), the only bidders, at 44 cents a bushel.

Daniel McNicol was awarded the contract for excavating a cellar under the new City Hall, at 94 cents per cubic yard and the contract for the iron work to support the pavement over the cellar was awarded to the Phoenix Iron Company, of Trenton, at \$8,337.50.

MILWAUKEE, WIS.—Two contracts for street work were let by the Board of Public Works July 12. James Markey took the job of repaving Chicago Street from Broadway to East Water Street with stone blocks at \$2.60 per square yard. Chris Beck & Co. will grade and plank the sidewalks on Becker Street from Clinton Street to the Kinnickinnic River for 34 cents per lineal foot.

MONTREAL, CAN.—Bids for pumping apparatus (engines and boilers) for high-level service, Montreal Water-Works, received July 15: (Contract not yet awarded.) Blake Mfg. Co., Boston, \$12,080 and \$20,000; Holly Mfg. Co., Lockport, \$21,150; H. K. Worthington, New York, \$20,200; E. F. Gilbert & Sons, Montreal, \$22,500. The above bids were for engine to pump 2,000,000 gallons per 24 hours, a height of about 225 feet.

We referred to this matter last week.

GOVERNMENT WORK.

ABSTRACT of proposals for labor and materials for the erection of the Court-house at Fort Smith, Ark., entire building above concrete footings, opened July 25, by the Supervising Architect:

N. L. Wickwire, constructed in accordance with specifications, \$90,719; constructed with brick facing to basement walls, \$88,700.

Harris & Co., \$70,770; \$70,560.

Daniel A. Driscoll, \$82,435; \$80,980.

Daniel A. Driscoll with native bricks, \$77,837.

Bids opened by the Supervising Architect of the Treasury Department, July 27, for iron stairs for Post Office at Council Bluffs, Iowa, and for plaster and joiners' work for building at Concord, N. H., were both rejected, and new advertisements will issue for them.

SYNOPSIS of bids for iron, marble and slate-work of stairways for Post Office, etc., at Baltimore, Md., opened July 25 by the Supervising Architect:

Haugh, Ketcham & Co. Iron Works, \$44,950.

Poulson & Eger, \$58,000.

The Winslow Bros. & Co., \$49,500; with Concord Marble and with Red Tennessee Marble \$51,200 (informal).

PORTLAND, ME.—The following bids for removing ledge from Moose-a-Bec Bay were received by Major Jared A. Smith, U. S. Engineers, July 23:

George W. Townsend, Boston, Mass., \$24.83 per cubic yard, measured in place.

John F. Hamilton, Portland, Me., \$2 per cubic yard, measured in place.

Louis E. Lunt, Portland, Me., \$16.20 per cubic yard, measured in place. Acceptance recommended.

NEW YORK CITY.—Bids were opened at the Army Building on Thursday, July 28, by Deputy Quartermaster-General Henry C. Hodges for the masonry, iron work, and carpentry in the erection of a new gymnasium at West Point, N. Y. The following were the bidders:

Charles H. Bunn, New York City, masonry and iron work, \$26,822; carpentry, \$20,000; total, \$46,822.

James L. Lowry, New York City, for all, \$49,300.

John V. O'Rourke, Brooklyn, bid only on masonry and iron work, \$20,945.

MISCELLANEOUS.

YPSILANTI, Mich.—The town officials are preparing to convert an old cemetery into a park.

ALLEGHENY, PA.—Work has been commenced on the grand Penn Avenue entrance to the Allegheny Cemetery. The work will cost \$90,000.

ORLAND, CAL.—An irrigation canal is proposed.

FAIRPLAY, WIS.—A company of Eastern capitalists has purchased about thirty-five valuable mineral tracts lying between Fairplay and Shullsburg. The design is to sink a shaft 150 feet on the Burns place, in Smelser, and put in a steam-pump that will drain the surrounding country.

NEW YORK CITY.—New piers will be built on the site of "Screw Docks," recently bought by the city.

THE W. A. Fletcher Company of this city, has the contract for building the new steamer "Furitan" for the Fall River line.

DULUTH.—It seems probable that the new steamships for the Manitoba Railway Company will be soon built. Five steel steamers are contemplated to ship ore East via the lakes. It is learned that the new boats to be built by the Globe Iron Works for the Manitoba Company are to cost \$200,000 each. They are to be built after one model, 310 feet over all, 26 feet keel, 40 feet beam and 24 feet molded depth, with triple expansion engines; diameters of cylinders, 24, 38 and 60 inches, by 42 inches depth. Steam will be furnished by two boilers, each containing three turncases, and with a working pressure of 150 pounds. The steamers will carry 90,000 bushels of wheat, and when the line is completed it is reported that it will comprise twelve steamers and twelve consort. The costs of the consorts will be \$175,000 each, so that the whole line will cause an outlay of over \$4,600,000.

WASHINGTON, D. C.—The Secretary of the Navy will receive proposals, until November 1, for a torpedo boat; cost, \$90,000.

BUFFALO, N. Y.—The Businessmen's Association is organizing a company to develop the water-power of Niagara River for manufacturing purposes.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 30, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

THE MASSACHUSETTS INVESTIGATION OF WATER-SUPPLIES.

UNDER the provisions of an act of the Legislature, approved June 9, 1886, the State Board of Health of Massachusetts is charged with the oversight of all inland waters and water-supplies, with reference to their fitness for use or their liability to imperil the public health, and it is directed to cause examinations of the said waters to be made from time to time as it may deem expedient. To carry out this law the board has organized a system of investigation of the principal water-supplies of the State, which promises to be of great value, and the methods of which we commend to the attention of other State boards.

The first thing to be done is to obtain an exact account of the existing condition of the various public water-supplies of the State, and by this is meant, not the condition at a given hour or day, but the condition under different circumstances of temperature, season, storm, drought, or flood, etc. For this purpose the board has arranged to have samples of the different supplies forwarded each month throughout the year for analysis. Glass bottles of one gallon capacity are packed in open boxes and sent by express each month to the various towns and companies, with detailed instructions as to mode of collecting and forwarding samples. Arrangements have been made to have these samples chemically analyzed under the direction of Professor Drown, of the Massachusetts Institute of Technology, and by such a force that ten samples can be analyzed each day, so that all the public supplies in the State and the principal river-waters may be analyzed each month. Arrangements are also being made for expert biological investigations on the same waters. We print on another page the instructions for collecting samples and a copy of the certificate required with each sample. We also print the questions contained in a blank form circulated by the board to obtain information with regard to water-works throughout the State.

The results of an investigation thus conducted cannot fail to be of great interest and importance. No doubt the Board will take the necessary precautions to insure that the samples shall be what they purport to be, which must depend somewhat on the character and interests of those who gather them. Meantime we hope that the example thus set will be followed elsewhere, for there is no department of public hygiene in which we are in more need of a systematic, long-continued series of careful observations than in that of public water-supply.

IMPROVING THE NEW YORK CITY HALL.

MAYOR HEWITT, of New York, according to the *Evening Post*, has expressed some views in regard to the new public building which we should be sorry to see carried out. His plan, as reported, is to increase the room at the disposal of the city, not by the erection of a new building, but by additions to the City Hall, these additions to take the shape of wings and another story.

The building, with the exception of the north front, which is unfortunately of a different stone, is, architecturally speaking, the best of its kind in this country.

It is exceedingly well designed in a rather pure classic vein, and, with the exception of the Assay

Office, is about the only example of good work in that school in the country.

It is possible that lateral wings from the north-east and north-west corners, masking the unsightly brownstone, might be managed so as not to take away from the present excellent proportions of the Hall.

Even this, however, is highly problematical, as the proportion of length, breadth, and height in the present building is quite right. An additional story would ruin the only good example of its kind that we have. The building was designed as it stands, and is of such a character as not to admit of the superimposition of any kind of additional stories.

This fact, however, will probably have little weight with the powers that manage these things, since plans have been prepared for a mansard roof on the Custom-House, and an attic story was contemplated on the Sub-Treasury.

We have a good thing in the City Hall. Tampering with it will certainly not improve it and may work woeful injury.

MOUNT HOLLY'S WATER-SUPPLY.

THE town of Mount Holly, New Jersey, has experienced an outbreak of typhoid fever which began about the first of June, and has resulted in eighteen cases and four deaths. It is probable that the cause of this little epidemic was the pollution of the creek which supplies the town with water. The supposed source of pollution was the cesspool of a boarding-house three miles up the stream, in which boarding-house there were two or three cases of typhoid fever. The particulars of the outbreak have not been given with such detail as to make it possible to judge as to the probability of this theory; if it is correct the difficulty is to explain why more cases have not occurred.

This is, however, a matter of secondary importance. The fact that sewage has been discharged into the general water-supply of the town seems to be undoubted, and the folly of permitting this is the same whether it has thus far produced disease or not.

Is it still necessary that an outbreak of typhoid should occur to induce a town to look after the sources of possible contamination of its water-supply? How many towns are there in this country which keep up a careful and systematic inspection of their water-supplies in order to make sure that no sewage or other dangerous pollutions are discharged into them? We fear not many.

The water company of Mount Holly claims that it cannot be held responsible for the purity of the source from which it takes its supply, on the ground that it has no power to cleanse the stream. This plea is not a good or wise one. The company sells water; as a mere matter of commercial honesty it should furnish pure water, and it should know whether the water which it furnishes is contaminated or not.

It was the business of the water company, as well as of the authorities of Mount Holly, to know that there was a cesspool discharging into the stream, and if it had known it the pollution could have been easily stopped. The laws of New Jersey afford ample and prompt means for dealing with a nuisance of this kind; and in this case the carelessness and ignorance of those responsible for the condition of a public water-

supply have been brought to light. Let other town authorities and water companies take heed lest their shortcomings be also made unpleasantly conspicuous by a similar epidemic.

CONANICUT PARK FEVER OUTBREAK.

ANOTHER instance of criminal carelessness and ignorance has been brought to light in the matter of the drainage and water-supply of a summer resort—a condition of things for which the proprietors should be held pecuniarily responsible in damages for the sickness resulting, and criminally if fatal results ensue. Investigation at the Conanicut Park Hotel, near Providence, R. I., where an outbreak of fever resulted in an abandonment of the house by the guests, showed that the well was situated under the floor of a room adjoining the laundry; two earthen drains, with the usual leaky joints, passed within a few feet of this well, making a junction just beyond it, so that the well, with considerable ingenuity, was located just within the angle, in order that every possible facility might be af-

tified to by State health authorities, should be required by law to be conspicuously posted in each summer resort. There is now sufficient intelligence in these matters outside the keepers of such establishments to detect and cause the correction of any serious defects; publicity, therefore, would be an effective safeguard.

It is quite as important in these days that such information should be posted for the information of the public as that certificates of boiler inspections should be displayed on all steam vessels. Indeed, we believe polluted water destroys more lives than steam-boiler explosions.

PROVIDENCE SEWAGE DISPOSAL.

THE City Council of Providence has at last passed a resolution adopting the plan for the improved disposal of sewage and purification of the river and Cove proposed by the City Engineer, Mr. Samuel M. Gray, whose report on the subject was duly noticed in THE SANITARY ENGINEER AND CONSTRUCTION RECORD. The essential features of the plan are the collection

been lodged in jail on a charge of swindling, together with some people of his staff. The railway companies have kept aloof from the undertaking, and confidence in it has been lacking. To what extent American firms have exhibited we do not know, though we apprehend the main losers in the undertaking will be the contractors who put up the buildings.

A BILL has been brought into Parliament by Mr. Elton, entitled "A bill to provide for the registration and regulation of vans and other vehicles used as temporary dwellings," the essential feature of which is that the Local Government Board are to prepare regulations for registering such vehicles, for fixing the number, age, and sex of the people who may be allowed to dwell in each, and for promoting the cleanliness of and preventing the spread of infection by such vehicles.

It is a curious bit of legislation, and the fact that it should be considered as necessary in England will some day be commented on by the historian.

A RESIDENCE NEAR PHILADELPHIA, PA.—GEORGE T. PEARSON, ARCHITECT.

fording for its receiving the contents of these leaky drains, as will be seen by the sketch elsewhere in this issue. A removal of the floor revealed a mass of filth from the drains running into the well. Of course, the business of this hotel for this season is practically killed. The question, however, which is of importance, now is, How many other summer resorts have their wells or drinking-water cisterns in close proximity to drains now defective or likely to become so?

The Providence *Journal* says the Rhode Island State Board of Health has no funds to enable it to make the necessary inspections of such resorts. If this is true, it is to be hoped that such will not be the case another year, and as a measure of protection every State Board of Health should endeavor to secure legislative authority and funds to make such inspections, and also to prepare a plan showing the drainage system of all summer hotels, including location of wells, cisterns, and cesspools, all to be drawn to a scale. A copy of this plan, cer-

of the sewage at Field's point below the city, the level of delivery being 14 feet below high water; the raising the sewage of this point by pumping works to a height of about 28 feet; its treatment by a chemical process in precipitation tanks, and the discharge of the purified effluent into the river. It is to be presumed that the work will be commenced at once, and every one who knows the condition of the river in the city will certainly agree that it is full time that something was done to mitigate the dangerous nuisance which it now presents. We congratulate Mr. Gray on the endorsement thus given to his plans, and trust that he may have the pleasure in due time of carrying them out to completion.

THE PARIS RAILWAY APPLIANCE EXHIBITION FIZZLE.

ADVICES from Paris inform us that the International Exhibition of Railway Appliances is likely to prove a disastrous failure, if that result has not already been reached. We are informed that the promoter of the enterprise has

OUR SPECIAL ILLUSTRATION.

RESIDENCE OF C. W. NORTON, ALLSTON, MASS.

OUR special illustration is of the residence of Mr. C. W. Norton, at Allston, near Boston. It is of wood, stained shingles on walls and roof. In interior oak and stained ash, and stained white wood. Carved brick fire-place in library. This room fitted up with cases. Library hall and parlor ceiling finished with wooden ribs. Good quality colored glass in staircase windows. Cost, about \$16,000. Messrs. Hartwell & Richardson, of Boston, are the architects.

OUR VIGNETTE ILLUSTRATION.

THE subject of our vignette illustration this week shows a residence near Philadelphia, of which George T. Pearson is the architect.

OUR DETAIL SHEET.

OUR detail sheet this week shows a sketch of a summer house on the old Craddock estate, Medford, Mass. Architect unknown.

MODERN SEWER CONSTRUCTION AND SEWAGE DISPOSAL.

BY EDWARD S. PHILBRICK, MEM. AM. SOC. C. E.

No. VII.

(Continued from page 68.)

THE capacity of the Boston Main Drainage Works was based upon the following considerations. The whole area to be drained in the future within the basins of the Charles and Neponset rivers comprises about fifty-eight square miles. Of this area some forty six square miles might hereafter be drained by a high-level sewer, leaving some twelve square miles to be tributary to the low-level system, the construction of which was immediately called for. As the high-level sewer might not be needed for a considerable time, and in the meantime certain sections naturally tributary to it might be temporarily drained into the low-level system, an area of twenty square miles was assumed as that to be now provided for.

The population was assumed as $62\frac{1}{2}$ persons to the acre, making 800,000 in all, tributary to the main sewer. But in adjusting the sizes of the several intercepting sewers, branches of the main, a greater density of population was provided for than the above average. Seventy-five gallons, or ten cubic feet per day, was assumed to be contributed by each person. Since, during the day time, the flow is always greater than the average, the maximum flow was taken at one and a half times the average. These data give about 139 cubic feet per second of sewage to be provided for. To this was added 100 cubic feet per second of rain-water, to be admitted in time of storms, which would amount to somewhat less than one-fourth of an inch of rainfall per hour from the tributary surface. The sizes and inclinations of the several intercepting sewers were adjusted for carrying the above volumes of water and sewage while running half full.

This plan of using only one-half the capacity of the conduits by the maximum flow may at first appear extravagant, but good reasons appear for such provision—viz.: If the same sewers had been constructed of such size as to run full with the maximum flow, although they would have required much less material, the vertical depth of the flowing streams would have been some three feet more than under the conditions adopted, while the lateral expansion would have been correspondingly less. Such a plan would, therefore, have required an average of three feet greater depth of excavation, and three feet more lift at the pumps, while providing much less storage capacity in the sewers themselves for equalizing the duty of the pumps in time of storms, and avoiding the gorging of the conduits in the low-level districts after heavy rains.

The assumption of one-fourth of an inch per hour as the quantity of rain-water to be admitted was, of course, an arbitrary one, and taken merely as an average. The low-level districts must at times contribute much more than this, while the hill districts need not contribute any more storm-water than it is found convenient to receive, for the surplus can be allowed to discharge into the harbor through the old openings to any extent which experience shows to be advisable. After the first rush of rain-water has rinsed the streets in a violent rain-storm the flow from that source is comparatively harmless if allowed to flow into the harbor. This first rush from the hilly districts would have entered the main sewer and become partially distributed along its course before any great volume could have accumulated from the lower levels where the flow is more sluggish. As the apparatus devised and constructed to govern the admission of storm-water from the laterals into the intercepting sewer is generally automatically self-governing, depending upon the actual depth of water in the intercepting sewer at the time, and as the quantity of rain-water to be admitted at any point under any given level of water in the intercepting sewer is capable of change and adjustment to suit such circumstances as may arise from time to time, the admission of rain-water in any considerable quantity is evidently subject to detailed control, and need not be a subject of embarrassment for a long time to come if at all.

The lateral sewers which had been recently constructed

in the streets all about the city had been proportioned to carry a flow of rain-water of one inch per hour from the tributary surface. Although copious rains are on record in this neighborhood showing a rate of rainfall as high as two inches per hour for short periods, they seldom, if ever, continue at that rate for more than thirty minutes, or an hour at most, while the obstacles existing on the surface, even in paved streets, prevent the water from getting into the sewers at such times as rapidly as it falls. In fact, a considerable accumulation always occurs on the surfaces and along the gullies, which drains off after the fall from the clouds becomes more moderate, and without serious inconvenience.

Among the problems peculiar to the locality, which were presented in connection with the construction of the Boston intercepting sewers, was the following.

Considerable anxiety had been felt, and with a reasonable justification, that the level of the ground-water would be lowered throughout that part of the city which had been reclaimed from tidal flowage, consequent upon the construction of a system of sewers some twelve feet to eighteen feet below those formerly existing. That part of the city was all built upon spruce piles driven into the mud, and their tops had been cut off at a level of some five feet or more above low water.

If the ground-water should be permanently drained to a level below these pile-heads, they would be exposed to air which would enter the pores of the soil previously occupied by such water, and the piles would be subject to decay, endangering the stability of all the structures resting on them. In order to settle the question beyond a reasonable doubt, the following experiment was tried: A steam-pump was set at work in one of the largest of the old sewers—viz., in Berkeley Street—near its mouth, to keep the sewer nearly empty throughout all stages of the tides, as it would be after the construction of the proposed intercepting sewer. Previous to starting this pump twenty pipes were driven into the soil in the neighborhood, some close to the sewer, others at a few hundred feet distance and still others more remote. The level of the ground-water was carefully noted in these pipes before pumping and twice a day during the experiment. The result is interesting, and is thus stated by Mr. Clarke: "It was found that the surface of the soil-water was nearly level over the whole Back Bay district, averaging $7\frac{1}{2}$ feet above mean low water, and its height, while slightly affected by local contours of the surface, was independent of the sewers in its vicinity. For instance, the water in the vicinity of the Dartmouth Street sewer was at the same level as that near the Berkeley Street sewer, although the latter sewer is two feet lower than the former. Also, it was found that the soil water rose and fell, responding quickly to any rain or melting of snow (the extreme rise due to four inches of surface-water being one foot), and that the variation was nearly uniform over the entire district. Finally, it appeared that the pumping, which continued fifty-three days, affected but slightly, and that only within one hundred feet of the sewer, the soil-water in the vicinity of Berkeley Street. At the close of the experiment, the sewer resuming its former conditions, the soil-water in its immediate vicinity rose from an inch to an inch and one-half, and thereafter fluctuated in union with the water in other localities."

The results here recorded might have been quite different if the sewer in Berkeley Street had been less thoroughly constructed. It is well known that some brick conduits have acted as ground-drains to a considerable extent. The experiment above quoted shows conclusively that where proper precautions are taken in the choice of materials and the character of the workmanship, the ground-water can be practically excluded from such structures.

I think the Boston system, which I have now described pretty thoroughly (except as to its pumping and delivery apparatus) exemplifies pretty well how a separate and combined system can be combined, so to speak—i. e., how it can work for sewage and rain-water combined up to the limit of its capacity, and then discharge its surplus at convenient points, subject to automatic control, and still give satisfactory results.

Whenever the city shall grow in the future to a point when the capacity of the present system will be fully needed for sewage alone in any one or more districts, then the system provides for the overflow of the rain-water, so that the intercepting sewers and all the new works constructed for the ultimate disposal of the sewage will be unencumbered with rain-water, except such as may come from the small area where the grade of the streets is very low, and even there the grade may eventually be raised. Each district then will have a combined system of sewerage for the collection of the sewage as well as rain-water, while these will be separately disposed of as a general rule in all heavy rains.

(TO BE CONTINUED)

THE DRIVEN WELL SYSTEM AS A SOURCE OF OR A MEANS OF OBTAINING A WATER-SUPPLY.*

IN considering the question of the value of the driven well system as a source of or a means of obtaining a water-supply, one has to practically consider the whole question of ground-water or subterranean supply as obtained by driven, bored, artesian, or open wells, for the general laws governing each are substantially the same, and by various modifications they often operate together. Thus a driven well by passing through an impervious stratum becomes an artesian or flowing well, or an artesian well may, by the driving of other wells, cease to flow, and then be called open or driven. The definition of a driven well is commonly given as one formed by driving or forcing a wrought-iron or galvanized-iron tube down into the stratum from which the water is to be taken. These pipes are generally from $1\frac{1}{2}$ inches to 8 inches diameter, and may or may not be furnished at the lower end with a wrought-iron or steel point. Above this point, the pipes are perforated for some distance with holes to admit the water.

"It is claimed that Nelson W. Greene, a colonel of New York volunteers in the late war, to give the men of his command pure water, devised in his own mind a method by which this could be done, and a test was successfully made in 1861 on the fairground at Courtland, N. Y., at the expense of one Graham, who had a contract to supply food and other necessary articles to the soldiers in camp there.

"This well was used generally by the men in camp and by Graham and his employees. In 1868, Greene procured a patent for this invention, and in 1871 had a reissue thereof, in which he claimed as his invention the creation of a vacuum in the lining of the well for the purpose of using the pressure of the atmosphere to bring up the water."

The claim was also made and allowed for the construction of a tube well without the removal of the material.

The issuing of this patent has been the source of a large number of lawsuits, and the payment of large sums of money as royalty by individuals and corporations when the sum at stake would not warrant a suit.

In the suit *Andrew vs. Hovey*, brought in the United States Circuit Court for the Northern District of Iowa, it was shown that in 1851, in Independence, Mo., a tube was driven in the water-bearing stratum, and by a pump attached to the tube, water was drawn through it, apparently in inexhaustible quantity.

It was further shown that in 1849 and 1850, E. W. Purdy, a well-maker in Milwaukee, Wis., drove a number of these wells, some of them to the depth of sixty to one hundred feet. Another case in our neighborhood has come to my notice, wherein driven wells of this character were in use previous to its inception by Col. Greene, the details of which may be of interest to the association.

Calvin Horton, of East Somerville, Mass., was employed in 1851 in putting in deep-well pumps. His attention was called to an open well which had become filled up with sand and yet a free flow of water could be raised with the pump, about the end of the suction of which a metallic gauze had been wound. This led to the question of the necessity of constructing open wells. In order to test its practicability, he claimed that in June, 1859, he drove a wrought-iron pipe one and one-half inches in diameter, with one end perforated with small holes for a distance of about two feet. In order more readily to drive this in, and to protect the perforations from injury in the passage of the pipe through the ground, he had a wrought-iron point and sleeve made, extending from the end of the pipe to a point above the perforations. The pipe was driven by inserting an iron drive-rod inside of the pipe and resting on the bottom of the sleeve or point. The pipe was driven through twenty-eight feet of clay into a stratum of sand and sea-washed gravel, making a total length of thirty-six feet. The point and sleeve was then driven ahead of, or away from the pipe. Upon attaching a pump to the pipe and cleaning the end of the pipe from fine sand which had washed in, he obtained a free flowing well, yielding, at a point three feet above the surface of the ground, eighty-five barrels of water in twenty-four hours. The water rose in the pipe to the height of seven feet above the ground. Early in the year 1861, he claims to have put in his first driven well for which he received

* A paper by Albert F. Noyes, City Engineer, Newton, Mass., published in the Journal of the New England Water-Works Association for June, 1887.

compensation. It was put in for Charles Linehan, of Cambridge, and was located on land about ten feet lower in level and three-fourths of a mile distant from the first well, and upon ground about six feet above high-tide level. The tube was sixty-seven feet deep, and was driven through fifty-four feet of marsh-mud and clay and into a stratum of sand and gravel. The water flowed freely from the well, a pump was attached to it, and the water was used for domestic purposes.

It may be of interest to note here that the draft upon the second well caused the flow from the first to cease, but upon the cutting off of the pipe of the first well to a point within eighteen inches of the ground, the flow was restored.

Early in 1863, Mr. Horton put in a 2-inch tube well for Burr Brown at the Hingham Dye House. This well was forced through a yellow, clayey quicksand about forty feet, and into and through about eight feet of gravel, and furnished, by constant pumping, about ten thousand gallons of water per twenty-four hours.

In 1876, the well being insufficient for the increased demand upon it, two more tubes were put down. They were ganged to or connected to the first, and the three were connected by a 2½-inch suction-pipe to a steam-pump. The yield from these wells continues substantially as when first put down, and, with the exception of the first well, they are in continual use to-day.

The introduction of water for the public supply rendered the first well of but little value, and it was recently connected with the public sewer, and when last seen was flowing as at first.

During the years 1865 and 1867, he put down a number of wells for the Boston and Fitchburg Railroad; at the Brighton cattle-yards a series of seven 1½-inch tubes were put down thirty feet deep and connected. At the Union cattle-yards, at Watertown, a set of nine 1½-inch tubes was driven in the gravel and sand deposit twenty-seven to thirty feet deep. These were later connected with eighteen additional 1½-inch tubes, and connected by a 4-inch suction-pipe with a steam-pump.

The Shaw patent, so-called, for ganging of driven wells was issued in April, 1870, but from the above it would seem that the scheme had been in public use some years previous.

Over 150 patents have been allowed upon various devices for well points to prevent the inflowing of the finer material into the well. As they consist for the most part in devices or ideas for attaching fine wire or perforated gauze about the perforated pipe, it seems to me they can be of but little permanent value, the space between them and the pipe soon filling up with rust, and these well points with outside covering are, so far as I can learn, the only cause of diminished yield, other than that caused by the driving of additional pipes within the area influenced by the well. Better results are usually obtained by driving an opened end pipe having attached at its lower end a steel shoe similar to a common pipe-coupling. This is first forced into the ground and a small hollow rod or pipe, to which a steel point is welded, has small holes drilled into it, so that a jet of water forced into the rod will discharge into the holes and play on the point of the drill. This loosens the material about the point of the tube and a large part is forced, by overflow, out from the pipe. The wash-pipe is then removed, the tube driven until checked by the resistance of the earth, when the process of cleaning out is renewed until the level from which it is desired to take the water is reached.

When a number of water-bearing strata of coarse material are encountered, additional pieces of perforated pipe may be advantageously inserted, thus materially increasing the yield, and diminishing the velocity of the water flowing into the pipe at any one point, thus preventing a tendency towards an inflowing of the finer material.

Precaution should be taken, where a number of pipes are to be connected, not to place any of the perforated pipes at a level above that affected by the suction from the pump, this level limiting the depth or level from which the ground water can be drawn.

Where it is desired to determine the character of the strata through which the pipe is being driven, a sand-pump may be used with better results than with the driving-rod.

This is usually a metallic cylinder of a little less diameter than the inside of the bore of the well-tube, having a clap-valve at one end and a handle at the other which acts as a guide to a rod to which is attached a washer closely

fitting the inside of the cylinder. The rod is worked up and down, acting as a suction-rod to a pump, thus filling the cylinder or pump with the material which is withdrawn. The process is continued until the well is cleaned out; after this the driving continues.

The driving of small tubes is usually effected by sledges striking upon an iron-bound wooden block, or by a small, portable pile-driver, or by a weight or monkey running over a portion of the tube and striking against an iron clamp. This weight may be raised by a rope passing over a sheave or sheaves attached to a tripod, or clamped to the upper portion of the tube.

The larger tubes are driven by pile-drivers with large, heavy, wooden hammers attached to a rope which passes over a sheave at the top of a high derrick and operated with steam-power.

In driving, great care must be taken to keep the joints of the pipe well screwed up, for the jar, from driving, has a constant tendency to unscrew the sections of the pipe.

A process has recently come to my attention for clearing the well-tubes, known as the Wagner Steamed Well Process, and is a substitute for the water-jet process. The excavation and the removal of the material is effected by the injection of a jet of steam, under a high pressure, at the end of the well-tube. It is stated that all of the finer material is forced out from about the tube, and that the cleansing power of the steam is greater than that by the water-jet, and its influence is felt at a greater distance than by any other process. It is also claimed that excavations have shown all of the finer material to have been washed out for a distance of at least twelve feet.

In order to fully determine the relative value of the two methods of well-driving, five wells have been driven at Franklin, Ohio, with a light pile-driver and sand-bucketed in the usual manner, and one well by the steamed-well process, and each of the wells is to be tested separately.

It might be well to consider here the source from which wells derive their supply and the natural laws governing them. It will undoubtedly be conceded by all that the source of all water-supply is primarily that derived from the clouds or atmosphere, in the shape of rain or snow, a portion of which sinks into the earth, and where the surface deposit is gravel, or other porous material, overlying some impervious stratum or rock, the water collects and constitutes the ground-water of the locality. J. T. Fanning, in his treatise on water-supply engineering, says: "Respecting the porosity and absorptive qualities of different earths, it may be observed that clean silicious sand, when thrown loosely together, has voids between its particles equal to nearly one-third its volume of cubical measure; that is, if a tank of one cubic yard capacity is filled with quartzoid sand, then from thirty to thirty-five per cent. of a cubic yard of water can be poured into the tank with the sand without overflowing.

"Gravel, consisting of small water-worn stones or pebbles, intermixed with grains of sand, has ordinarily twenty to twenty-five per cent. of voids.

"Marl, consisting of limestone grains, clay, and silicious sands, has from ten to twenty per cent. of voids, according to the proportions and thoroughness of admixture of its constituents.

"Pure clays have innumerable interstices, not easily measured, but capable of absorbing, after thorough drying, from eight to fifteen per cent. of an equal volume of water.

"The water contained in clays is so fully subject to laws of molecular attraction, owing to the minuteness of the individual interstices, that great pressure is required to give it appreciable flow.

"Water flows with some degree of freedom through sandstones, limestones, and chalks, according to their textures, and they are capable of absorbing from ten to twenty per cent. of their equal volumes of water.

"The primary and secondary formations, according to geological classification, as for instance, granites, serpentine, trapeans, gneisses, micascates, and argillaceous schists, are classed as impervious rocks, as are, usually, the several strata of pure clays that have been subjected to great superincumbent weight.

"The crevices in the impervious rocks, resulting from rupture, however, gather and lead away, as natural drains, large volumes of the water of percolation.

"The free flow of the percolating water toward wells or springs, is limited and controlled, not only by the porosity of the strata which it enters, but also by their inclination, curvature, and continuous extent, and by the imperviousness of the underlying stratum, or plutonic rock."

It is estimated that in a free, open soil, above one fourth of the rainfall percolates into or is absorbed in the ground, and the balance is taken up and evaporated by vegetation, or flows off over the surface to the streams and ponds. As the laws of gravity govern the flow of water through the soil in the same way as in streams, retarded only by the frictional resistance of the material through which it passes, the more compact the material the greater head required to force itself to an outlet, hence the reason for the great difference in the level of the ground water, even in localities of small area.

(TO BE CONTINUED.)

ARCHITECTURAL LEAGUE OF NEW YORK.

MESSRS. F. A. WRIGHT, E. H. Clark, and John P. Riley, on behalf of the Committee on Current Work, have issued the following circular:

The programme for the second midsummer outing has been arranged as follows:

Leave New York August 18 by Fall River boat at 6:15 P. M. for Newport. In the early morning, after coffee, there will be a trip to the beach in carriages, which will be at the service of the party all day. After a bath in the surf, breakfast will be taken at the Aquidneck. The balance of the morning will be spent in a drive to some of the best houses in Newport, and an examination of the interiors of a few of them, including Mr. Cornelius Vanderbilt's and Mr. Robert Goelet's houses. Lunch will be had at the Casino, and the party will take the afternoon train for Boston. The headquarters in Boston will be at the Parker House, the dinner there on the evening of the 19th being a regular League dinner. On this occasion, beside the Boston members of the League, there will be present invited guests from the leading members of the profession in Boston. On the morning of the 20th there will be a drive around Boston and out to Brookline, with inspection of noted exteriors and interiors. About noon the party will take train to North Easton, where all the famous Richardson buildings, including the Ames gate lodge, will be inspected from without and within, through the courtesy of Mr. Ames. The return to New York will be by Fall River boat on the evening of the 20th.

The entire necessary expenses of the trip to each member, including passage both ways, staterooms, hotel bills, carriage hire, all meals, etc., will be in the neighborhood of twenty-five dollars.

In order that the committee may conclude proper arrangements it is absolutely necessary that acceptances for the above trip should be received by F. A. Wright, 140 Broadway, New York, on or before August 9.

Charles I. Berg, 152 Fifth Avenue, New York, is secretary of the League.

The third annual exhibition of architectural drawings, under the auspices of the Architectural League, will be given in the new Ortgies' Gallery, Fifth Avenue, next the A. T. Stewart house, during the last two weeks of December and the first week in January.

It is the purpose of the League to make this year's exhibition much more complete than any former one.

In furtherance of this it is proposed to set aside rooms for the exhibition of the allied arts—viz., sculpture and decorative painting, stained glass, textile fabrics, embroidery, etc. It is designed that the exhibition shall represent, as far as possible, work of the current year.

The first announcement of the League will be issued in a few days and will be followed by a prospectus stating the kind and class of work that will be received, the name of the jurors, and other information for intending exhibitors.

The twenty-first annual convention of the American Institute of Architects will meet in Chicago on October 19, 1887. The Committee of Arrangements is A. J. Bloor, W. L. B. Jenney, E. H. Littell, and Henry Lord Gay.

THE NEWARK, N. J., SEWERAGE SCHEME.

MESSRS. A. FTELEY and W. E. Worthen, the engineers who were engaged by the Sewer Committee of the Common Council of Newark, N. J., to examine and report on the intercepting sewer recently constructed, have made a lengthy report in which they state that "the system of sewerage, as far as constructed, has been well carried out, works successfully, and will, when properly connected with the old sewers, abate the nuisance created by their discharge on the meadows."

A full illustrated description of this important work appeared in the issues of THE SANITARY ENGINEER and CONSTRUCTION RECORD, dated May 7 and 14, pages 600 and 628, Volume XV.

The Joseph Weiss electro-motor has been applied to the Jersey City and Bergen Horse Railroad.

The Common Council of Milwaukee have finally determined to dispose of the garbage of the city by cremation, which is a sensible decision under the circumstances.

PAVEMENTS AND STREET RAILROADS.

No. IX.

(Continued from page 236.)

ASPHALT AND CONCRETE FOOT-PAVEMENTS.*

THE object of this paper is to draw the criticism of the members of the association upon the experiments and experience of the writer and others, on asphalt and concrete as materials for foot-pavements, and, if possible, to induce others to carry forward experiments with a view to perfecting the use of these pavements.

The writer desires to place in the forefront of the paper the fact that the credit of the Hornsey experiments herein referred to is due to Mr. T. de Courcey Meade, A. M. I. C. E., who most readily placed them at the disposal of the writer for this paper; and also his obligations to the French Asphalt Company, the Val de Travers Asphalt Company, the Imperial Stone Company, and others, for the information given. Every pavement described has been personally examined by the writer, and the exact locality of each is stated, so that any one may examine them for his own information.

Asphalt, properly so called, is a natural compound of carbonate of lime and bitumen, and is found principally in volcanic areas. Men of erudition have asserted that it was the "pitch" used to make the Ark watertight, and that it was the "slime" used as a mortar in the construction of the Tower of Babel and the city of Babylon. If such ancient uses of this substance are facts, its virtues were strangely lost sight of in the intervening centuries, for it is not till 1700, A. D., that its use became common. It was then used for the purpose of extracting "balm" from its beds, which was used for medical purposes and was credited with superior healing powers. The origin of the asphalt beds has given rise to much speculation. A Swiss geologist has made an effort to explain their formation in a striking manner. Starting from the observation that all organic matter exudes bitumen in decomposing, he suggests that the beds are the remains of huge banks of oysters, the shells of which furnished the carbonate of lime, and the oysters themselves furnished the bitumen. As the asphalt beds are in some cases 27 feet thick, and their areas are measured by square miles, it is evident that oysters were plentiful in those days.

The works of the French Asphalt Company are described, as that company has executed all the asphalt works in Chelsea; but the writer wishes to say that the Val de Travers Company, Claridge's Asphalt Company, and others do equally good work.

The mines of the French Asphalt Company, from which their English supply of asphalt is obtained, are situated at St. Ambroix, in the south of France. The asphalt is in seams, which lie nearly horizontal, and which have their faults, bends, etc., like coal seams. The bed and roof of the seams are of pure carbonate of lime rock, presumably the same as that of which the asphalt is largely composed. The seams vary from three to five feet in thickness, and are worked by drifts from the outcrop on the hillside. The rock is mined by blasting and hand labor, and comes from the drifts in pieces measuring one cubic foot and downwards. The asphalt then has a very dark chocolate color, and appears to be a tough homogeneous substance, with striations of white matter running through it parallel to its natural bed, which are probably narrow seams of carbonate of lime. When it is exposed to a hot sun the surface will glisten with small fatty beads of bitumen, but at ordinary temperatures it is dry. After exposure to the air the surface turns a dull white color, owing to the evaporation of the bitumen; but this change is only skin deep. The rock is conveyed to Marseilles just as it leaves the mine, and is shipped to England. Formerly the beds of asphalt yielded a supply of natural bitumen, but twenty years ago the supply ceased, owing, it is believed, to some widespread cause, as several mines were affected in the same way at that time.

At the depot of the company at Stratford, the rock as delivered by ship is passed through a crusher which acts like a Blake's crusher, save that the solid jaw is replaced by a series of knives, and by which it is reduced to pieces not exceeding three inches in length. The pieces are poured into a Carr's disintegrator, which has spindles revolving 800 times a minute in opposite directions, and which reduces the asphalt to powder. The powder is screened through a rotary cylindrical sieve (144 to the square inch) and is then stored in sacks. The asphalt varies in the proportion of bitumen it contains. The richer parts are ground and stored separately from the other, and are afterwards mixed in suitable proportions for the particular use to which they are to be applied.

The following are analyses of asphalt rock of average richness at this stage:

	No. 1 Sample.	No. 2 Sample.	Average.
Bitumen.....	10.70	10.60	10.65
Carbonate of lime.....	88.05	88.15	88.10
Silica.....	0.55	0.40	0.48
Alumina.....	0.10	0.15	0.12
Peroxide of iron.....	0.20	0.10	0.15
Moisture.....	0.40	0.60	0.50
	100.00	100.00	100.00

* A paper by George R. Strachan, A. M., Inst. C. E., of Chelsea, London, S. W., read at the annual meeting of the Association of Municipal and Sanitary Engineers at Leicester, July, 1887.

When the asphalt is about to be used, the powder is poured into revolving roasters, and roasted for three hours at a temperature of 280° Fah., during which operation the moisture is driven off. As the asphalt chars at 320° Fah., care has to be exercised as to the proper temperature. It is loaded direct from the roasters into carts lined with sheet-iron, covered with hemp cloths, and thus protected it retains its heat till it is taken to the site where it has to be laid. It is carried from the carts in baskets, spread over the foundation by means of a rake and rammed solid by a series of blows from heavy heated rammers. The surface is ironed by a heated iron, which draws bitumen to the top, and in a few hours it is ready for traffic. This form of asphalt is known as compressed asphalt, and is the form always used for carriage-ways and frequently for footways.

The other form of asphalt is known as mastic asphalt, and is a manufactured compound made up of natural asphalt, artificial bitumen, and grit. The asphalt is reduced to a powder as described. The artificial bitumen is used because of the scanty supply of natural bitumen. Its principal component is Trinidad pitch, to which is added from five to seven per cent. of shale oil. The mixture is boiled for twenty-four hours; the top liquid is ladled out, and is the artificial bitumen. It is a soft, viscous, black substance which softens under the sun's rays. Its quality is tested by taking a piece between the fingers and drawing it out to a string; if it does not snap until drawn out very fine it is of good quality. The grit is obtained from Bridport, is wholly composed of flint, very clean, and the pieces do not exceed $\frac{1}{8}$ -inch in size. The mastic asphalt is prepared as follows: From five to seven per cent. of artificial bitumen, from 20 to 30 per cent. of grit, and the balance in powdered asphalt are placed in a covered caldron and heated for four or five hours. The mixture liquefies at 280° Fah. to 300° Fah. If it is to be used near the works (within 10 miles), it is run into locomobiles (boilers on wheels), with a fire under them, and drawn to the site. When it is used, it should be hot enough to vaporize a drop of water. It is carried in pails and spread over the foundation by means of a float. Silver sand is then spread sparingly over the surface and rubbed in by floats. In six hours the footway is ready for traffic. One ton of asphalt covers 20 square yards when laid one inch thick.

When mastic asphalt is to be laid at a distance from the works instead of running it from the caldrons into the locomobiles, it is run into molds, and molded into flat cylindrical pieces weighing about 56 pounds each. These are taken to the site, placed in a caldron, from 3 to 4 per cent. of additional bitumen added to make up for the loss by evaporation, and heat applied to reduce it to a liquid condition. The laying is then performed in the same manner as before described.

This description may be taken as applicable to the method adopted by the Val de Travers Company, with a few variations in the proportions used. The following analyses of asphalts are of interest, as they are those of rocks of average richness:

	Val de Travers Co.	French Asphalt Co.
Bitumen.....	9.75	10.65
Carbonate of lime, etc.	89.75	88.85
Moisture.....	.50	.50
	100.00	100.00

The following analyses, in a different form, were placed at the writer's disposal by Mr. Meade:

	VAL DE TRAVERS.		FRENCH ASPHALT CO.	
	Rock.	From Cheap-side.	From Hornsey Lane.	From Crescent Road.
Silica.....	0.6	0.5	0.3	0.4
Volatile organic matters (tar, oils, etc.).....	5.8	5.8	6.5	6.0
Non-volatile organic matters.....	13.0	9.8	13.6	16.9
Lime, etc.....	80.6	83.9	79.6	76.7
	100.0	100.0	100.0	100.0

This detailed description and the numerous analyses of good asphalts have been given, so that spurious asphalts may be avoided.

In Chelsea there are 16½ miles of footways paved with mastic asphalt, having an area of 68,290 square yards. On the Queen's Park Estate there are 41,500 square yards, which have been laid five years, and which are now in good condition, not having cost one penny for repairs. In King's Road, at Walpole Street, a length has been laid for seven years. The foot traffic over it is 7,500 persons in eighteen hours. At the end of the first five years it was cut open, and the wear was found to be such as had reduced the thickness to a spare $\frac{1}{4}$ of an inch, the original thickness being $\frac{3}{4}$ inch full. On the east side of New Bond Street a length of mastic asphalt was laid thirteen years ago between Oxford Street and Conduit Street, the thickness being $\frac{3}{4}$ of an inch. The asphalt is now wearing through on to the concrete in the line of traffic at the forecourt line. The cost for repairs has been so trifling that it may be neg-

lected. In this case the concrete foundation is as sound as before, and all that is necessary to restore the footway is to relay the asphalt at about two-thirds of the original cost, when the pavement will be good for another thirteen years. As the traffic here is very severe and the footway narrow, it is reliable evidence of the durability of asphalt.

The foundation for the asphalt footway is made with 3 inches of Portland cement concrete (6 to 1) of very good quality. The surface is smoothed with the shovel, and four days are allowed for drying. The concrete has been laid hitherto without any joints. The mastic asphalt is floated over the surface, and the path is then completed. Mastic asphalt does not show any cracks on the surface. The concrete foundation, when the asphalt is removed, shows the irregular, tree-like cracks all along its length, branching from the kerb to the back line, but the elasticity of the mastic asphalt is sufficient to resist the tearing action of the concrete as it contracts.

A study of the asphalt question resolves itself principally into a study of the movements of concrete when laid in long lengths, narrow widths, and small thicknesses. The writer inclines to the opinion that concrete has in itself a small power of contraction, apart from any considerations of temperature. The experiments of Dyckerhoff, which show that neat cement (slow setting) had an average expansive power over twelve months of .0734 per cent., and quick-setting cements of .2019 per cent., and that concrete (3 to 1, sand) had an expansive power of .0264 per cent. (slow-setting) and .0320 per cent. (quick-setting), seem to show the contrary to be the case. The writer laid down a length of concrete (6 to 1, ballast) 52 feet long, 12 inches wide and 3 inches thick, under a shed which had an open front, but so that the sun did not touch the concrete. The strip was laid on sand so as to give it freedom of movement. Another strip 26 feet long, of the same width and thickness (3 to 1, pebbles), and a third of the same dimensions (3 to 1, sand) were also laid under the same conditions. The only movement discernible, at the end of one month, was a slight contraction in length in all the samples. The uniform experience of concretes under asphalt is that cracks occur, which would tend to show that contraction and not expansion is the rule. At the same time, the writer has experience that concretes do expand, but this he attributes to the action of temperature. It is no uncommon thing to see the surface of an asphalt path raised crosswise in an irregular line, as though a small tree root was under it. In every case where the asphalt has been uncovered at these points by the writer, he has found the concrete crushed and the concrete on the falling level thrusting itself under the concrete on the rising level. This effect is most marked on hot days. In January last the writer laid some thousands of feet of asphalt path in St. Luke's Gardens, Chelsea. The sun is on it all day, and during the hot weather at the beginning of June, the number and size of these raised lines was astonishing. Shortly after midday they were most pronounced, and towards night they were less prominent. As a further evidence of the expansion of concrete under the sun's rays the streets in the city can be named. The footway and carriageway are in asphalt on concrete. The expansion of the concrete in the carriageway presses the kerb at the bottom; the expansion of the concrete in the footway presses the kerb at the top on the opposite side, and the two have tilted up the kerb in a marked manner. The writer has on a hot day taken up asphalt on a footway and has found the heat much greater under the asphalt than on the surface. In order to avoid the expansion showing itself in footways the concrete should be laid in sections, and the joints between them filled with some compressible substance.

Compressed asphalt has about one-third longer life than mastic asphalt under the same conditions. The cost is the same, but the use of compressed asphalt for this purpose has not been universally followed by reason of the cracks that appear on its surface. The cracks do not tend to spread under traffic, nor does the asphalt wear more at these parts than at others. They are unsightly, however. It is found that these cracks are exactly of the shape and in the position of the cracks in the concrete foundation. Compressed asphalt has no elasticity in itself, and when subjected to the contracting force of the concrete it is torn through. It is an admirable tell-tale of the movements of the concrete. Much ingenuity has been displayed in endeavors to avoid the cracks. The first step was to localize them. This was done by laying the concrete in 12-foot bays and in alternate bays, and filling up the screed space with fine concrete. The contraction then showed its effects at these places, with a result that a series of regular straight cracks appeared instead of the irregular tree-like cracks when the concrete was laid in one piece. These effects can be seen at many places in London without specifying any particular place. Having localized the cracks, an experiment was made at Hornsey to avoid them. A strip of bituminous felt six inches in width and $\frac{3}{4}$ -inch thick was placed on the concrete over the whole length of the screed mark. This felt has much elasticity, and the object of the experiment was to ascertain whether it would take up the contracting movement of the concrete and absorb it. The length is laid at Crouch Hall Road, between Coolhurst Road and Clifton Road. The result has been that instead of one crack at each screed mark there are two, one on each side of the narrow strip of felt. It is evident that the concrete in contracting compresses the asphalt longitudinally, and that the cracks appear at the points where the opposing motions meet; and as the strip of felt represented a narrow area which was free from these forces, a crack appeared on each side where the forces took effect.

STATE BOARD OF HEALTH OF MASSACHUSETTS.

INSTRUCTIONS FOR COLLECTING SAMPLES OF WATER FOR ANALYSIS.

1st.—*From a Water-Tap.* The water should run freely from the tap for a few minutes before it is collected. The bottle is then to be placed directly under the tap, and rinsed out with water three times, pouring out the water completely each time. It is then again to be placed under the tap and filled to overflowing, and then a small quantity poured out so that there shall be left an air-space under the stopper of about half an inch. The stopper must be rinsed off with the flowing water, and inserted into the bottle while still wet, and secured by tying over it a clean piece of cotton cloth. The ends of string must be sealed on the top of the stopper. Under no circumstances must the inside of the neck of the bottle or the stem of the stopper be touched by the hand or wiped with a cloth.

2d.—*From a Stream, Pond, or Reservoir.* The bottle and stopper should be rinsed with the water, if this can be done without stirring up the sediment on the bottom. The bottle, with the stopper in place, should then be entirely submerged in the water, and the stopper taken out at a distance of six to twelve inches below the surface. When the bottle is full, the stopper is replaced below the surface, and finally secured as above. It will be found convenient in taking samples in this way to have the bottle weighted, so that it will sink below the surface. It is important that the sample should be obtained free from the sediment on the bottom of a stream, and from the scum on the surface. If a stream should not be deep enough to admit of this method of taking a sample, the water must be dipped up with an absolutely clean vessel and poured into the bottle after it has been rinsed.

The sample of water should be collected immediately before shipping by express, so that as little time as possible shall intervene between the collecting the sample and its analysis in Boston.

The accompanying "certificate" must be filled out carefully and enclosed in the envelope shipping tag. By the order of the

STATE BOARD OF HEALTH OF MASSACHUSETTS,
S. W. ABBOTT, Secretary.

CERTIFICATE

Accompanying a Sample of Water to be enclosed in the envelope tag addressed to the State Board of Health, Boston.

SAMPLE OF WATER.

From.....(Name of city or town.) Collected and sealed by.....(Name and address of collector.) Collected from.....(State whether the water is from a tap, or from stream, pond, reservoir or other sources.) Collected on.....(Give day, date, and hour of day.) Shipped by..... Express.....(Give date and hour of day.)

REMARKS.—In case there are any abnormal or unusual conditions existing in the source of the water mention the facts. As for instance, if the streams or ponds are swollen by recent heavy rains; or are unusually low in consequence of prolonged drought; or if there is a great deal of vegetable growth in or on the surface of the water. Write on the other side of this Certificate.

COMMONWEALTH OF MASSACHUSETTS.
OFFICE OF STATE BOARD OF HEALTH,
13 BEACON STREET, BOSTON, May 23, 1887.

To.....

The State Board of Health intend to make monthly analyses for the ensuing year of waters used for domestic supplies within the State, and in connection therewith desire to obtain general information respecting the several water-supplies. They therefore request that you will send such printed information as you can; particularly reports describing the construction of your works, the occurrence of any unusual tastes, or growths of vegetation in or upon the water, or any general disease affecting the fish in the streams, ponds, and reservoirs.

An answer is requested to such of the questions in the accompanying blank as are applicable to your works.

The library of the board now contains the reports mentioned below.

Respectfully yours,
F. P. STEARNS,
Engineer State Board of Health.

COMMONWEALTH OF MASSACHUSETTS.

STATE BOARD OF HEALTH.

Please fill out such portions of this blank as are applicable to your works, and forward to F. P. Stearns, Engineer, State Board of Health, 13 Beacon Street, Boston.

Some of the blanks have been filled from information now in the possession of the Board: Please correct if wrong.

- DATE..... 188..
1. Name of city or town.....
 2. Population, 1885.....
 3. Date when works were built. (If not all built at one time, state what additions were made, and when.).....
 4. By whom are works owned?.....
 5. Source or sources of water-supply.....
 6. Area of water-shed supplying such source or sources.....
 7. General geological and topographical character of the water-shed.....
 8. Mode of supply, whether by gravity or pumping, and whether distributing reservoir or tank is used.....
 9. General description of storage and distributing reservoirs,—natural or artificial, how constructed, area of water surface, capacity, character of bottom, amount of shallow flowage, etc.....
 10. Does all water pumped go through the distributing reservoir or tank?.....
 11. What portion of the water pumped goes into the distributing reservoir?.....
 12. Whether or not the water is delivered into the distributing reservoir at one side and drawn out at the other.....
 13. Number, kind, size, and depth of wells used as sources of water-supply.....
 14. Describe filter-galleries or basins, and connections, if any, with stream, pond, or reservoir.....
 15. Daily average capacity of works in dry year.....
 16. Daily average consumption.....
 17. Number of persons using the water.....
 18. Is water supplied to any one outside of your town or city?.....
 19. Material of distributing mains.....
 20. Material of service pipes.....
 21. Does the water-supply receive sewage, drainage from factories (ment oning kind), or other pollutions?.....
 22. If there have been any bad tastes in the water, or excess of vegetable growth, or if the fish have been generally affected, and such occurrences are not fully described in printed reports, please describe the same and the remedy adopted, if any.....
 23. Have analyses of water from the present source been made?..... By whom?..... When?..... If not given in printed reports, please furnish copy of same.....
 24. Have records of the temperature of the water been taken in the past?..... If not printed, will you furnish copies if blanks are sent?.....
 25. Will you keep records of the temperature of water in the future, if a thermometer and blanks are furnished?.....
 26. Will you furnish samples of water for analysis each month, and forward at stated times by express, if bottles are supplied?.....
 27. To whom shall future correspondence be addressed?.....
 28. Name and address of collector of samples.....
 29. Name of Express Co.....
 30. Name of person furnishing this information.....

IMPORTANCE OF APPLIED ARTS AND THEIR RELATION TO COMMON LIFE.

We abstract the following from a paper on this subject, read by Mr. Walter Crane, before the Society of Arts, London, and printed in the *Journal*.

Under a commercial system of production and exchange, all art has been rigidly divided into classes, like the society it reflects. Since we have to sell it across the counter, as it were, we must take the weights and scales to it; we must apply to an article of commerce the tests and standards of commerce. Thus, we have divided beauty and use, and made them up in separate parcels; or, perhaps, having reduced both to powder, we try a conscious blend of the two to suit average tastes. We have the arts all ticketed and pigeon-holed on the shelves behind us. We have "industrial," "decorative," or "applied" art, as we now call it, and "fine" art. Fine art and "the arts not fine," as my friend Mr. Lewis Day has it. Thus, by degrees, the vast general public, who must get their ideas of art, like other things, ready made, have been taught to understand by the word "art" chiefly that form of portable, and often speculative, property—cabinet pictures in oil. Nor is this altogether wonderful, considering how, under our system of wholesale machine production, the appliances of common life have lost their individuality, interest, and meaning, together with their beauty. We are not sensible of any particular individual effort of thought or invention in an object which is only one of thousands turned out exactly like it. Plates, cups, and bowls, chairs, and tables; the molding and paneling of our wood-work, and the metal-work of our sacred hearth itself, are taken as matters of course, like other productions of commerce. They were not specially made for you and me; they must be made to suit Smith and Jones equally well, or equally ill; and we shall probably be charmed to see them in each other's houses. We know the furniture and fittings are only made to sell at a profit while the fashion lasts. Trade demands its "novelties" every season, and it would never pay to let a man sit contentedly in the chair that was solidly built for his grandfather. Much better let him fall between two stools in his uncertainty as to in which of the confidently named upholsterers' styles to seat himself.

Then, as to the application of art to the walls of his dwelling itself, is the average man in a much better case? You cannot expect him to put up costly and permanent decorations for the benefit of his landlord, either outside or inside. He is a wandering hermit-crab, only too glad to find an empty shell that will reasonably fit him, at a not too exorbitant rent—and as for decoration—well, at least there are paint and paper-hangings.

Economic conditions prevent our artisans from being artists. They have become practically, and speaking generally, slaves of machines. The designer is another being from the craftsman. It is only by a study of the conditions of the material in which the design is to be carried out, that we can get even workable designs; and even at the best, the designer who has no practical acquaintance with any of the handicrafts, necessarily loses that stimulus to invention, that suggestive adaptability which the actual manipulation of the material, and first-hand acquaintance with its own peculiar limitations and advantages, always gives.

One who develops a faculty for design has rarely a chance of being other than a designer. He has no time to make experiments—to strike out new paths; he must stick to the line by which he has become known, in order to get a living. Nothing narrows a man so much as working continually in the same groove. The utmost that can be said for specializing a single capacity is that you get an extraordinary mechanical or technical facility at the cost of all other qualities. It may not be possible to be supreme in more than one art, but the arts illustrate each other, and a knowledge of other arts, and their capacities and limitations, is sure to react upon an artist's practice in the one which most absorbs him. It is true we hear of artists here and there, who, though in the eye of the world inseparably associated with some particular form of, say, pictorial ability, nevertheless cultivate some secret amour in the form of a handicraft.

Among the secondary reasons for the decay of inventive and spontaneous design in the applied arts, I believe the hard and fast line which has been drawn between the artist and the craftsman is answerable, and the separation of the designer and the workman. The designer is, perhaps, kept chained to some enterprising firm. Novelties are demanded of him—something entirely new and original—every season, but not too much so. It is not surprising that the best talents should get jaded under such influences; that fancy should become forced or fantastic, and motive weak and tame, or perhaps lost altogether in a search after superficial naturalism, in defiance of fitness to material or use. Such a Nemesis is too apt to overtake the specialized designer, who designs on paper only, without the stimulus of close acquaintance with, and practice in, some handicraft. The mere change of occupation is refreshing and invigorating, and stimulate the inventions.

In so far as I have been successful as a designer, it has been, I believe, largely owing to my making myself acquainted with the conditions of the material in which a design was to be carried out; by striving to realize, in thought at least, the particular limitations and conditions under which it was intended to be worked; and I have always found that those very limitations, those very conditions, are sources of strength and suggestion to the invention. For I am old-fashioned enough to believe that every material has its own proper language—regarded as a medium for expression in design—and it is the business of the designer to find this out.

THE VALUE OF THE WORKS OF THE MONONGAHELA NAVIGATION COMPANY.

As COMPETITION becomes closer in the transportation interests every item of cost is closely examined to see if a saving cannot be effected. An examination of this kind has shown that the tax in the way of tolls on every bushel of coal moved through the locks of the Monongahela Navigation Company is about seven cents. The United States have made improvements both above and below, but this anomaly remains of an enforced payment on all commerce passing this intermediate section of the river.

The subject was reported upon in December last by a board consisting of Majors W. K. King, Amos Stickney, and A. Mackenzie, of the U. S. Engineers. They state that originally the river was not navigable except at certain stages. The improvements have been mostly by private parties, and have opened up an immense commerce. But the tax resulting has become a serious discrimination against the commerce as compared with other sections. The Navigation Company was incorporated in 1836 by the Pennsylvania Legislature, and there have been passed in all thirty-three acts affecting it. These provide, among other things, that the State may at the end of twenty-five years after the completion of the works purchase them at a sum equal to cost and improvements and keeping the same in repairs, with eight per cent. interest per annum thereon.

The works of the dam consist in all of seven locks with lifts of 8 feet to 14 feet. All were at first constructed 190 feet long and 50 feet wide; but additional locks have been placed at four dams which are 56 feet wide and 250 feet to 312 feet long.

The average shipment of coal for the past ten years has been 85,000,000 bushels per year, and the tolls collected for those years averaged \$225,000 per year. There are now 71 coal mines on the river, employing 15,000 men, and the money value of the commerce "far exceeds that of a majority of the streams upon which the United States Government has expended millions of dollars in improvements."

The stock of the company is stated to have sold before the agitation for the purchase of the works at a premium of 80 per cent., making, on a basis of 4½ per cent. interest, a total present worth of \$4,000,000. On the basis of sales of stock at various dates at \$100, \$89, \$82, the total share value would be about \$2,000,000 to \$2,200,000. The share capital between times had been increased to cover improvements made. The treasurer estimates that the works as they stand could not be duplicated for less than \$2,250,000 to \$2,500,000. But the board estimates that to make the works equal to new would cost \$300,000, and that the present intrinsic value cannot be more than \$1,950,000.

The only methods apparent to the board by which the general Government can obtain control are:

1st. By condemnation, with assessment of damages by a competent tribunal.

2d. By acceptance or purchase of the works from the State of Pennsylvania, after the State shall have extinguished the rights of the company.

Extensive appendices give the full information upon which the report is based.

We have received a circular letter, addressed to "The Water-Gas Fraternity," calling for the formation of a National Association of Water-Gas Engineers and Superintendents.

The call is signed by fourteen gentlemen connected with the water-gas industry in Chicago, South Boston, Binghamton, Lynn, and other places. It states that there are two hundred and fifty water-gas works now in successful operation in different sections of the country.

While we think that the formation of an association, as proposed, may result in much benefit to its members, we consider it a matter for regret that the water-gas and coal-gas engineers could not be united in one association, representing the gas industry of the country, rather than have several associations who, it will be inferred, are intended to promote the interests of a special system of manufacture rather than the interests of an industry.

INTENSE feeling is being aroused over the dumping of night-soil on the flats below the city of St. Paul, Minn. It is proposed now to move the dumping-place 10 miles from the city or burn all the refuse.

IS A TRAP ON THE MAIN DRAIN OF A BUILDING A NECESSITY?—FRESH-AIR INLETS, THEIR LOCATION AND TERMINATION.*

AN UNSAFE SUGGESTION.

WORKMEN of whatever craft have their particular method of executing any part of the work pertaining to their trade, and every competent workman has, or ought to have, some argument to offer in support of the plan of work followed by him; also, every such workman, eager to do the best work possible, and to have the best plans for doing it, invites discussion upon his system of plans, listens with interest to the argument for or against, and is ever ready to hear statements of new plans and willing to adopt them for his own, if convinced of their superiority over those formerly used. It is with a firm belief in the truthfulness of these opening statements that we attempt a brief discussion of the double subject selected by us, and submit another plan for accomplishing the same work, together with some arguments in support of the same.

To begin a discussion of the subject selected, we assert that for the welfare of the parties interested, a trap on the main drain of a building is necessary, and since the necessity of a trap argues the necessity of inlets, we will consider in this connection fresh-air inlets, their location and termination. That the trap and inlets must be used together needs no discussion, for to have a trap without a fresh-air inlet would be a greater blunder than to leave off the trap entirely, and if no trap is put on the main drain there can be no use for the fresh-air inlet.

In arguing for a trap on the main-drain we would state, first, that such a trap guards against any evils that may arise through mistake or oversight in the drainage or ventilation of plumbing-work, and we contend that no workman, be he journeyman or master plumber, can avoid making some mistakes during his experience that will serve as invitations to sewer-gas to enter houses. We do not believe in inviting sewer-gas into houses under any circumstances whatever, and advocate every means for keeping it out, or at least for limiting the amount; this the trap aids in doing.

Again, the variation in the heights of buildings makes the trap necessary. A party building or owning a house of two or three stories does not stop to consider his neighbor's interests, but discharges the ends of his soil-pipes in the most convenient place. In fact, it would be a difficult matter to support them in position at a height that would be necessary in some cases.

Another argument is, that with a trap the danger of contagious diseases, caused or aggravated by sewer-gas, is lessened. For, in a case where a trap is used, there is nothing to contend against except the foul air contained in the house-drain, which can be well controlled by the occupant of the building by the thorough flushing of the pipes. If, however, there is no trap, the occupant cannot, with all his precautions, have the same control over the sewer-gas.

While we argue for the trap and fresh-air inlets, we believe the present system of ventilation and the location of the inlets is not correct. This is only our judgment and may not be endorsed by others of our craft. We are pleased to state, however, that our judgment in this matter is not the result of fancy theories, but of actual experiments and practiced experience with what we believe to be a better system which we will now attempt to explain. In our locality the plumbing is, as a rule, so arranged that the laundry is placed either in the upper story, above the kitchen, or in the basement directly beneath it; consequently the same chimney is used for both kitchen and laundry flues, the flues being separated. Our plan is to have an extra or additional flue built in the chimney, between the kitchen and laundry flues, this to be constructed of cast-iron pipe and carried above the top of the chimney and capped with globe, Moore, or other good ventilator, also made of cast iron. We then carry what is now known as the fresh-air inlet, full size of house-drain, to this flue and connect it with the same; this done, we proceed with the plumbing as in the present style of ventilation. From our plan given here [referring to diagram accompanying the essay] it will be seen that this reverses the current; instead of having a tendency to flow out at any defect, or up through a fixture the trap of which has been syphoned, the tendency would be downward through the syphoned trap, and inward through any defects. There would be no change in the manner of back-airing or venting fixtures, but in extreme cold climates the upper ends of soil and waste pipes, in our judgment, should terminate in the space between the ceiling of the top story and the roof of the building, and constitute the fresh-air inlets. We expect opposition on this particular point, but, having had this system in use in dwelling-houses for nearly six years, we have practically demonstrated, to our own satisfaction that it is perfectly safe and a great success. The area of fresh-air inlets in no case to exceed the area of the vent-pipe in chimney.

* A paper prepared by Messrs. Richard Murphy and James A. Gibson and read before the National Association of Master Plumbers at the recent Annual Convention.

In presenting some of the advantages derived from this system of ventilation, we would state first, that the frequent unpleasant puffs of foul air through the fresh-air inlets at any discharge of fixtures, and unavoidable under the present system on account of the impossibility of locating these inlets at all times far enough away from the windows, are by the new system entirely avoided. In store-buildings it is very often necessary to locate the inlets in the sidewalk, or extend them through the curb, thus making it very unpleasant for the public; also, while thus exposed, they are apt to become clogged if any elbows or gratings are used. The system we advocate obviates these difficulties. Again, under the present system, there is a possibility of the trap on main drain being frozen, caused by the rush of cold air through the inlet; while by our plan this difficulty is obviated. This system also prevents vent-pipes, at their termination, from becoming useless in very cold weather by being filled with hoar frost, for at that particular time the pipe between the kitchen and laundry flues is hot, and there is not sufficient dampness in the atmosphere to create hoar-frost at inlets, which are the upper end of lines. In store or factory buildings a flue may be built in the stack from the boiler or heating apparatus. Another important feature is that water and air are always traveling in the same direction; at the discharge of fixtures the velocity of air-current is greatly increased, and the air following the water has a tendency to dry out the pipe very rapidly, thereby causing a better draught than in the present system. For, in the present

come filled with hoar-frost and thereby rendered useless, as there would not be sufficient dampness in the atmosphere. If from any cause the seal of the traps is broken, the danger from sewer-gas is greatly lessened, as the draught is downward at all times. The proper place for fresh-air inlets (which in this system should be the upper ends of soil and waste pipes) to terminate, especially in extreme cold climates, is, as previously stated, in the space between the top ceiling and the roof of building, and in this way prevent the traps from freezing, caused by cold air rushing down the different lines of pipe. If it is found that the air in the space between ceiling and roof is cold enough to cause the water in traps to freeze, there may be some arrangement made to heat this space.

Objections may be raised to the end of soil-pipe not being carried through the roof instead of terminating in the attic of building; but with the proper construction and placing of pipes as we have suggested in connection with the heated flues, we have fully demonstrated to our own satisfaction that the evil of pipes terminating above the roof by being filled with hoar-frost in extreme cold weather is entirely obviated. The foul puffs of air, so objectionable in the present system of placing them under windows, or upon sidewalks, are entirely removed. Objections may also be raised to the use of vent-caps, but as the kitchen flue is not always used, for ranges being substituted during the summer months, the majority of people would not go to the expense of heating the flues by other means. We think the use of vent-cap the next best method of creating a

FIGURE 1, AS PROPOSED BY AUTHORS OF THE PAPER.

system, the water and air are traveling in opposite directions, and after the main discharge of water has passed off, the air-current reverses and the water clinging to sides of the pipe is in a measure held in suspense, taking a greater length of time to dry out the pipe.

To show why this system of ventilation is better than others, we will illustrate by giving our opinion of how the different systems would work under the following conditions: Take a large building, say from seven to ten stories high, divided into flats; one or more of these flats are vacated, and the time of year winter and very cold. First, take the house-drain without the trap. The end of the soil and waste pipes above the roof would become filled with hoar-frost, and the house would be practically without ventilation or back-airing. The traps of the fixtures of the unoccupied flats would be syphoned, leaving a direct outlet for sewer-gas into the building. This might occur at any time, however, by evaporation or syphonage. Second, take the present system of ventilation with a trap on the main drain. The end of the soil and waste pipes would become filled with hoar-frost as in the preceding case, and the same action take place. The difference would be the direct opening would be there the same, but in one case the opening would be to the main sewer, and in the other to the foul air contained in the house-drain alone. Thirdly, take the system we advocate. The end of the soil and waste pipes would not be

draught, and also of preventing a downward draught, thus keeping the current constantly in one direction.

A word about the main sewers: We do not wish to be understood as opposed to their ventilation, but we think there ought to be other means provided to vent them properly. If necessary, build towers provided with furnaces, and air-inlets left at different points along the line of sewer to give a copious supply of fresh air; the expense to be met by the public, where it properly belongs. Under no consideration are we in favor of ventilating the main sewers through dwellings.

In conclusion, we leave with you a summary of our position on these questions. We believe that for the best interests of those concerned, a trap on the main drain of a building is an absolute necessity. The trap being useless without the fresh-air inlets, we also believe fresh-air inlets a necessity. We oppose the present system of ventilation and the location of the fresh-air inlets as necessitated by that system. We believe that we have, in this paper, advocated a better system, one by the use of which many of the difficulties of the present are overcome; one that is safer, and more conducive to health, and in the long run more economical than the other. And now, fellow-members of this association, we invite your earnest consideration of the points we have tried to make in presenting this paper, and hope that from it you may be able to select some hints, or gain practical help that may lead to

something better, that will serve to advance the interest of every member of the National Association of Master Plumbers of the United States of America.

[It is unfortunate that the gentlemen selected by the Cincinnati Association of Plumbers to consider the question of "Fresh-Air Inlets" on a house-drainage system should have built up a theory on an old notion which has often been shown in these columns to be untrustworthy—viz., that it would be safe to depend on an upward draft being constant in a kitchen chimney-stack, where the fire may often be suffered to go out or become too feeble to insure the desired object. Moreover, the author of the paper adds an extremely unsafe and dangerous item in terminating his soil-pipe below the roof in an attic space. Like other inventors of things more curious than useful, he sets up straw men to knock down, and suggests various bugbears as necessary consequences of the present accepted system. The intelligence of his audience in these matters and the publication of the fact that these experiments have been tried on one or two householders will doubtless prevent any extended adoption of them, and we are glad to notice that a committee at the convention realized the danger of the authors' suggestion.—ED.]

DRAINAGE-SYSTEM, CONANICUT PARK, HOTEL, R. I.,
JULY, 1887.
(See page 261.)

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

AUTOMATIC REGULATOR FOR STEAM OR HOT WATER.

THE accompanying illustration shows a novel steam or hot-water regulator for use either for dampers, draught-door, or air-inlets, lately invented by George E. Dixon, M. E., of Chicago, Ill., and called the Thermo-Pneumatic Regulator.

It consists of three principal parts—viz., the expansion-chamber A, the circulating chamber B, and the dia-

phragm cylinder C, with the lever F and other attachments as shown in the drawing.

The damper or draught-door to be automatically operated is attached to the lever F by the chain or cord in the usual manner.

In the diaphragm cylinder (C) *a a* represents the cylinder; *b* the piston, and *d d* the piston-guide. *e e* is a corrugated or bellows-shaped elastic tube, with flanged ends, made of rubber or other suitable materials so as to form a "bellows diaphragm."

The lower flange of this diaphragm is secured by the annular plate or gland *f f*, which in turn is held in position by the cylinder *a a*, forming a screwed joint at the base. The upper flange of the diaphragm is secured between the piston *b* and the piston flange *e*, forming a tight joint at the top of the cylinder. The diaphragm expands and contracts in accordance with the travel of the piston and allows of the piston being an easy fit in the cylinder so that it may travel without appreciable friction.

The metal rings *k k* are placed around the narrow portions of the corrugations to strengthen the diaphragm against excessive internal pressure. The valve *V* is a vent and regulating-valve, communicating with the expansion-chamber A through the bellows diaphragm. The expansion-chamber is enclosed in the circulating water chamber B, and it is attached to the base of the cylinder C by a screwed nipple as shown. The steam or hot water passes through the circulating chamber by the pipes *p p*, and are connected with the boiler or heater by pipes and stop-valves by which the circulation can be regulated or entirely shut off. The operation of the regulator is as follows:

The expansion-chamber A is allowed to fill with air through the regulating valve *V* which is then tightly closed and counter-balance weights put on, sufficient to bring the lever *F* down to the position shown by the dotted lines, thus throwing the dampers or door attached to the chain *n* wide open. The steam or hot water is then admitted to the circulating chamber B, and as this heating medium increases in temperature, the temperature of the air confined in the expansion-chamber A increases, producing a proportionate increase in volume, thus raising the piston *b* and the lever *F* and closing the damper or other device attached to the chain *n*.

The necessary increase in volume and consequent pressure required to raise the piston *b* is regulated by the addition or removal of counter-balance weights.

If too much pressure is produced in the expansion-chamber A it may be reduced by withdrawing a portion of the expansive medium by the regulating-valve *V*.

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas-Light Company.	Manhattan Gas-Light Company.	Metropolitan Gas-Light Company.	Mutual Gas-Light Company.	Municipal Gas-Light Company.	Krickerbocker Gas-Light Company.	Equitable Gas-Light Company.
July 30.....	25.90	21.31	21.02	29.13	25.72	21.78	31.06

E. G. LOVE, Ph.D., Gas Examiner.

ACCORDING to the report of the Chief Gas Examiner of London for the quarter ending June 30, the average illuminating power of the gas supplied by the Gas-Light and Coke Company was 16.59 candles; that of the Commercial Company, 16.75 candles, and that of the South Metropolitan Company, 16.43 candles. In no instance did the sulphur or ammonia exceed the limit.

THE *Gas and Water Review* expresses the opinion that the Clamond incandescent gas-burner, which is soon to be put upon the market, "will mark a distinct departure in gas-lighting." It refers to certain tests in which the yield was about 5.5 candles per foot of gas. Regarding the construction of the burner, it says: "The burner gives a very pure, white light; the 'cone' or envelope is made of magnesium, and covers the gas passage; when the gas is lighted the cone in a few seconds becomes perfectly incandescent. It can with ease be applied to the ordinary fittings. We have been given to understand that the cones will stand a considerable amount of usage. The Clamond lamp is also made in an inverted form, after the manner of the more generally known regenerative burners, and in this form it is admirably adapted for large buildings. The combustion is extremely perfect."

THE effect of the Electric-Lighting Act, which was passed by Parliament in 1882, is clearly shown in the following resolution, which, according to the *Electrician*, Mr. Hugh Watt intends to present in the House of Commons: "That the Electric-Lighting Amendment Bill in-

roduced by Lord Thurlow in the House of Lords having been deprived of its most important provision by the decision of the Committee of that House, and thus rendered useless for the purpose for which it was intended, no measure short of a repeal of the Electric-Lighting Act (1882), and the substitution thereof of legislation rendering it possible to supply electric-light to the public with a fair prospect of remunerative returns, will be of any benefit to the electric-lighting industry, and as that bill has to a very large extent destroyed the growth of the industry in this country and driven the export trade into American hands, it is desirable that the aforesaid act be forthwith repealed, and those engaged in this new industry (which now employs nearly £50,000,000 of capital, and over 50,000 workmen in America) be freed from the fetters of legislation, which have proved of so disastrous a character."

THE *Lancet* remarks that the observation of M. D'Arsonval that dynamic discharges and alternating currents do not (like static discharges) produce serious organic disruption of the lining tissues is not a new discovery. The special disruptive and fatal effect of the static discharge has long been known in this country, and was most fully brought out in Dr. Richardson's experiments on death by electric shock, conducted in the Royal Polytechnic Institution in 1869. In those researches sheep and other animals were killed by the static discharge, and the cause of death was shown to be due to the sudden expansion of gaseous parts of the blood and tissues, by which organic lesions of the most extensive kind were induced. In one of this series of experiments the skull of a dead animal was fractured by the static discharge, and arborescent markings of external veins, distortion of large veins, rupture of the heart, ecchymosis, rupture of the stomach, and decomposition of the blood itself, from the same kind of discharge, were phenomena traced to disruption from gaseous expansion. At the same time the static discharge does not always kill. It may simply stun, or cause a temporary anæsthesia, or produce a state resembling catalepsy, followed by recovery.—*Electrician*.

THE *Gas Engineer*, speaking of the recent improvements in Harcourt's pentane lamp, and the use of the "cut-off" for the flame, says: "Careful experiments show that no perceptible difference can be detected in the value of the light below the cut-off, although the difference in the total height of the flame would produce 12 per cent. difference in its value."

THE Board of Health of the city of Keokuk, Iowa, published its first report in March of this year, and we are glad to see that it begins by an attempt to take an account of stock, as it were—that is, to describe the actual situation of the city from a sanitary point of view. To begin with, there were 197 deaths. Dr. Shaffer says: "Place the population at 16,000, which many claim, and the death-rate is 12.31." Therefore, the population is probably not 16,000, but nearer 13,000.

Dr. Shaffer begins by commenting on certain points, which he declares to be a nuisance; and on the alleys, which he says "are the receptacle of all manner of filth and nastiness," which is in part accounted for by the fact that the manure from horse and cow stables is piled in them. He says: "The privies of this city are a counterpart of those found in the most obscure hamlets of the land. They, externally, are of nearly uniform architectural design, 4x4 feet at base and 5 to 6 feet high. They are located at the rear end of the lot and stand out prominently in the landscape. Internally they stink at all seasons. The vault, or hole in the ground, is a 'dug out,' not cemented; perchance a cask is fitted in the excavation. Very many are on the surface, and friendly rains are the means of washing away excrements into a no less friendly alley. In hundreds of cases the privy thus constructed is several feet higher than the house or the cistern. The cistern is not cemented."

After stating that the cost of the Board of Health for the year was \$158, he dryly closes his report with the remark that the Board of Health is not getting especially rich from the labor it is performing.

Keokuk is probably neither better nor worse than many comparatively new Western towns which have not yet got beyond the primitive village methods of disposing of refuse and excreta. There is a vast amount of cleaning up and sanitary work to be done in such places to make them fit for permanent habitation, and those which defer this work too long will receive a permanent check to their prosperity. Meantime we hope that the Board of Health of Keokuk will continue to hammer away at nuisances, and will soon be better paid.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

A SEWERAGE SYSTEM WANTED.

CLINTON, Mo., July 26, 1887.

SIR: I am induced to ask you the following questions: Is there any work extant on sewerage? Who has handled sewerage in a level country? We shall build sewers soon. We have water-works, gas-light, electric-lights, an artesian well 800 feet deep now flowing 260 gallons per minute, and street-cars in the near future. The city has a population between five and six thousand, is out of debt, but must have sewers now.

Your answer will greatly oblige your humble servant,
M. A. KITCHEN, Mayor.

[Vol. 7 of THE SANITARY ENGINEER AND CONSTRUCTION RECORD contains a large amount of matter relating to this subject; the price is \$3. Philbrick's "American Sanitary Engineering," price \$2, obtainable of the Book Department of THE SANITARY ENGINEER AND CONSTRUCTION RECORD, would be a useful book for the mayor or public officials of any town contemplating the introduction of a system of sewers, as it gives a general idea of the character of the problems involved. It will indicate the importance of employing an engineer of experience in this special department of engineering by any city contemplating the introduction of sewers, the names of a number of whom will be found in the professional column of the advertising pages of this journal.]

It is a great mistake to suppose, however, that the reading of any book or books will enable one not possessing special training and experience in these matters to economically and efficiently sewer a town. Your city can well afford, and will find it cheapest in the end, to pay a competent man to advise you in these matters. "The Separate System of Sewerage, Its Theory and Construction," by Prof. Cady Staley and George S. Pierson, price \$2.50, is also a useful book to those constructing small pipe sewers, though the construction described is mainly that adopted in the city of Schenectady, in New York State.

To dispose of the sewage of a level district is more expensive than where topographical conditions are more favorable. An experienced engineer, however, will be able to select the method most economical, with due regard to efficiency under the circumstances.]

RULES FOR FIGURING STEAM-HEATING SURFACE.

HONESDALE, PA., July 18, 1887.

SIR: Since using Baldwin's "Steam-Heating for Buildings" for computing heating surfaces, I have had several encounters with steam-heating men, and in every case I have found by his rules less steam-heating surfaces than they claim to use. Will you kindly figure the following for me by his rules and see if I am correct?

I want to warm a well-built brick house situated on the north-east corner of — street. It has hard-finished walls, papered. The sitting-room is 16x20x10 feet, has 160 square feet of wall exposed to west wind, 200 square feet of wall exposed to north wind, 63 square feet of glass surface; desired temperature 70°, 10° below being about our lowest outside.

I figured that 57 square feet of direct heating-surface was necessary and would answer. Am I right? This is taking it for granted that the house is properly warmed in other rooms and hall. The room mentioned is on the first floor, two feet above the level of the sidewalk, and is unusually tight, so far as joiner-work is concerned.

Yours truly,

W.

[To figure for a room 16x20x10 feet high—hard-finished walls—Baldwin's rules (pages 26 and 27, eighth edition), we have 16' x 10' = 160 □ west wall,
20' x 10' = 200 □ north wall,

360 □ total for both outside walls, less the window area—which you give at 63 square feet = 297 square feet of cold walls.

He considers the cooling value of a square foot of a hard-plastered wall (one without furring and lathing) to be one-fifth the value of a square foot of glass, which places the total value of the wall in cooling powers as equal to 59½ square feet of glass. To this, according to his rule, we must add the glass and treat all as glass. Thus we have 59½ + 63 square feet of glass = 122½ square feet of glass, or the equivalent thereof if it were all glass.

Then, to find the amount of average pipe surface that will warm as much air as a square foot of glass will cool, he says: "Divide the difference in temperature between

that at which the room is to be kept and the coldest outside atmosphere by the difference between the temperature of the steam-pipes and the air of the room," and the product will be the square foot of pipe surface that will offset the cooling of a square foot of glass.

According to this, then, we have room 70° Fah., outside temperature 10° Fah. (below) = (difference) 80° Fah. Again, temperature of steam-pipe 212° Fah. less temperature of air of room = 142° Fah. Then $\frac{80}{142} = .563$ as the plate or pipe surface, in square feet, that will offset a square foot of glass.

According to this, then, we have $122.4 \times .563 = 68.91$ square feet of pipe or radiator surface to offset the cooling done by the walls and windows. To this must be added the amount of radiator surface necessary to warm the air admitted to the room in an hour. For instance, your room has a cubic contents of 3,200 cubic feet, and say it changes twice in an hour and is warmed from 10° below to 70° above.

Then we have $\frac{3200 \times 2 \times 80}{50} = 10,240$ heat-units; in which the (50) is the approximate number of cubic feet of air that a heat-unit will warm one degree Fah. This, say, is the equivalent of 10 pounds weight of steam and requires about 30 square feet additional of radiator surface to condense it. Thus we have $68.9 + 30 = 98.9$ as the total quantity of pipe in square feet for 10° below zero.

If your room is a tight box, or nearly so, 70 to 75 square feet will do, but should air be admitted accidentally or otherwise it must be provided for on the above basis.

Although the mercury may reach 10° below at an odd time in your neighborhood, we think 10° degrees above as amply low to figure on as a basis of calculation. This will lessen the surface by $\frac{1}{4}$, or to about 75 square feet for your room. With 98.9 square feet of radiator in such a room it is 1 square foot to about 33 cubic, and with a radiator of 75 square feet it is about as 1 to 43, and, as the steam man usually figures it, either of them appears pretty ample.]

DANGER OF FIRE IN SUMMER HOTELS.

NEW YORK, July 21, 1887.

SIR: A great deal has been written about the sanitary condition of our summer resorts, but have you ever thought of chances of fire in such hotels as at Long Branch? It makes me shudder to look at them and think of it. It seems to me that each and all of them should have fire-proof stairs inclosed by brick walls. They might be towers and ornamental features of the buildings. This is something for Dr. Hunt, of New Jersey, to think of.

Respectfully, ARCHITECT.

CERTIFICATES TO PLUMBERS' APPRENTICES.

GERMANTOWN, PA., July 20, 1887.

SIR: Would you let me know how to word an apprentice certificate? I having served four years with a master plumber of Germantown. Having seen in your paper that in other cities plumbers give certificate, my boss is willing to give me one if I would get the wording of them—just the part that is to be printed. If you could send them to me you would oblige,
GERMANTOWN.

[Referred to our readers.]

ERRATUM.

In the "Thermus" article on "Hot-Water Heating and Fitting" in our issue of July 20, page 212, the cuts Figs. 18 and 19 should have been turned so the arrows would appear to move in an upward direction. Through a misunderstanding, also, the numbers were placed at the wrong end of the cuts.—ED.

RECKLESSNESS OF BRIDGE-BUILDERS.

PEOPLE who have been watching the erection of the false-work at the east shore anchorage pier at the bridge and out in the river between piers 2 and 3 have been wonderfully interested in the agility and what seemed to them dare-devil recklessness of the trained men on the job. They have seen them crawling along the girders and braces nearly a hundred feet high, leaping from timber to timber, or running along the narrow planking, now stooping over to aid in the hoisting of timber or iron, now standing on the extreme edge of the river front of work peering down upon the rocks and river below, or going along hand over hand among the braces with apparently as much ease and comfort as though moving along on terra firma.

"They are all used to that kind of work," said General Field, of the Union Bridge Company, "and have no fear whatever. When we were building the cantilever over the whirlpool rapids of Niagara, 240 feet above the rushing waters, they were just as daring as they are here. I remember when we had the job about completed I was up there one day. The cantilever arms were within fifty feet of each other, and it was decided to connect them tempor-

rarily with a plank. This plank was fifty-five feet in length, about two and a half feet of each end resting on the cantilever arms. The foreman had issued a strict order prohibiting any of the men from crossing the plank until it was firmly fastened at each end, the penalty being immediate dismissal. There had been a great deal of talk among the men as to who would be the first one to cross. I was standing on the American side looking at the structure when I saw one of the men walk out on the plank, look at it a minute, then looked down into the whirlpool below. I felt that he was going to cross the plank, but I was too far from him to make him hear. He waited a second or two, and then deliberately walked out on the plank, and when he reached the middle of it he stooped over, seizing the edges of the plank with both hands and, throwing his feet up, he stood on his head and kicked his heels and shouted to the terrified lookers-on. He must have been a minute doing it, but I felt as though it was half an hour. After satisfying himself that he had kicked enough he regained his equilibrium and then trotted along the plank to the opposite side, from where he started, seized hold of one of the iron braces of the cantilever and went down it head first, hand over hand, to the bottom. I never saw anything like it before. Of course the foreman discharged him and he was laid off two or three days, when I sent for him. He was one of the best men on the job, and I talked to him like a Dutch uncle and put him to work again. These men have no fear; they are brought up to the business and feel just as safe 150 feet in the air as they do on the ground. Of course, I can see how the people wonder at such things, but we have got used to it. The best time to see them travel is at the dinner hour, or when the day's work is completed."—Poughkeepsie Eagle.

COMMISSIONER OF PUBLIC WORKS JOHN NEWTON, of New York City, has invited Rudolph Hering, C. E., of Chicago, to make an examination, in conjunction with Colonel Julius W. Adams, of the entire sewerage system of the city with a view to its improvement and enlargement. The preliminary work will be finished in a few days.

ARCH STONES, NEW CROTON AQUEDUCT.

AT shaft 23 the voussoirs, or arch stones connecting brick arches of tunnel with the shaft, were set on Tuesday, August 2; and brick masonry of shaft has been carried up to necessary height for receiving the iron castings, which will have special dimensions, as the tunnel at this point will be under pressure. This is the first work of the kind completed on the aqueduct.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

THE annual meeting of the society, will be held in Philadelphia, Pa., in the latter part of the month of November, 1887. The exact date and details will be the subject of a later announcement. Applications for membership to take effect at this meeting should be in the Secretary's hands by October 1. To admit also of earlier distribution of the printed papers in advance of the meeting, and more time for the preparation of discussions upon them, the manuscripts of papers for this meeting should be forwarded to the Publication Committee before September 24. The Secretary would also like to have authors forward at once to him the titles of papers for the meeting, in advance of the preparation of their text.

WE have received a large, neatly-framed photograph showing the stand-pipe of the Massillon, O., Water-Works, of which S. R. Bullock & Co., of New York, are the owners. The stand-pipe was built by Messrs. Tippet & Wood, of Phillipsburg, N. J., and is 25 feet in diameter and 150 feet high.

PERSONAL.

MERTILLOW R. CLAPP, President of the Clapp & Jones Manufacturing Company of Hudson, N. Y., died July 27 of Bright's disease, aged 60 years. Mr. Clapp was the inventor of the steam fire-engine bearing the name of his company.

ENSIGNS G. W. STREET and J. W. McKay, of the U. S. Navy, have been selected by the Secretary of the Navy to take a course of study in France to fit them to become constructors in the recreation of the navy.

GEORGE L. RIVES has been appointed by Mayor Hewitt a member of the Rapid Transit Commission in place of Peter B. Olney, resigned.

THOMAS T. WIEMAN, Jr., Chief Engineer of the Pennsylvania Canal Company, died at his home in Harrisburg, Pa., August 2, aged 73 years. He had been connected with railroads and canals in Pennsylvania for many years.

L. F. BILLINGER, C. E., has been appointed to a chair of engineering and architecture in Norwich University, Vt.

MR. G. H. RANDALL has been appointed City Engineer of Fond du Lac, Wis., succeeding Mr. N. Boardman, resigned.

MR. JOHN G. LOW, of Chelsea, Mass., has devised a battery and incandescent electric lamps for carriage-lighting.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

Preliminary sketches by W. J. W. Howe, Jr., will be sent to the three architects whose plans for the Birmingham, Ala., Court-House were the best in the previous competition, and they will be asked to submit new plans.

MILWAUKEE, WIS.—H. C. Koch & Co., Ed. V. Koch & Co., George B. Ferry and H. B. Schnetzky, Milwaukee architects, have presented plans for the Ninth Ward school, also for two school-buildings in the Fifteenth ward.

In the competition for designs of the Seventh Ward school-building at Syracuse, N. Y., C. E. Colton's design was selected. The cost will be about \$29,800. The other competitors were Baxter & Hull and A. L. Merrick.

KANSAS CITY CHURCH COMPETITION.—Competition has been instituted somewhat on the lines of the Kansas City Building Exchange Building Competition for plans for the new Grace Episcopal Church. Messrs. C. W. Edlitz and McKim, Mead & White, of New York; Burling & Whitehouse, of Chicago, and Adriance Van Brunt, of Kansas City, have been invited to prepare preliminary designs, for which they are to be paid \$200 each. No professional adviser, however, is provided for as in the case of the recent Kansas City competition. Other architects are invited to compete. Full particulars may be obtained by addressing F. E. Tyler, Secretary, 622 West Seventh Street, Kansas City, Mo.

PROPOSALS.

ELECTRIC ALARMS.—The Common Council of the city of Trenton, N. J., will receive at their meeting, in the City Hall, August 16, proposals for furnishing eighteen new electrical police patrol boxes, and a central office plant for a police patrol system, and for furnishing necessary wires and apparatus therefor, and for putting the same in working order, according to the specifications now on file in the office of the city clerk.

Also, separate proposals for furnishing a one-horse police patrol wagon, with equipments complete. Jno. C. Owens, City Clerk.

IRON WORK for Morse Peake Light Station, Maine. Until August 15. Address, Major W. S. Stanton, U. S. Engineer, Post Office Building, Boston.

STONE RIP-RAP for Back River Light Station, Chesapeake Bay, Virginia. Until August 13. Address, Capt. J. C. Mallory, U. S. Engineer, Light House District, Baltimore, Md.

LEEVE WORK.—Proposals for the construction of 660,000 cubic yards of levee work at Kempe and Deer Park, La., are asked for by Capt. Dan C. Kingman, U. S. A., No. 3 So. Rampart Street, until September 1.

DREDGING.—Major A. N. Damrell, U. S. A., Mobile, Ala., asks proposals for dredging in Biloxi Harbor until August 17.

ARMY buildings, twelve in number, at San Antonio, Tex. Until August 23. Address A. J. McGonigle, Quartermaster, U. S. A., San Antonio, Tex.

STEAM-HEATING AND WATER-SUPPLY.—Proposals will be received at the office of the Board of Trustees in Jamestown, D. T., until August 27, for putting in steam-heating and water-supply for the North Dakota Hospital for the Insane. Drawings and specifications can be seen at the office of the Board of Trustees, Jamestown, D. T., and office of Willett & Pashley, architects, 207 Dearborn Street, Chicago, Ill., on and after July 27. F. E. Jones Secretary.

STREET WORK.—Proposals will be received at the office of the Board of Public Affairs, of Cincinnati, until August 25, for the improvement of Charles Street, from Colerain Avenue to the east line of Fifth Avenue, by grading, setting curbs, and crossings, flagging gutters, bow doring the roadway and constructing the necessary culverts, drains, and retaining walls, according to specifications on file in the office of the Board of Public Affairs. Thos. G. Smith, President.

BRIDGE.—Proposals will be received at the office of the county clerk at Cherry County, in Valentine, Neb., until August 18, for the construction of a bridge across the Niobrara River, about three miles north of Valentine. The bridge to be either one span of 96 feet or two spans of 48 feet each, floor of bridge to be 9 feet above low water mark, roadway to be 16 feet wide, no native timber to be used in the construction of the bridge except for cribs around piers and floor-plank; floor-plank to be three inches thick, and not less than 8 inches wide. Bidders to furnish plans and specifications. Geo. L. Fisher, County Clerk, Valentine, Neb.

HEATING AND WATER-SUPPLY.—Proposals for the heating and ventilation, new cell block, boiler stack, conduit and water-supply for the State House of Correction and Branch of State Prison in the Upper Peninsula, at Marquette, Mich., are invited by the Board of Commissioners of said House of Correction and Prison until August 24. Plans, specifications and instructions to bidders may be seen on and after July 23, 1887, at the office of the Commissioners, Marquette, and at the office of the architects, Scott & Co., 4 and 5 Wayne County Savings Bank buildings, Detroit, Mich. Proposals must be submitted separately for the heating and ventilation, cell block, conduit, boiler stack, and water-supply, and the Board of Commissioners reserve the right to reject any and all bids. For further information apply to the Secretary of the Board at Marquette, Mich. F. P. Royce, President of Board of Commissioners for the State House of Correction and Prison, Upper Peninsula.

BRIDGE on Agassiz Road, Back Bay, Boston, Mass. Until August 12. Address, The Park Commissioners, 87 Milk street, Boston, Mass.

WROUGHT IRON BRIDGES.—One bridge, 100 feet span, centre to centre of end piers; roadway, 12 feet in the clear; headway, 14 feet from floor to bottom of portal bracing; to be carried on two iron bents or stools 20 feet high; bents to rest on granite blocks 12 inches thick, and of sufficient size to support structure when loaded without settlement. One bridge, 150 feet span; roadway, 14 feet; headway, 14 feet; to be carried by two iron bents, same as

above, except that they shall be 25 feet high; or two spans of 80 feet each; roadway 12 feet in the clear; headway, 14 feet in the clear; to be carried by two iron bents, same as above, in place of stone abutment, and in centre to rest on two iron cylinders, properly braced, and filled in with concrete, one half cement. Until September 1. Address, W. G. Gammon, Chairman of Commissioners of Roads and Revenue, Floyd County, at Rome, Geo.

REPAIRING ARMORY.—Proposals for work to be done in repairing the Syracuse State Armory will be received by mail or in person up to August 16, at the State arsenal, Thirty-fifth Street and Seventh Avenue, New York City, at which time bids will be opened and declared. J. M. Variar, Chief of Ordnance.

GAS LAMPS.—Sealed proposals will be received August 11, at 12 M., for setting gas-lamps, posts, etc., on Evergreen Avenue, from Ralph Avenue to Grove Street, Brooklyn. Plans and specifications may be seen, and forms of proposals can be procured, on application at the Department of City Works. George Ricard Connor, Commissioner of the Department of City Works.

MONITOR.—Completion of the double-turreted monitor Miantonomah at the Navy Yard, New York. Until September 10th. Address William C. Whitney, Secretary of the Navy, Washington, D. C.

BRIDGE.—Proposals will be received until August 15, for building the superstructure of the proposed bridge across the Mississippi River at Franklin Avenue, Minneapolis. Andrew Rinker, City Engineer.

LEEVE WORK.—764,000 cubic yards of new work and 554,000 cubic yards of enlargement. Until September 12. Address the Board of Mississippi Levee Commissioners, S. W. Ferguson, Secretary, at Greenville, Miss.

LIGHTHOUSE TOWER.—Proposals will be received, until August 15, for furnishing complete the iron-work for tower-stairs at Moose Peak Light Station, Me., and stair railing for watch-room at Sankaty Head Light Station, Mass., in accordance with plans and specifications that may be seen upon application at this office. W. S. Stanton, Major of Engineers, U. S. A., Engineer 1st and 2d L. H. Dist., Room 142 Post Office Building, Boston.

BUILDING.—Proposals will be received by the Commissioners for the erection of a new court-house for Suffolk County, Mass., until August 12, for the erection of the northerly section of the new building from the second floor level. Plans and specifications can be obtained at the office of the architect, Pemberton Square. The right to reject all bids is reserved. S. B. Stebbins, Thomas J. Whidden, Godfrey Morse, Commissioners, Boston.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 258-259-260.

WATER. SEWERAGE, ETC.

MORRISVILLE, VT.—The town is trying to enter into an agreement with Warner & Sumnerville, of Waterbury, who own the Morrisville Water-Works, to supply water to ten hydrants.

FORT WAYNE, IND.—Plans and specifications have been prepared for obtaining a supply of water from artesian wells to lessen the water-famine now prevailing.

IMLAY CITY, MICH., is agitating for water-works.

WALNUT GROVE, ARIZ.—A company is building a dam across the Hassayampa River, at a cost of \$330,000, to store water for irrigation.

SANTA CRUZ, CAL.—An agitation for sewers has been begun.

DUNLAP, IOWA.—The town votes on the question of providing a water-supply at a cost of \$10,000.

PLATTSMOUTH, NEB.—A recent special city election to decide upon the raising of \$30,000 for the construction of sewers went very strongly in favor of the project.

COLUMBUS, KAN.—Messrs. Long & Doubleday are enlarging considerably their first plans for the water-works. Instead of putting up the 80-foot tower, they are putting up a stand-pipe which will tower heavenward 150 feet. They are constructing a reservoir 60 feet in diameter, in order to have an extra supply of water at their command in case of fire. They are putting in two pumps instead of one under the first plan, one of which will have a million-gallon capacity per day. They are putting in two big boilers instead of one. Besides these, other additions are being made to add to the efficiency of the works, which increase the cost of the machinery to the company, with no additional cost to the city or water consumer.

ORANGE, N. J., will use the Hyatt filter for its water supply; cost, about \$8,000.

SANFORD, FLA.—It is proposed to hold a town meeting to discuss the advisability of bonding the town for sewers and other improvements.

BRODHEAD, WIS.—Brodhead has granted an exclusive franchise to the Brodhead Hydraulic Company to use the streets for water-works for twenty-five years.

UNION GROVE, WIS., will have a water-supply from artesian wells.

TORONTO, ONT.—Superintendent Hamilton, of the water-works, has proposed an outline of two schemes for increased water-supply. One is to put a conduit pipe across the bay into the lake, erect new pumping engines, and build a reservoir; estimated cost, \$300,000. The other plan is to establish a new pumping station on the lake shore, with a new reservoir; the pumping engines to have a capacity of 16,000,000 gallons daily.

OROVILLE, CAL.—The Butte and Yuba Orange Irrigation Canal Company, organized at Oroville with \$1,000,000 capital, proposes to tap the main Feather River at the junction with the North Fork and take 100,000 inches of water through Yuba and Butte counties.

ST. CLOUD, MINN.—The City Council rejected all the bids recently submitted to construct water-works.

LINCOLN, ILL., needs a better water-supply.

TUSCUMBIA, ALA., wants water.

TUNICA, MISS., will have water from an artesian well.

TRENTON, N. J.—The City Engineer will make surveys and report on the outlet sewer.

KENT, O.—Judge Gilmer, of the Common Pleas Court, has granted an injunction restraining the Kent Water Company from using the water of Plum Creek. The suit was brought by manufacturers on Cuyahoga River, who feared injury to their water-power. It is said also that the Board of Health feared pollution of the stream by slaughter-houses, and were opposed to using the water of the creek.

WATER-WORKS will be constructed at Lewiston, Ill.; Washburn, Wis.; Hillsborough, N. H.; Olneyville, Ill.; Greensboro, N. C.; Yorkville, Ill.; Milledgeville, Ill.; Petersburg, Ill.

MILWAUKEE, WIS.—The \$60,000 that has been appropriated for the completion of the Memnonie intercepting sewer, on the south side, is deemed sufficient to finish it, and work will be pushed on it at once.

RACINE, WIS.—The Racine Water Company has increased the number of directors from three to six.

MOTT, SISKIYOU CO., CAL., is establishing water-works.

GREEN ISLAND, N. Y.—The contract for the construction of the sewers has been let to McGowan & Van Vranken for \$14,450.50, and the Sewer Commissioners have asked the village trustees to have bonds issued to the amount of \$50,000. The sewer-commissioners, August 2, decided that the issuing of bonds for \$17,500 for the new sewers would be sufficient.

WILLIMANTIC, CONN.—The report of the Sub-Committee on Sewerage contains an estimate of the cost of building them by Samuel M. Gray, of Providence, R. I. The estimate is \$177,155.

OCALA, FLA.—The City Council has contracted with W. A. Jeter to construct water-works and erect fifty hydrants. The work will cost \$70,000.

OAKLAND, FLA., will obtain water from an artesian well.

ALBION, N. Y.—Incorporated July 30 was the Albion Water-Works Company; capital, \$40,000. Charles R. Bassett, of Brooklyn, is one of the incorporators.

SANTA ROSA, CAL.—There is talk here of organizing a new water company.

NEWPORT, R. I.—The City Council has voted to submit to the people at the September election a proposition to appropriate \$8,000 for a soldiers' and sailors' monument, and laid on the table a proposition to submit to the people a proposition to appropriate \$33,000 for sewerage and paving of the principal business streets.

LOS ANGELES, CAL.—Rudolph Hering, C. E., of Chicago, has been engaged by the city to prepare plans for a sewerage system. City Surveyor Eaton has prepared an outline of what is needed, indicating a cost of \$2,000,000.

ALTOONA, PA.—City Council has voted an appropriation of \$29,000 to finish Kittanning reservoir, and \$4,000 for water-mains.

ALBANY, N. Y.—The Board of Contract has ordered specifications prepared for the Martinsville sewer, and work will soon be undertaken.

MEMPHIS, TENN., has entered into a contract with the Artesian Water Company for a supply of water from artesian wells, the city to pay for the first 100 hydrants \$80 each per annum; for second 100, \$70 each; for the third 100, \$60 each; and for all hydrants above 300, \$50 each per annum. The company is to erect and supply water to flush-tanks, the city paying \$15 per annum for each tank. The city will also pay for water for other purposes than hydrant supply and flushing \$3,000 per annum.

CHARLESTON, S. C.—The Charleston Water Company has bought land, and will construct reservoirs in the north-eastern part of the city. The supply will be from wells.

GRAND RAPIDS, MICH.—The committee on Water-Supply has reported, recommending that Mr. J. D. Cook, C. E., of Toledo, O., be appointed to prepare plans and direct the construction of the work, taking water from Grand River above the Soldiers' Home. It is proposed to obtain 10,000,000 gallons daily at a cost of \$1,000,000.

PEABODY, MASS.—The Water Board has notified the Salem board that all arrangements relating to a supply of water to the latter are annulled.

YUMA, ARIZ.—Articles of incorporation of the "South Gila Canal Company of Yuma County," have been filed in the office of the Recorder, capitalized at \$1,000,000. The articles of incorporation of the "South Gila Development Company" were filed at the same time, capital stock \$2,000,000. The incorporators of both companies are, Robert McPherson, W. E. Pope, and O. F. Thornton.

NORFOLK, VA.—G. W. Baker, of the Orange, N. J., Water Company, is preparing to submit an offer for the purchase of the city water works.

EAST LIVERPOOL, O., will have a popular election to decide on the question of raising \$30,000 for extensions of the water-supply.

CANTON, N. Y.—At a special election July 26, on the question of raising \$35,000 for sewers, the project was voted down by a large adverse majority.

COLORADO SPRINGS, COL.—Our correspondent writes: "Lowrie & Aulls, of Denver, Colorado, have been asked to prepare plans for a sewerage system."

SACRAMENTO, CAL.—An investigation of the water from the artesian wells has been made by Dr. W. F. Briggs, of the Improvement Association.

OAK CLIFF, TEX.—Our correspondent writes: "Company chartered under the name of the 'Oak Cliff Water-Supply Company,' capital authorized, \$50,000; subscribed capital, \$30,000. Have bought pumps and boilers and pipe and now putting up stand-pipe."

WATER-WORKS will be built in the following towns: Atlanta, Ill.; Lewiston, Kan.; Custer, O. (wells); Hebron, Neb.; Melrose, Minn.; Gladwin, Mich.; Belair, Md., cost \$2,000; Clinton, Mich.; Wellston, O.; Canton Falls, Minn.; Clinton, Ill.; Hillsboro, Ill.

SKANEATELES, N. Y.—Incorporated August 2 was the Skaneateles Water-Works Company, capital, \$40,000.

KALAMAZOO, MICH.—The committee on fire and water recommends the sinking of a new well for additional water-supply.

GOLDTHWAITE, TEX.—An artesian well will be sunk for a water-supply. Address J. M. Forehand.

FLORENCE, ALA.—The Cypress Water-Works Company has been organized.

OGDENSBURG, N. Y.—The city is considering the advisability of introducing a plant to filter the water, which is taken from the Oswegatchie River. Address the Superintendent of Water-Works.

CANTON, MASS.—The selectmen have called a special town meeting for next Wednesday evening, August 10, for the purpose of electing three persons to constitute a board of water-commissioners, also to see if the town will issue bonds.

DOWNS, KAN.—Our correspondent writes: "Our city has voted \$30,000 for water-works. No contracts have been let for the system that has been adopted—viz., stand-pipe. We desire first to negotiate the bonds."

ST. CLOUD, MINN.—C. E. Gray, of Fergus Falls, Minn.; Sykes & Phelps, Minneapolis, and H. P. Upham, of New Hampshire, are bidders for the water-works construction.

ST. PAUL.—Preparations for the laying of the water-main to connect the West Side with the general service have been begun by the firm of McRitchie & Nichol, of Chicago. The contract price is \$12,000, which calls for a 16-inch cast-iron pipe, to be laid from the foot of Broadway to the foot of State Street. A ditch or canal averaging four feet in depth will be dug in the river bed with a dredging boat.

LARAMIE CITY, WYO.—Our correspondent writes: "Messrs. Lowrie & Aulls, Civil Engineers, of Denver, Col., have just prepared plans for a \$75,000 sewerage system for this place."

CHICAGO.—In about three weeks, it is expected, proposals for the new pumping-engines and water-works tunnel will be advertised for.

WATER COMPANIES.—Incorporated are the Spring City, Pa., Water Company and the Rogers Ford, Pa., Water Company. Address D. S. Newhall, for both.

MONTGOMERY, ALA.—George A. Ellis, of Durham N. C., has been engaged by the city to construct a system of sewers.

WASHBURN, WIS., has awarded a contract for water-works to John Dickinson, of Chicago. The Holly system will be used.

LOUISVILLE, KY.—The Falls City Varnish Co. are building water-works; cost, \$10,000.

CANTON, DAK.—The Canton Improvement Company asks the city council for exclusive water-works franchise.

HUDSON, WIS.—The contract for building the engine-house for the water-works has been let to F. Fay, of New Richmond, and that for laying the pipes to Johnson & Son, Stillwater.

BARNETT, GEO.—The Bloomfield Water-Power Company has been incorporated. Capital stock, \$150,000.

DEERY, PA.—Water-works will be built. Address J. K. Russell.

PAWNEE CITY, NEB.—Address C. E. Casey in regard to water-works.

WESTFIELD, PA.—Messrs. Heermans & Lawrence, of Corning, N. Y., will build water-works at this place.

ATLANTA, ILL.—Water-works will be built by L. M. Hoblitt.

LOUP CITY, NEB.—Our correspondent writes: "Bids for water-works will be opened by A. A. Richardson, C. E., of Lincoln, Neb., at this place, at 12 o'clock noon, August 18 next."

DENVER, COL.—Our correspondent writes: "\$100,000 is to be spent in enlarging our sewerage system."

DENVER, COL.—The Health Board has sent a written request to the City Council to cause the construction of sewers.

ANDERSON, CAL.—A corporation has been formed at Anderson, to be known as the Anderson Improvement Company, with a capital of \$10,000. It has for its object the erection of warehouses, water-works and other improvements.

WEST LIBERTY, IOWA, will obtain a supply of water from artesian wells.

READING, PA.—The recent heavy rains demonstrated the need for sewers. Councils Committee on Sewers has therefore decided to recommend a special tax of two mills to raise \$50,000 for the purpose. It is proposed to construct five courses at an expense ranging from \$1,500 to \$30,000.

FLUSHING, L. I.—The contract for extending water-mains to the Government Post at Willet's Point has been let to Thomas Touhey, at \$7,475.

FORT WAYNE, IND.—The water-works trustees are considering methods of increasing the water-supply. Messrs Flemming and Bass, owners of most of the water privileges here, offered to sell the feeder and the feeder dam and all land necessary to the exclusive use of the water right for \$50,000, or would accept a rental of \$5,000 a year, or would supply and pump water, with water-power, at the same rate per million gallons the city paid at the time of the most economical workings of the system, if the city would provide two turbines and other appliances at a cost of about \$10,000, which was about half the cost of the proposed new engine.

TOPEKA, KAN.—Bids for construction of sewers in District No. 11 have been rejected, and new bids are advertised for.

OWENSBORO, KY.—Address the Owensboro Water Company in regard to improvements to be made in the works.

VISALIA, CAL., will spend \$12,000 for sewerage work.

FRESNO, CAL., needs sewers.

FORT FAIRFIELD, ME.—Fort Fairfield has accepted a charter of organization, and has voted to pay \$600 per annum for twenty years to any company that will put in water-works, and to exempt said company from taxation for ten years.

OTTAWA, KAN.—A strong effort is being made here to induce City Council to have plans prepared for a system of sewers.

GAS, STEAM, BUILDINGS, ETC.

HASTINGS, MINN.—A number of business men have met to consider the question of drilling a well for natural-gas. The matter has been referred to a committee, consisting of J. C. Meloy, J. D. Collinson, and M. V. Seymour, to investigate.

NAPA, CAL.—The city has granted a franchise to a company to light the streets with electric-lights.

MARQUETTE, MICH.—The streets will be lighted with electric-lamps.

MEMPHIS, TENN.—Legislative Council has made an agreement with the Equitable Gas Company, by which the latter acquires the right to lay mains, build works, and furnish gas at a price not exceeding \$2 per 1,000 cubic feet; twenty-five cents off for prompt payment.

CANASTOTA, N. Y.—The question of lighting the streets with electricity is being agitated.

NORTH LA CROSSE, WIS.—A gas company is being organized here.

PARIS, N. Y.—A movement is on foot to secure the lighting of the streets.

MARCY, N. Y.—G. M. Keplar, of the East Pennsylvania Oil and Gas Company, is making arrangements for the sinking of wells in this vicinity.

HARRISBURG, PA.—A company has been formed to bore for natural-gas near the city.

HYDE PARK, ILL.—The newly organized Hyde Park Electric-Light Company is preparing to erect plant to cost \$100,000.

CHATTANOOGA, TENN.—Natural-gas has been struck at the Logan well, located six miles from this city. A stock company has been formed, with a paid-up capital of \$20,000 to put down five more wells. If gas exists in paying quantities in this locality, Chattanooga is going to have it.

SYRACUSE, N. Y.—The Syracuse Gas-Light Company will make improvements, costing \$80,000.

DENVER, COL.—The Underground Electric Conduit and Water-Pipe Company has contracted with the Denver Electric Light, Heat and Power Company for two miles of mains which will run from the works to Seventeenth Street and then to Broadway. Laterals will be run wherever necessary. The work is to be completed in about sixty days.

POMONA, CAL., will have gas-works built.

OAKLAND, CAL.—The Pacific Coast Electrical Construction Company has filed articles with the County Clerk.

SOMERSET, KY.—A natural-gas company has been organized. E. V. Bentley, of Wilmington, O., is president. The capital stock is \$250,000.

FORT WAYNE, IND.—Messrs. W. W. Worthington and R. C. Bell have submitted to the Business Men's Exchange a proposition looking to piping natural-gas to that city, as follows: "If a company should be found to pipe gas to Fort Wayne from our field, with a stock capital of \$200,000 paid up, we will put down in this territory, at our own expense wells sufficient to furnish thirty million feet of gas per day, convey to such company our leases for the territory where the wells are situated. We will also furnish the right of way for pipes from the wells to the corporate limits of the city, this company to lay the necessary pipes, and we will take in payment therefor ten thousand dollars (\$10,000) in money and one hundred thousand dollars in the capital stock of such company. This proposition shall remain open for acceptance for the next sixty days only.—W. W. Worthington, R. C. Bell."

RAILROADS, BRIDGES, CANALS.

HARRISBURG, PA.—Bids for paving Third Street with asphalt have been rejected.

NEWPORT, KY.—The Central Railway Bridge Company is soliciting permission to establish approaches for a bridge over the Ohio to Cincinnati. According to plans it will be a cantilever, 2,987 feet long.

PLATTSBROUGH, N. B.—At a recent special election a proposition to raise \$10,000 for paving the outer sections of the city was carried by a large majority.

JERSEY CITY, N. J.—The Pennsylvania Railroad Company has filed plans with the Board of Public Works for the proposed elevated railroad structure for their trains.

BRIDGEPORT, CONN.—The Board of Aldermen has accepted the report of the Board of Public Works in relation to a new iron draw and bridge in place of what is known as the Lower Bridge, and have voted to appropriate \$80,000 therefor.

TRENTON, N. J.—Justice Bradley, of the U. S. Supreme Court, has decided that the State of New Jersey has no power to prevent the construction of the bridge over Arthur Kill, between the State of New Jersey and Staten Island. The work is going forward rapidly.

DENVER, COL.—The Board of Aldermen have passed an ordinance providing for the building of the Nineteenth Street bridge at a cost of \$35,000.

HARRISBURG, PA.—A charter has been granted to the Penn Bridge Company, of Beaver Falls; capital \$10,000.

COHOKS, N. Y.—The Water Board has granted a contract for three iron bridges to the Canton Bridge Company at \$1,650.

RAILROAD.—The appraising of land for the railroad from Locust Valley to Oyster Bay, L. I., is about completed, and it is expected the Long Island Railroad Company will soon begin work on the line.

ERIE CANAL.—The Canal Convention at Rochester, N. Y., last week passed resolutions favoring the Seymour plan of lengthening locks and increasing the depth to seven feet. There is appropriated by the State over \$500,000 for work on the canal in 1887.

UNION SPRINGS, ALA.—Address T. H. Mabson in regard to a street railway here.

OMAHA, NEB.—Hopkins & Scully, of St. Louis, contractors for the bridge over the Mississippi River, will begin work at once.

Advertisements for the paving of Broadway will be published at once.

BRIDGE.—The Hamilton, Ont., Bridge Company has been given a contract for an iron bridge over the River Thames, between the counties of Elgin and Middlesex, Canada.

NEW YORK CITY.—Work has begun under direction of Colonel Walter McFarland, U. S. Engineer, on the improvement of the Harlem River and Spuyten Duyvil Ship Canal. No proposals will be issued until definite information as to the character of the excavation is obtained.

MENOMINEE, MICH.—A city election will be held August 8 for the consideration of bonding the city \$50,000 to assist the building of a bridge across the Menominee River. On August 19 Marinette, Wis., holds an election for the same purpose.

AUSTIN, MINN.—The County Commissioners have decided to build three iron bridges; total cost, \$7,800. Bids for piping the new water-mains have been advertised for.

TORONTO, ONT.—The City Engineer has presented his estimate of the cost of paving Jarvis Street, placing it at \$70,000. The report was adopted by Council.

PUEBLO, COL.—Our correspondent writes that \$31,000 worth of bridges are to be built here after plans by Messrs. Lowrie & Aulls, of Denver, Colorado. One bridge is to have a 40-foot roadway and 160-foot spans.

BRIDGE.—The Chicago, Burlington and Quincy Railroad has closed a contract with the Union Pacific Bridge Works for another bridge across the Missouri below their own bridge at Plattsmouth, Neb., to connect their Red Oak and Hamburg division with the line from the river at Nebraska city through Lincoln. The line now runs eleven miles up the river to East Nebraska City, directly opposite, but a cut-off will probably be built from Shenandoah through Sydney to the river. It is reported that committees have been appointed to arrange terms of consolidation for this company with the Chicago, Burlington and Northern.

DUBUQUE, IOWA.—The C. B. & N. R. R. are contemplating the building of a \$20,000 railroad bridge. Major Mackenzie, Corps of Engineers, U. S. A., with other engineers are now looking into the question of location.

BIDS OPENED.

AKRON, O.—The following bids for steam-fitting and plumbing for Summit County Infirmary were received by the County Commissioners July 27:

D. F. Morgan, Akron, O., boilers separate, \$990; total, \$3,500.

John Robb, Akron, O., boilers separate, \$985; total, \$3,300.

L. Biggs, East Akron, O., boilers alone, \$988; only figured on boilers.

BOSTON, MASS.—The Boston Water Board received the following proposals on Wednesday: For two iron sluice-gates, 42 1/2 feet, the Whittier Machine Company bid \$740, and the Coffin Valve Company \$500 each; for six iron sluice-gates, 32 1/2 feet, the Whittier Machine Company bid \$600, and the Coffin Valve Company \$295 each; for two iron sluice-gates, the Whittier Machine Company bid \$452, and the Coffin Valve Company \$245 each; for one iron sluice-gate, 2 feet 6 inches by 2 feet 6 inches, the bid of the Whittier Machine Company was \$210, and that of the Coffin Valve Company \$95; for one iron floor at the Chestnut Hill pumping station the Whittier Machine Company bid \$290, and the Coffin Valve Company \$202; for seven 20-inch stop-cocks the Whittier Machine Company bid \$255, and the Coffin Valve Company \$400 each; for six 24-inch stop-cocks the Whittier Machine Company bid \$260, and the Coffin Valve Company \$300 each; for six 30-inch stop-cocks the Whittier Machine Company bid \$195, and the Coffin Valve Company \$200 each; for two 24-inch check-valves the Whittier Machine Company bid \$485, and the Coffin Valve Company \$525 each. The total bid of the Whittier Machine Company was \$14,017, and the Coffin Valve Company \$10,717. The contract was awarded to the latter.

CHICAGO.—Bids were opened August 2 for the electric light plant for the Chicago River. The specifications called for dynamos, lamp fixtures, six miles of wire, and the necessary power to be located in a building at the north-west corner of Washington and Clinton Streets. One hundred double carbon American arc lights of 2,000 candle-power each were specified. There were several bids and the plant will cost less than Professor Barrett's estimate, although the cable will cost rather more. Cowl & Van Denberg offered to furnish the dynamos for \$6,500; S. S. Badger, dynamos, \$7,457. The Chicago Arc Light and Power Company offered to furnish the complete outfit for \$35,000, including power, dynamos, etc., etc. This company also offered to rent the lights at 45 cents per lamp per night, winter and summer. This is thought to be cheaper than any previous offer, and is better than the city's contracts with the gas companies. The United States Electric Company offers the cables at \$14,575. The Fort Wayne Jenny Electric Light Company offered the complete plant, according to the full specifications, at \$35,500. The Brush Electric Company made bids on the dynamos and cables, with three different systems, aggregating respectively \$12,847, \$13,182, and \$13,560. The Western Electric Company offered the plant, exclusive of the circuit, for \$11,045. The Ball Electric Light Company, of New York, offered the cables for \$14,200.

VALPARAISO, NEB.—The following bidders have been awarded contracts in connection with the construction of the water-works: National Tube Works Co., New York, and McKeesport, Pa., pipe and specials, \$3,460; Nebraska Planning Mill Co., Lincoln, Neb., tank, \$673.50; B. S. Clerk, Ashland, Neb., excavating and laying pipe and furnishing drydriants, valves, etc., \$1,350. The city builds its own house and furnishes machinery.

BALTIMORE, MD.—The Northern Central Railway Company have awarded contracts for building new piers and warehouses at Canton to cost nearly \$200,000. The present piers (3 and 4) are to be extended back 700 feet to Clinton Street, where they will end in a bulkhead. The total length when finished will be about 1,500 feet. To extend the piers 700 feet back, that length will be dredged to a depth of twenty-seven feet and 150 feet wide. A large warehouse will be built north of No. 2 elevator 270 feet long, seventy feet wide and three stories high. Andrew Brown and J. F. Adams have been awarded the contract for building the piers, the American Dredging Company, of Philadelphia, the dredging, and Jones & Henner the warehouse and shedding.

NEW YORK CITY.—The Aqueduct Commissioners awarded, August 3, the contract for building shafts 20 and 22 to Caldwell, Wilcox & Co. The contract for building the gatehouse and blow-off at Ardeley was given to O'Brien & Clark at \$4,900.

HAGERSTOWN, MD.—The contract for steel cells for Washington County Jail has been given to the Pauly Jail Building and Manufacturing Company, of St. Louis, at \$7,000.

ROCHESTER, N. Y.—Contracts have been awarded by the Executive Board as follows: Ray Street stone sewer, William Fuller, \$13,079.90, estimate, \$15,000; Hawley and Seward Streets pipe sewer, William Howe, \$2,115.25, estimate, \$2,500.

BOSTON.—Proposals for furnishing the dressed granite required to complete the main building of the new court-house were opened August 2 by the commissioners. The contract has not yet been awarded, and will probably not be announced for a few days. It is estimated that about 140,000 cubic feet of granite will be required for the purpose. The bids are as follows: Granite Railway Company, \$347,700; Sweat & Davis, \$335,000; Halliwell Granite Company, \$325,642; Mt. Waldo Granite Company, \$317,500; Cape Ann Granite Company, \$313,195; Davis Tillson, \$305,500.

ALLENTOWN, PA.—The Board of Water Commissioners awarded contracts August 2 for work required to construct the new water-works at the Fountain House. For building the stack the bidders were Tighman, Ochs & Son, who offered to do the work for \$2,179.22, and Leonard Seifing, whose figure was \$3,500. The contract was awarded to Ochs & Son.

R. D. Wood & Co., of Philadelphia, proposed to furnish 2,700 feet of twenty-inch supply-pipe at the rate of \$55.20 per ton, delivered at Allentown. The firm being the only bidder, the contract was awarded to them. To furnish and erect two steam-boilers of eighty horse-power each, there were three bidders, as follows: Knowles Steam Pump Company, of New York, \$3,597.75; Tippet & Wood, of Philadelphia, N. J., \$3,100; Abel Heilman, of Allentown, \$3,201.66. The contract was awarded to Mr. Heilman.

BROOKLYN.—Two proposals have been sent in for the establishment of a laundry in the female prison of the county jail by Gateson & Son, for \$80, and by Charles E. Hartshorn, Jr., for \$68. Three proposals were handed in for certain alterations to the boilers and heating apparatus in the jail, as follows: Peter J. Donohue & Son for \$1,060; Lawrence Tivey for \$1,020; Felix Campbell for \$980. All proposals were referred to the Committee on Contracts for examination and report.

PHILADELPHIA.—Director of Public Works Wagner has awarded the contract for covering the bottom of the south division of the new East Park Reservoir and the inside slopes of embankment to within 20 feet of the top with a coating of concrete 5 inches in thickness, and from thence to top of the slopes with bricks laid on edge in cement 2 inches thick. The bottom containing 10,723 square yards, and the slopes 14,208 square yards; and also for lining entire reservoir with brick embedded in cement. The bidders were Harry McTague, \$1.23 per square yard for the concrete lining and \$2.30 per square yard for the brick lining; John M. Mack, \$1.15 for concrete and \$2.60 for brick; Charles H. Large & G. Paist, \$1.23 for concrete and \$1.66 for brick; Charles J. Kennedy, \$1.80 for concrete and \$2.20 for brick; Louis Grant, of Pottsville, \$1.90 for concrete and \$1.20 for brick; Vulcanite Paving Company bid \$1.33 and \$1.43 per square yard for concrete and \$1.31 and \$1.43 for brick. Louis Grant, of Pottsville, was awarded the contract, the total cost of which will be about \$57,000.

CLYDE, N. Y.—Bids for laying a vitrified pipe sewer were opened by James Shanahan, State Superintendent of Public Works, August 3, as follows: James Robinson of Rochester, \$1,206.30; Matthew Dillon, of Rochester, \$1,665.80. The contract was awarded to Robinson.

GOVERNMENT WORK.

WASHINGTON, D. C.—Bids were opened at the Navy Department July 30 for the purchase of condemned vessels. The following are the highest amounts offered:

Burdette Pond, Meriden, Conn., \$18,255 for the Powhattan; Thomas Butler & Co., Boston, Mass., \$15,900 for the Ticonderoga; W. T. Garrett, San Francisco, \$18,002 for the Shenandoah; \$18,003 for the Lackawanna; \$16,501 for the Wachusett; W. E. Mighell, San Francisco, \$4,520 for the Cyane. There was no bid for the Tennessee. All the bids are above the appraised value of the vessels.

WASHINGTON, D. C.—Bids were opened at Colonel Thomas Casey's office August 3 for furnishing and erecting iron-work for fence and gates, and court-yard stairs for the west wing of the State, War, and Navy Department building as follows: Becham & Middleton, of Washington, \$1,515; Champion Iron Fence Company, of Kenton, Ohio, \$1,112; Poulson & Eger, of Brooklyn, \$3,650; George White & Sons, of Washington, \$1,800; Manly and Cooper Manufacturing Company, of Philadelphia, \$1,336, and Charles White & Co., of Washington, \$1,748. The contract will probably be awarded to the Champion Fence Company, the lowest bidders.

JAMES RIVER, VA.—Col. W. P. Craighall, U. S. Engineer, has presented his report on the James River Improvement. He says the width to be given to the channel is 400 feet from the sea to City Point, 300 feet from City Point to Drewry's Bluff, and 200 feet from thence to Richmond. Work on the project will be suspended in December next. It is estimated that \$4,386,070.45 will be required to complete the work, of which \$400,000 can be profitably expended during the next fiscal year. There is now available for the continuance of the work until December \$101,942.12. Col. Craighall's report incloses a statement from C. P. E. Burghwyn, who has charge of the James River improvement. He states that frequent complaints had been made of vessels grounding at Kingsland Reach, and a careful survey was made of the locality, which revealed the fact that the dredge channel had been filled. Bids to restore channel were called for, and the contract subsequently awarded to James Caler & Sons, who abandoned the work after excavating 653 cubic yards. The contract was then turned over to George E. Ward, who removed 18,017 cubic yards of sand, 54 boulders, 15 logs, and some wreckage.

HARBOR WORK.—Captain C. W. Palfrey, U. S. Engineer, has made his report to the Secretary of War on the improvement of Lake Ontario harbors. For Oswego harbor, he recommends the maintenance of the existing west breakwaters, the removal of the east breakwater and the building of one spur crib 150 feet in length. He estimates the expenditure during the next fiscal year for repairs at \$45,000; for spur crib, \$30,000; for removal of east breakwater, \$15,000; for contingencies, \$18,000. He recommends the maintenance of the existing works and channel at Little Sodus Bay, N. Y., and submits estimates of \$20,000 for repairs and \$4,000 for contingencies. For Great Sodus Bay, N. Y., Captain Palfrey recommends the maintenance of existing works, and the dredging of the entire space between the piers to hard bottom, and thereafter the dredging of a channel 200 feet wide and 15 feet deep at entrance low water. He submits estimates of \$27,500 for repairs, \$30,000 for dredging, and \$11,500 for contingencies. He recommends for Charlotte, N. Y., the maintenance of existing piers, removal of decayed guide poles, and dredging to fifteen feet at extreme low water, both between piers and across the outer bay. He estimates that \$67,800 can be profitably expended in this work during the next fiscal year.

CHICAGO.—Major Hanbury, of the Engineer Corps, U. S. A., has presented his report to the Secretary of War on the harbors in his territory. He says that some of the breakwaters of Chicago harbor should be rebuilt of stone in place of the present wood. At Calumet harbor about \$20,400 will be required to complete the improvement. He advocates a large outlay on the Illinois River improvements.

ABSTRACT of proposals received and opened by Major Thos. H. Hanbury, Corps of Engineers, U. S. A., at Chicago, Ill., July 29, for dredging in the Calumet River between the Forks and one half-mile east of Hammond, Ind.:

Robert Finch, Grand Haven, Mich., 25 cents per cubic yard.

Green's Dredging Co., Chicago, Ill., 35 cents per cubic yard.

Samuel O. Dixon, Racine, Wis., 11 cents per cubic yard.

F. R. Crane, Chicago, Ill., 21 cents per cubic yard.

Dodge & Petrie, Chicago, Ill., 23 1/4 cents per cubic yard.

POTOMAC FLATS IMPROVEMENT.—Colonel P. C. Hains, in charge of the Potomac Flats Improvement at Washington, reports that the work already done has benefited the health of the city, and that the continuance of the work will be of still greater benefit to the city's sanitary condition. He recommends an appropriation of \$600,000 to continue the work. He also suggests the entire remodeling of Long Bridge and calls attention to the almost useless conditions of Forts Washington and Foote.

SYNOPSIS of bids for iron-work of the roof, attic floor-beams, etc., for Court-house, etc., Leavenworth, Kan., opened by Supervising Architect July 28, 1887: A. J. Tullock & Co., \$9,150; Haugh Ketcham & Co. Iron-Works, \$11,500.

DRY-DOCKS.—The contract for the timber dry-docks at the Brooklyn and Norfolk Navy Yards has been given to Sampson & Co. at \$1,061,000. The docks will be 500 feet long. We have already published the bids.

SYNOPSIS of bids for carpentry work, roof, sheathing of floors, hardware, etc., for Post-Office, etc., at Lexington, Ky., opened by Supervising Architect August 1: Harris & Co., Newport, Ky., \$8,027; George Clark, Lexington, Ky., \$7,839; John Mitchell, Louisville, Ky., \$9,145.

SYNOPSIS of bids for fire-proof safes, as follows, opened July 30, by the Supervising Architect:

Fire-proof safe, with burglar proof chest, for Deputy Collector's Office, St. Paul, Minn.—Hall Safe and Lock Co., \$340; Miles & Hale (No. 32 Detroit Safe), \$348; Miles & Hale (No. 33 Detroit Safe), \$395; Mosler, Bowen & Co., \$366.

For Post-Office, Greensborough, N. C.—Mosler, Bowen & Co., \$353.36; Marvin Safe Co., \$355; Farrell & Co., \$556.

For Assistant Treasurer's Office, Boston, Mass.—Mosler, Bowen & Co., \$177.50; Farrell & Co., \$286; Damon Safe and Iron Works Co., \$290; Marvin Safe Co., \$198.

For Deputy Collector's office, at New York.—Mosler, Bowen & Co., \$662.50; Farrell & Co., \$675; Marvin Safe Co., \$550; Herring & Co., \$975.

For U. S. Government Building, at Norfolk, Va.—Mosler, Bowen & Co., \$450.72; Marvin Safe Co., \$563; Farrell & Co., \$738.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 11. } PUBLISHED EVERY SATURDAY.

NEW YORK, AUGUST 13, 1887.

LONDON, AUGUST 27, 1887.

SINGLE COPIES, TEN CENTS.

SINGLE COPIES, SIXPENCE.
Subscription, 20s. per annum in advance, post paid. } IN GREAT BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 94 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed — & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

MASSACHUSETTS WATER-SUPPLY.

PERHAPS the most important duties imposed upon the reorganized State Board of Health of Massachusetts are those provided for by the "Act to protect the purity of inland waters," passed in 1886, on the recommendation of the Massachusetts Drainage Commission and giving the Board supervision of the water-supplies and sewage disposal of the cities and towns of the State.

The first report of the new board, now before us, is of special interest as indicating the course which it will probably pursue in regard to this exceedingly important subject. Its first step is a wise one; it has organized an engineering department, consisting of Joseph P. Davis, consulting engineer; F. P. Stearns, chief engineer, and X. H. Goodnough, assistant. The report states briefly the questions already submitted, including the sewerage of Medfield, Winthrop, Taunton, and other towns, and the water-supply of Bradford and Boston.

Speaking of the Merrimac River water, it is noted that "in 1873 the impurities added by the sewage of Lowell were so modified by dilution and by a flow of nine miles that the water at Lawrence above the city was, according to chemical analysis, as good as that above Lowell, but that in 1886, with substantially the same quantity of water flowing in the river, the percentage of impurities, as shown by the albuminoid ammonia, has increased above Lowell by 36 per cent. and above Lawrence by 57 per cent., and that the impurities poured into the river at Lowell are now greater than the exposure to the air in flowing nine miles and the increased dilution can overcome, leaving the water above Lawrence with 12 per cent. more of impurities, due to animal and vegetable putrefaction, than that above Lowell, and 57 per cent. more than it contained when the water-works were established at Lawrence, and now approximating the undetermined border line beyond which the water would be unfit for drinking." This is a striking proof that it is full time that the State took some action in regard to these matters. As the Board remarks: "A gradually increasing mass of pollution suddenly reaches a point at which the stream is no longer able to neutralize it, either by dilution or by any of the so-called processes of oxidation, and a condition of things may be arrived at as disgusting as that of the Blackstone at Millbury, or of Alewife Brook in Cambridge and Somerville, or of the North River at Salem." In no one of these instances was the introduction of sewage a nuisance originally, and in no one of them would it have been possible to say in advance just where the saturation point would be reached.

In addition to the proposed systematic analyses of water-supplies throughout the year, which has already been noticed in THE SANITARY ENGINEER AND CONSTRUCTION RECORD, the board proposes to make a series of investigations on the disposal of sewage by irrigation to obtain definite knowledge as to the area of land required for this purpose, and the results can hardly fail to be of great practical interest and importance.

LONDON SEWAGE DISPOSAL.

THE Metropolitan Board of Works is making extensive and costly preparations for treating the sewage of London by a chemical precipitation process, and for disposing of the resulting

sludge by carrying it beyond the Nore in ships specially constructed for that purpose and dumping it into the sea. These works are intended to have an ultimate capacity for treating about 150,000,000 gallons of sewage per day, the product of about five millions of people. The amount of sludge to be disposed of daily is reckoned at between three and four thousand tons, and each ship is to have a capacity for 1,000 tons.

The chemical process to be used was described by Mr. W. J. Dibdin in a paper read before the Institution of Civil Engineers in January last, and consists essentially in the use of lime and sulphate of iron. At the same time a paper was read by Mr. W. S. Crimp on "Filter-Presses for the Treatment of Sewage," in which he took the ground that such machines solve the question of sludge disposal in sewage-precipitation works, and that the manure thus produced is equal, if not superior, to farm-yard manure.

The reading of these papers was followed by a long discussion, in which they were sharply criticised.

The *Builder* comments editorially upon this as follows:

"The essential point, to the inhabitants of London and to those interested in the commerce of the Thames, of what is to be effected by the present scheme of the Board of Works for the purification of the river, was, however, almost entirely blinked by the various speakers. Mr. Dibdin stated that the average London sewage at the outfalls contains 87 grains of foreign matter in the gallon, of which 27 grains are in a state of suspension and 60 grains in a state of solution. Assuming this to be the case, it follows, from the well-known analyses of which we have a large supply, that some 15 grains of suspended matter must either have been dissolved during the run of the sewers, appearing at the outfall in solution instead of in suspension, or that about the same approximate quantity had been deposited in the sewers by the way. The latter supposition is in accordance with the evidence, brought before the Committee on the Drainage of the Houses of Parliament, as to the cost and nuisance involved in clearing out the Metropolitan sewers by hand.

'Of yet more urgent importance is the question, What is the character of the effluent to be delivered into the Thames after the treatment now proposed? It is extraordinary to find no statement of this important feature of the case. Over the broad average of those cases of which the analyses are accessible, the mean result of the various modes of treatment employed has been the removal of about nine-tenths of the matter in suspension, accompanied by an increase of the matter in solution. If this rule applies to the London sewage, as described by Mr. Dibdin, the result of the precipitating process will not very materially benefit the Thames. That the difficulty of dealing with dissolved impurities is far greater than that which occurs as to suspended matter, is evident from Mr. Dibdin's table, which shows the different effects of the same dose of lime applied to, as far as appears, the same kind of sewage. This is shown to remove, in one instance, two per cent., and in another twenty-six per cent., of oxidizable matter in solution. With such wide differences, not as stated by opposing authorities, but in the same table, it is evident that all discussion is entirely in the air without some definite statement as to the effluent actually produced by the process which throws down 4,620 tons of sludge per day, although removing only 337 tons of dry foreign matter from the sewage.

"To another point of primary importance an equal want of due attention was betrayed in the debate—that is, the secondary action of any such admixture of lime and salts of

iron as is now proposed by Mr. Dibdin. As to this there is ample evidence. Mr. Latham stated in the debate that 'at Northampton iron salts were used in the proportion of $4\frac{1}{2}$ grains per gallon to 15 or 16 grains of lime, with the result that the river was as foul after treatment as before. The sewage at the outfall-works was made to appear clear, and the river seemed to be inoffensive; but after it had flowed a short distance, it began to turn, and was soon as black as ink, one putrefying mass.' Nor is this experience confined to Northampton, or to the action of either persalt or sub-salt of iron on lime. At Bradford, at Clifton, and at Cheltenham the same thing has occurred, chloride of iron being used in some instances, and sulphate of iron in others. That a small quantity of lime in solution may be more effective than a much larger quantity in suspension is not a new discovery. Whether Mr. Dibdin has or has not allowed enough is a matter that will have to be brought to the test, not of opinion, but of fact. But that reaction of a most offensive nature may take place when small quantities of lime are used with apparently good results at first, is indisputable. At Hertford the exact quantity per gallon now proposed by Mr. Dibdin was applied to a very weak sewage. The result was that the effluent contained absolutely more foreign matter per

nitide and importance, and it is, therefore, not surprising that we find eminent men in both professions arrayed on opposite sides, it certainly seems as if the main point in the above criticism of the *Builder* is well taken—namely, that sufficient evidence has not been collected as to the influence which the outfall from the works will have on the River Thames, which is, after all, the great point of interest.

WATER-SUPPLY FOR WATCH HILL, R. I.

WATCH HILL, R. I., has natural advantages and attractions possessed by few summer resorts on the Atlantic coast. We are glad, therefore, to note in the *New York Tribune* that a proposition to extend the water-mains from Westerly is under consideration, so that for a water-supply wells and cisterns need no longer be relied on. Where other sources are impracticable of attainment these may be tolerated, but they are always attended by the element of danger—contamination. The Watch Hill hotel proprietors and cottage owners should therefore promptly avail themselves of this opportunity to eliminate it.

In explanation, it is stated that the peculiar work for which the pump is intended is pumping water from an un-worked colliery direct into the main, the special action of the Worthington permitting a regular flow of water without undue pulsations in the main.

A new system of timber drying (Jennings') is in operation at Liverpool. Air is conducted over red-hot pipes until the moisture is evaporated, after which it is driven, at a temperature of 75° Fah., into the chamber containing the timber. There is a constant current of the dried air, which is operated on by the furnace again and again, until the moisture is extracted from the timber. There is, of course, no desiccation of the timber by the process.

The "Great Eastern" steamship, which was originally destined to perform such wonders, is becoming a nightmare to Harbor Boards. It was proposed two years since to take the leviathan to New Orleans during the World's Fair, and make a floating hotel of her, but the contract fell through. Since that time she has been on exhibition by a firm of Liverpool drapers on the Mersey, but after breaking her moorings and doing some damage, the Liverpool

A HOUSE AT MORRISTOWN, N. J.—GEORGE E. HARNEY, ARCHITECT.

gallon than the original sewage, and that an abominable nuisance was created lower down the river, at Ware.

"What public opinion will expect of the Metropolitan Board of Public Works, before they make any further heavy demand on the ratepayers, we take to be this: first, to explain what effluent they propose to turn into the Thames; and secondly, to show what proof they adduce that the proposed treatment will not, by the secondary action of lime and iron, leave the river nearly as foul as it was before. If we take the figures cited by Mr. Dibdin, 13 per cent. of 20 grains, that is to say 2.6 grains, of dissolved organic matter will be removed from the sewage by the proposed process; add to this 90 per cent. of the total suspended matter, which comes to 24.3 grains, and we find that, from a total of 87 grains of impurity, 26.9 grains will be removed, leaving the effluent charged with 60.1 grains of foreign matter, plus so much of the 4.7 grains of precipitant as have not been thrown down. If that be the case, the effluent will still be much fouler than the sewage which, in many towns, has been found to be intolerably offensive. And there remains the question, why will such an admixture of lime and salts of iron as has been found to produce an intolerable nuisance wherever put in practice hitherto, prove innocuous in the Thames?"

While it cannot be expected that there should be agreement between chemists and engineers as to the best means of dealing with a problem involving so many conditions and of such mag-

OUR BRITISH CORRESPONDENCE.

Congratulatory Memorial to Mr. Thomas Hawksley—The Worthington Pump in the English Market—New System of Timber-Drying—The Steamship "Great Eastern."

LONDON, July 20, 1887.

A COMMITTEE has been formed, with Sir Frederick Bramwell as Chairman and Dr. W. Pole as Secretary, for the purpose of presenting Mr. Thomas Hawksley, the well-known hydraulic engineer, with his portrait and a congratulatory memorial on his attaining his eightieth birthday. A party of gentlemen, headed by the Attorney General, waited upon him on Tuesday, the 13th inst., complimenting him upon his useful labors and congratulating him on his continuous health.

THE Worthington pump is again to the fore, causing trouble as an interloper in the English market. It will be remembered that there was considerable discussion respecting the Soudan contracts for these pumps. During the recent drought in Swansea, a special Worthington pump was cabled for from America, the fact arousing considerable interest on the part of English pump

Harbor authorities, after considerable trouble, got her to "move on," and she is now on the Clyde at Glasgow. It remains to be seen how long the Scots will tolerate her. Possibly not long if she does the proverbial "saxpence" of damage.

SAFETY-VALVE.

OUR SPECIAL ILLUSTRATION.

HANAN & SON'S SHOE FACTORY, NEW YORK.—BABB, COOK & WILLARD, ARCHITECTS.

THE subject of our special illustration this week is Hanan & Son's Shoe Factory, corner of Centre and White Streets, New York City. It is built of brick. Babb, Cook & Willard, of New York, are the architects.

OUR VIGNETTE ILLUSTRATION.

A HOUSE AT MORRISTOWN, N. J.

OUR vignette illustration is of a house at Morristown, N. J. It is built of wood, filled in with brick, covered with clapboards the first story, and shingles above; slate roof, stone foundation. Main hall finished in ash, other portion of house pine, painted. Parlor ivory-white. Cost, about \$10,000. The architect was Mr. George E. Harney, of New York.

THE NEW CROTON AQUEDUCT.

No. XIV.

(Continued from page 41.)

TIPPLE FOR DUMPING CARS.

A TIPPLE is a mechanical device designed to secure facility in dumping the contents of "tunnel cars" (when loaded with stone and debris) from an elevated platform into "dump-cars" located under it for receiving such material. The form of tippie now to be described is in use at shafts Nos. 22 and 23 of the new Croton Aqueduct, and also at shaft 18½, though slightly modified in form. At shafts 22 and 23 there are two styles of cars in use, the larger one, or "dump-car," holding 2½ cubic yards, intended for transferring material received at head-house from tunnel excavation to the dump or spoil-bank. This car is run on a track having three feet gauge and drawn by mules. The small or "tunnel" car will hold one cubic yard, and is filled with stone and debris at points in the tunnel where material excavated may require, drawn also by mules on a track of two-feet gauge to the foot of shaft, then elevated to head-house by means of a cage and delivered at the elevated platform, thence run on the tippie by two men who dump the contents into the dump-car as illustrated in Fig. 1, located under the platform for that purpose. When the car is run in position on the tippie portion of the platform, two hooks suspended from a windlass by ropes are inserted into openings made for that purpose in the end board of the tunnel car; this windlass is then turned by hand-power, which draws the board up out of the way. A chain, shown in Fig. 2 at *c*, is hooked into an eye set in the frame of car at rear end, bolt *c* moved back, then the car can be easily tipped and contents deposited into dump-car below.

Figure 1 is a general view of head-house over shaft and platform, showing position of small car when contents are being dumped into the large car standing on the track below the platform. A similar platform and tippie is located on opposite end of head-house.

Figure 2 is a plan of the upper surface of platform; *a*, a track on which car is run from cage to tippie; *b*, a guard-timber bolted at centre to tippie platform, and further secured in position by turning the ends of rails in a vertical position after passing under guard-piece *b*, as shown at *a*, Fig. 3. Iron plates ½x3x11 inches are indicated by heavy lines at *b*, Fig. 2, and bolted to guard-timber to protect it from wear of the car-wheels. When not in use the tippie is held secure in position by the flat iron bolt *c*, which is ½x3½x16 inches, and is held in position by two iron straps bolted to platform, shown in section at *d*. At *e* an iron plate is represented also bolted to platform, to which a chain is attached about four and a half feet long, having a hook on opposite end, which can be inserted into an eye fixed in frame-work of rear end of car when tippie is used, to prevent car from turning over.

The frame of this platform is made of twelve-inch timbers, supported at head-house by a plate 6x12 inches, bolted to the frame of latter, and on opposite end by a plate of similar dimensions, resting on two posts twelve inches square, but one of the latter is set at an angle of about thirty degrees from the vertical to give more room for box of dump-car. The length of platform is 15 feet 9 inches long, and width 8 feet 5 inches. The space five feet in length between head-house and tippie is covered with oak plank three inches thick. The portion of platform at side of tippie which is required to sustain only the weight of the men operating it can be covered with one-inch pine boards.

Figure 3 represents a longitudinal section of tippie which is four feet four inches square, composed of oak plank two inches thick, spiked to cross-pieces at each end, which are also of oak, one inch thick and eight or more inches wide. This platform revolves on a horizontal bar shown in plan by Fig. 4, and in section at *f* in Figs. 3 and 5. In Fig. 3 *g* represents a section of strap-iron two inches wide and half an inch thick, applied to secure *f*, which forms the axis, firmly in position. This is done by means of three-quarter inch bolts that pass through iron

FIG. 1

FIG. 4

FIG. 3

DETAILS OF TIPPLE
USED ONTHE NEW CROTON AQUEDUCT
N. Y.

FIG. 5

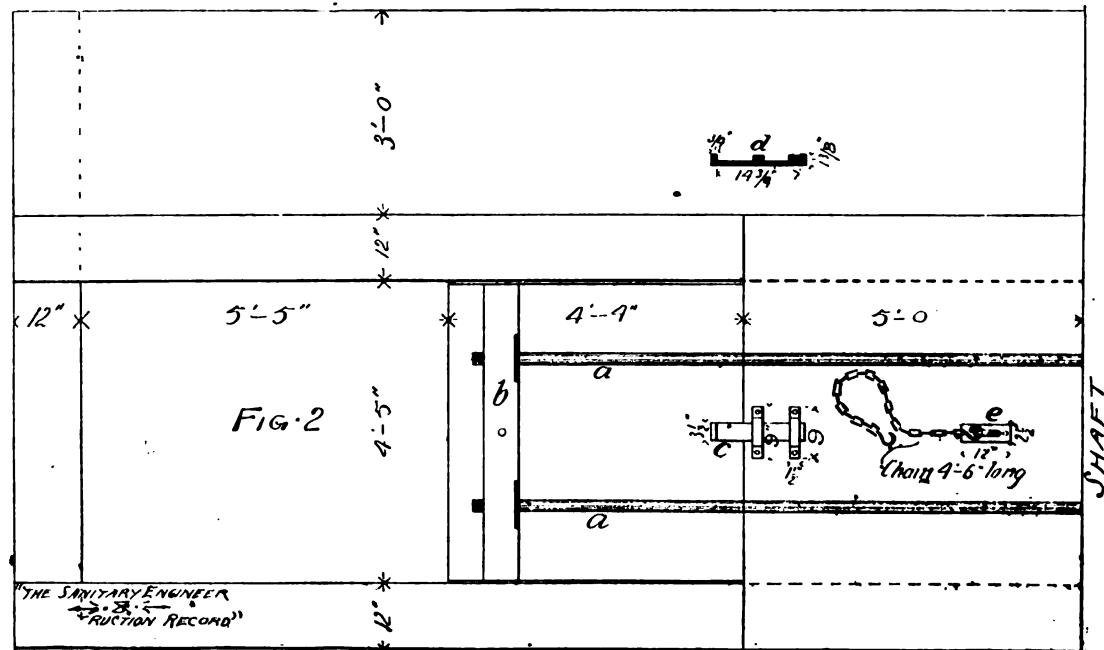

FIG. 2

strap *g*, oak piece *f*, and also platform of tippie, being still further secured by two one-half inch bolts, inserted at each end of strap-iron. The drawings represent only one iron strap, but in construction there are two.

Figure 4 is a longitudinal section of *f*, the axis of tippie, which is made of oak 4x7 inches, and cut out at *h h*, making it circular, which form the trunnions on which the tippie revolves, that are supported by two 12-inch timbers composing part of the frame of platform; the latter also are cut out on upper surface at *f*, Fig. 5, to fit the trunnions *h h*. A wrought-iron pipe 3½ inches in diameter may be utilized for a horizontal bar, and would be preferable to one of wood.

Figure 5 represents inner side of 12-inch timber, comprising part of platform frame, with relative position of tippie and guard. The tippie platform is canted about 1½ inches at rear end to modify centre of gravity in dumping the car and allow more freedom of action in the tippie. To prevent the tippie turning too far and dump the car, a

FIG. 6

THE NEW CROTON AQUEDUCT, N. Y.

guard is placed in position as shown at *i*, made of pine 4x8 inches and fitted between the platform frame, secured by iron hangers that are ½-inch thick and 1½ inches wide, bolted to the timbers on which trunnions rest. The broad side of the hangers are fitted to the timbers by twisting, as shown at *i*, and then secured by ½-inch bolts passing through both hangers and timber.

Figure 6 shows relative position of head-house and tracks at ground-level, the track *l* being utilized for the "dump-car" only in removal of material to spoil-bank. The inner track *k* is intended for the small or tunnel cars when building material such as brick, cement, etc., are required for construction in tunnel. The tracks for tunnel cars at shaft 22 extend to the head-house from the platform on which sand and cement is mixed dry (no water being added until delivered on the work in tunnel); and on opposite side from brickyard. The change in direction of car is made by a small turntable, placed opposite entrance, shown in Fig. 6, on which it can be easily turned and run on the cage in the head-house, and thence taken to any point in the tunnel where required.

The cars used on upper division are larger than tunnel-car described, only one size being used for delivery of building material, and removing stone and debris to spoil-bank, the entrance to head-house being only at ground-level. It is claimed for the plan of using both small and large cars that less number of trips are required to spoil-bank, thereby saving time of men, and the small tunnel-cars interfering less with workmen in the tunnel.

The tippie was designed by E. J. Farrell, of the firm of Rodgers & Farrell, Superintendents of Section 11, for Messrs. O'Brien & Clark, the contractors for sections 6 to 12, inclusive, of the new Croton Aqueduct.

PAVEMENTS AND STREET RAILROADS.

No. X.

(Continued from page 266.)

ASPHALT AND CONCRETE FOOT-PAVEMENTS.*

IN Archway Road, Hornsey, another experiment was made by covering the screed mark with a strip of mastic asphalt nine inches in width and ½-inch thick, just as in the last case with felt. For three months no cracks appeared; then a few slowly and at irregular intervals showed themselves; but during the severe winter of 1886-7 every screed mark showed its crack. These cracks were irregular in line, but they are confined in each case to the area covered by the mastic asphalt. These footways are laid on a 3-inch foundation of concrete. In Marlborough Road, Chelsea, an experiment was made on different lines. A foundation of concrete six inches thick was laid, and the compressed asphalt laid on it. For four months no cracks appeared, but after that time they occurred at frequent intervals, though they are fewer than usually appear on a 3-inch foundation. When the asphalt and concrete were removed at the cracks it was found that the crack extended through the whole thickness of the concrete. This experiment was based on the observation that cracks do not appear in compressed asphalt carriageways, and as the principal difference between the foundations in the footways and carriageways is the thickness of the concrete, it was assumed that it was the cause. The observation is, however, an incomplete one. In streets of light traffic the cracks do appear in the asphalt, as in Little Blenheim Street, Chelsea, and elsewhere. In streets of heavy traffic the cracks in the concrete tear the asphalt as they slowly form, but the traffic welds the asphalt together again before they show on the surface. In footways of heavy traffic there are fewer cracks than in those of light traffic, for a similar reason. At Muswell Hill, Hornsey, the experiment of covering the whole of the area of the footway between Onslow Rise and Grosvenor Gardens with bituminous felt was tried. The felt was in 3-foot widths, and was laid longitudinally with butt joints. At the circular kerb the pieces were necessarily somewhat patched. The result has been that cracks have appeared at every joint of the felt with marvelous fidelity, owing to the movement of the concrete. In Whitehead's Grove, Chelsea, between Marlborough Road and Keppel Street, on the north side, a length was laid in 1885 on a 3-inch concrete foundation, which was covered with mastic asphalt ½-inch in thickness. On this ½-inch of compressed asphalt is laid. The mastic asphalt was laid to absorb by its elasticity the movement of the concrete without transmitting it to the compressed asphalt. It has survived two winters of great severity, and has lived twenty-one months without any cracks appearing. From this it would appear that the principle of a material between the concrete and the compressed asphalt which will absorb the effects of the movements of the concrete is a correct one, and the writer invites the members of the association to experiment on cheapening the method. The present result is an increase of life of 33 per cent. at an increase of cost of 12 per cent.

As evidence of the durability of compressed asphalt in footways, those in Cheapside may be mentioned. They

were laid in 1876 at a thickness of 1 inch, and are now wearing through. On the south side of the Strand east of Wellington Street 1 inch of compressed asphalt was laid in 1881, and has had only the most trifling repairs. The streets in the city with the heaviest foot traffics in the world are paved with compressed asphalt on the footways.

The advantages of asphalt foot pavements are durability, a smooth surface unbroken with joints, a good foothold, even and regular wear, their impervious character, and the readiness and neatness with which they are repaired. They have a sombre appearance, and show water on their surface longer than stone pavements. They wear to the last thickness without breaking up, and give a useful wear for the whole of their thickness. When a stone or other pavement has worn 1 inch it may not be half worn through, but its usual life is over. Where there are cellars under footways, asphalt as a material for footways is unrivaled. In ordinary traffics, such as those named in King's Road (7,000 to 8,000 persons per day), an asphalt pavement can be laid 1 inch thick with the certainty that for at least ten years it will need no repairs whatever. This pavement has also the advantage that the foundation is always preserved and good for use again when the wearing surface of asphalt has to be renewed.

The following abstract of the present contract schedule in Chelsea will give the prices for these pavements:

	Persq. yd.
£ s. d.	
Compressed or mastic asphalt 1 inch in thickness on 3 inches of concrete.....	0 6 3
Ditto, ditto, ¾ inch thick.....	0 5 6
Compressed asphalt ¾ inch thick on ¾ inch of mastic asphalt, laid on 3 inches of concrete.....	0 7 0
Compressed or mastic asphalt 1 inch thick on existing concrete foundation (relay).....	0 3 6
Ditto, ditto, ¾ inch thick.....	0 3 0

These prices carry a guarantee of free maintenance for ten years. The vestry prepares the foundation for the concrete in new work at a cost of 2d. per square yard. The specification provides that the asphalt will be cut open at distances not exceeding 50 feet apart, and the thickness measured. Five out of every six of these measurements must be at least the specified thickness, and the average of every six must be at least the specified thickness. The specification is strictly adhered to. The cost of the foot pavement in New Bond Street, already referred to, over twenty-six years would be as follows at per square yard:

	£ s. d.
Preparing foundation.....	0 0 2
Laying concrete foundation and ¾ inch mastic asphalt.....	0 5 6
At end of 13 years relaying mastic asphalt (life 13 years).....	0 3 0
Repairs.....	0 0 0
Total.....	0 8 8

or a cost per year, not including interest, of 4d. per square yard. It should be mentioned that the small cost of renewing asphalt footways is due to the fact that the asphalt taken up is as good as new asphalt after it has been cleared and prepared, and is re-used for footways.

In dealing with the question of concrete as a material for foot pavements, the writer cannot claim such an experience of it as he has had with asphalt. In 1880, however, the Vestry of Chelsea had laid by the respective makers a series of pavements in King's Road against the Royal Military Asylum wall, and in 1885 a report was made on them by the writer. So many applications for copies have been made that it is now out of print, and as applications continue to be made, the results of the experiments are herein set forth for the information of the Association.

The writer holds that a knowledge of the manufacture of these pavements is useful information, and therefore he incorporates a description of the manufacture of imperial stone pavements. The depot of the company is at East Greenwich, on the banks of the Thames. The aggregate used by the company is broken granite. Flint has been used, but the pavement in wear became very slippery. Kentish rag has also been used, but its wear was too rapid. The granite is broken, so that it passes a 1½ sieve. After screening it is carefully washed, as the dust acts as a coat round the piece, and prevents the cement laying hold of the granite. The washing machine is a slanting archimedean screw, working in a trough, with openings in the thread of the worm. The water is run in at the high end, and the screened granite pieces put in at the lower. The screw churns the pieces over and over each other, and carries them up by its motion. The clean water meets the cleanest granite, and thus the pieces are not soiled by the dirty water they make. About 8 per cent. by weight is washed out as waste. The importance of a clean aggregate is seen when it is stated that briquettes made from washed pieces have a tensile strain of 15 to 20 per cent. higher than those made from unwashed pieces, when tested under similar conditions. The cement used is the best Portland, and is required to stand a tensile strain of 350 lbs. per square inch after seven days' immersion in water. As a matter of fact, the cement used runs to an average of 425 lbs. on the square inch. Hitherto a residue not exceeding 10 per cent. on a 50-mesh was allowed, but the value of increased fineness is recognized, and preparations are being made for a cement that will not leave a residue of 10 per cent. on a 76-mesh. The weight runs from 116 to 120 lbs. per struck bushel. Before use, the cement is laid out to cool for fourteen days, and is turned

frequently in that time. Great care is taken to keep the direct rays of the sun off the cement. The company exposed part of a sample of cement to the sun, and exposed the other part to the air. It was found that the part exposed to the sun showed loss of strength equal to 50 per cent.

The soluble silica used for the induration of the stone is a clear viscous substance made from pure flint and caustic soda, which are digested by heat under pressure in Papin's digester or an analogous machine. Its strength is technically known as 140° Twaddle, which shows 1,700 on a hydrometer. The silica is diluted with water until it shows 1,250 or 1,300 on the hydrometer, and is then a clear copper-colored liquid.

The stone is made of three parts by measure of washed granite and one part of cement. They are thoroughly incorporated in a dry state in a horizontal cylinder by machinery, and when this is secured, water is sparingly added, and the mixing continued. At each mixing there is made sufficient concrete for a 3'x2'x2' slab only. When it is ready for putting in the mold, the concrete does not appear to the eye to be sufficiently wet. The molds are metal-lined, true in shape, with clearly defined arrises. Before the concrete is placed into them they are oiled all over, and then placed on a trembler. This is a machine which gives a rapid vertical jolting motion to the mold. When the machine is started, the concrete is placed into the mold by small shovelfuls at a time, and two men with trowels spread it over the mold. When the mold is filled they pat the concrete with the trowels, the water rises to the surface and an even smooth face is secured. The mold and concrete are then removed to a rest for two days. The whole operation of mixing the concrete and making the slab in the mold is completed in six minutes. Machine-made stones are of necessity homogeneous, as veneering is impossible during the process. The slabs when taken from the molds at the end of the two days are air-dried for seven or nine days, and then immersed in a silica bath for seven or nine days more. They are then stacked in the open for some months before use. The value of the silica bath is in hastening the hardening of the stone. At the end of a month the stone will stand from 30 to 40 per cent. more tensile strain if silicated than if air-dried only. It is doubted by Mr. Faija whether silicating increases the ultimate strength of concretes.

The stone so prepared stands a tensile strain of 650 lbs. on the square inch when three months old. Strains of 1,000 lbs. have been obtained, but they are not the average. The value and excellence of this concrete is shown by the fact that though the neat cement has 75 per cent. of aggregate added to it, yet in three months the mixture bears nearly double the tensile strain of the neat cement after seven days. The writer was shown the original of a report by Kirkaldy, dated 6th September, 1882, in which one sample of stone took 8,075 lbs. per square inch to crush it, and another reached the marvelous strength of requiring 9,492 lbs. per square inch to crush it.

In the King's Road experimental pavements the makers laid their pavements with the knowledge that they were competing with their rivals. They were laid in 1880. Asphalt, York stone, Ferrumite stone, Victoria stone, and Imperial stone were laid side by side and subjected to the same traffics. The writer includes the York stone results, though not strictly coming within the subject of the paper.

In June, 1884, the Ferrumite stone was removed, as its slipperiness had become a source of danger. Its area was taken by Wilkinson's granite concrete pavement and by Shap-stone pavement. After five years' wear of the original stones, the following results were obtained:

The York stone occupied an area of 87 square yards; the original thickness was 3 inches; the number of stones 123, of which, after five years' wear, 10 had broken edges, 16 had broken corners, 21 had their surfaces peeling off, and 6 were worn so as to be dangerous. The wear was not measurable by reason of the uneven thickness of the stones, but it was unmistakable. The foothold was good in all weathers. The actual cost was 8s. 7d. per square yard laid.

The Victoria stone occupied an area of 81½ sq. yds.; the original thickness was 2 inches; the number of stones 168, of which 35 had broken edges and corners, two had their surfaces peeling off, and 3 were visibly cracked across. The wear was not quite ¼ inch at the greatest traffic line. The joints of the stone were pleasing, and the color cheerful. The foothold is not so sure as that of York stone in dry weather, and in a drizzling rain it approaches slipperiness. The cost was 6s. 4d. per square yard laid.

The Imperial stone occupied an area of 90¼ square yards; the original thickness was a full 2½ inches; the number of stones 187, of which 18 had their corners and edges broken, and one had its surface partly peeled off. The wear was not quite ¼ inch at the greatest traffic line. The regularity of the joints is pleasing to the eye, and the color is light and cheerful. The foothold is more sure than that of the Victoria stone sample, but it becomes somewhat slippery in drizzling rain. The cost was 6s. per square yard laid.

The experience gained with the Shap-stone laid in 1884 is more limited, but the stone does not appear to be better than the concrete stones described. The length laid *in situ* by Messrs. Wilkinson is subject to the same remark, but the aggregate is already wearing up. It is laid in 8-feet bays. A repair made in it is a great dissight to it. The effect of the traffic in wear is visible.

Mr. Walker, of Leeds, has laid down (1886) in King's Road a short length, in bays about 4 feet square. It has

* A paper by George R. Strachan, A. M., Inst. C. E., of Chelsea, London, S. W., read at the annual meeting of the Association of Municipal and Sanitary Engineers at Leicester, July, 1887.

a very smooth surface, and appears to be a very good pavement. He lays a foundation of ballast concrete $2\frac{1}{2}$ inches thick to within $\frac{1}{2}$ inch of the finished surface, and cuts roughly through it so as to form the bays. He then floats the surface with fine rich concrete, made of one part of cement to one or one and a quarter parts of crushed granite or slag which pass through a $\frac{1}{8}$ sieve. This is then cut through with a knife into bays of small areas. The foothold is fairly secure and the wear very satisfactory. No cracks appear when the bays are made less than 10 feet square. At 322 Oxford Street a piece has been down three years, and no wear is visible. He claims that his fine rich concrete on the surface attains more nearly to the texture of York stone than any other pavement. The joints, however, have a tendency to spread.

Concrete pavements laid in slabs have two serious disadvantages. The writer's experience refers to Victoria stone, but there is no reason to suppose that slabs of other make are free from them. The first is the annoyance caused by the hard metallic sound of the footfall on them, which is especially noticeable at night. The other is their brittle nature and the presence of hidden cracks after wear. When taken up to relay, it is often found that a stone which was apparently sound, breaks before it can be relaid.

Concrete pavements *in situ* have the serious disadvantage that they cannot readily and cheaply be repaired. A patch in them shows for the whole life of the pavement, unless a whole bay is removed.

The writer is of opinion that concrete pavements *in situ* are preferable to concrete pavements laid as slabs. There is, however, no reason why this pavement should not be laid by surveyors themselves, without the aid of a contractor. Much has to be learned before concrete as a material for foot-pavements is perfected, but that can most readily be learned by each engineer doing his own work, and exchanging experiences. The prices paid for concrete pavements are very great. One stone is advertised for 7d. per square foot, which equals £4 14s. 6d. a cubic yard. This is an extravagant price to pay for concrete, even if it be of the very best kind, and silicated, too. Concrete for foot-pavements has its own field, and within well-marked limits its use is advisable, but until its capabilities are more largely tried and its usefulness increased, the full advantage will not be obtained from it. The price stated is large enough to cover the cost of experimenting, and the writer trusts that the members will carry out such a series of tests and trials as will complete the knowledge of concrete as a material for foot-pavements.

THE DRIVEN WELL SYSTEM AS A SOURCE OF OR A MEANS OF OBTAINING A WATER-SUPPLY.*

(Continued from page 265.)

In order to determine the advisability of a district to furnish a supply of ground-water, the topography and geological formation must be carefully studied. If taken from porous strata, underlying impervious strata, then its outcrop must be carefully traced to determine the area to be depended upon, its elevation above the points from which it is to be taken, and the amount of water and the rapidity with which it will yield its stored waters. If it is to be depended upon as the only source of supply, then the storage capacity from the plane of the frictional grade of the ground-water and above the level from which it is to be taken must be equal to the maximum consumption during the months of the year when the percolation is less than the demand.

We have numerous instances of large amounts of water being thus obtained, and, as in many portions of our country the stratification is homogeneous in character with an outcrop covering large areas, the amount of water to be obtained can be closely estimated. The causes of failure are numerous and the work should only be undertaken after a careful testing of the capacity of the soil. Experimental wells should be driven and the effect continued pumping may have on the ground-water carefully noted.

If, by pumping, the level of the water is quickly drawn down and continues with a uniform yield and a quick recovery of the original level upon stopping the pumps, then it may be assumed that the storage area is small, but the supply is constant through an open strata.

If the yield should be equal to the capacity of the pipes without lowering the ground-water, then may the supply be assumed to be abundant. If the level is reduced slowly and has an equally slow recovery, it would indicate thereby a storage-reservoir without a material supply. It is found in about all drift formations that a layer of gravel or coarse sand, variable in thickness, lies just above the bed-rock. In this layer the freest flow of water can ordinarily be found.

The ground-water, when first drawn to the surface, is usually of a temperature of from 48° Fah. to 51° Fah., the

temperature of the ground, which approximates the mean temperature of the atmosphere for the year. If reinforced by surface-water, then the temperature is raised or lowered to the season of the year and the distance it has had to pass through the soil.

As compared with surface-water, it is less liable to contamination from organic substances and can be delivered at a lower temperature in summer and a higher temperature in winter.

The tube, or driven well, as compared with an open well, is usually driven to a greater depth and into various strata, and thus the water, from its slow filtration through the soil and partial oxidation, is less liable to pollution. If these strata should be more open than those in which the open well is placed, then would the friction be less, the circle of influence be enlarged, and the yield so much greater.

A series of driven wells located at such a distance apart as to draft upon the area within their limits, extends the circle of influence as far beyond that of the open well as the distance between the extreme wells is greater than the diameter of the open well; this is modified by the variable-ness of the strata from which each is drafting.

The driven well also has the advantage of being practicable in soil through which it would be impossible or difficult to construct an open well.

Probably the most successful plants of small tubular wells are those put in by William D. Andrews & Bros. for the city of Brooklyn, L. I., N. Y. The surface of the ground of the western portion of Long Island rises gradually from the ocean on the south to the ridge on the north. The slope has long flat lateral slopes crossing the general slope which serve as collectors of the excess of water over and above what the ground will absorb, which appears in the form of small streams and numerous ponds and swamps which serve to store the surface-water. The subsoil is for the most part sand and gravel of a homogeneous character.

The source of the Brooklyn water-supply is in streams, ponds, and open and driven wells. The grade of the ground-water is from seven to twelve feet per mile.

The average daily consumption for the year 1886 was about forty-five millions of gallons, with a maximum consumption of fifty-eight millions of gallons. Of this, twenty millions of gallons per day was supplied during the time of severest drouth from the driven-well systems. These wells are located parallel to the line of the conduit and across these small lateral valleys before mentioned. Spring Creek and Baisley Station, so-called, were constructed in 1882, and yielded over nine millions of gallons daily for several months in 1885.

The plant consists at each of these stations of 100 2-inch pipes driven with a patent well point.

The depth of the wells varies from forty to seventy feet. The elevation of the ground is about ten feet above tide-water. Experiments with test wells at Spring Creek did not show any effect upon the ground-water 2,000 feet away, but I am not informed as to how long the test was continued or to what level the water was drawn at the wells.

In 1884 Forest Stream and Clear Stream Stations were built. These stations averaged for eight months, in 1885, during the drought, over 10,500,000 gallons daily. There are 240 2-inch wells at these two stations. The depths and elevations of these wells are about the same as at the first stations.

I am informed that over 12,000,000 gallons per day have been pumped from these two stations, and constant pumping does not appear to have reduced the supply. Three open wells, fifty feet in diameter, which are placed in similar, or more favorable conditions to those of the driven wells, and sunk so as to have fifteen feet of water, will not yield over 1,000,000 gallons per day.

In 1875, at Long Island City, in the construction of a brick well, fifty feet in diameter, a large flow of quicksand was encountered which threatened its destruction, but a 6-inch pipe, driven in the bottom about thirty feet deep, concentrated the flow of water and no change has since occurred. The well supplied 500,000 gallons per day. Three 4-inch pipes were driven to about the same depth as the open-well pipe, and in opposite directions from it, at a maximum distance of 5,605 feet from the wells. These showed a yield of 40,000 gallons each per day in addition to that obtained from the well. These pipes were attached to the suction-pipe from the well. The claim for this arrangement was that the water in the well being drawn to a lower level than the ground-water acted as a syphon pipe, thus equalizing the draft.

I am informed by the engineer that the yield has increased rather than diminished. These pipes were driven with open ends and perforated with $\frac{1}{4}$ -inch holes for a distance of two feet from the end.

At East New York, a well fifteen inches in diameter and fifteen feet in depth of water yields between 200,000 and 300,000 gallons per day of twelve hours' working.

A 6-inch pipe was driven in the centre and three outside, at even distance from the well, about fifty feet, and attached to the suction as at Long Island City. The yield was brought up to one million gallons per day of twelve hours.

At Dayton, O., a series of nine 6-inch wells, driven forty to forty-five feet in the former bed of the Mad River, and cleared by the Wagner Steamed Well Process, gave a daily yield, in January, 1886, of 3,260,000 gallons.

At Franklin, O., six wells six inches in diameter, driven sixty to seventy feet deep, through twenty-six feet of gravel, one foot of soil, ten feet of clay and gravel, and twelve feet more or less of gravel, it is claimed yielded over 1,000,000 gallons per day.

At Texarkana, Ark., a set of ten wells was sunk about forty-five feet deep, through twelve feet of quicksand, thirteen feet of gravel, three feet of yellow sand and hard, tough clay, and eighteen feet of coarse gravel resting on a bed of fine sand. A test of twelve days' continuous run, yielding from 625 to 825 gallons per minute, lowered the ground water five feet, the water returning to its normal height in about four hours after the completion of the test.

At Terre Haute, Ind., a set of ten 8-inch wells, sunk about twenty-three feet, yielded 2,700 gallons per minute.

In our immediate neighborhood we have a number of plants which have been to a considerable degree successful, certainly more so than open wells or conduits could be expected to have been under the conditions.

At Hyde Park, Mass., in the valley of the Neponset River, at the foot of the Blue Hills, is located a plant of sixty-four 2-inch wells, placed so as to intercept the ground flow of the valley, and connected by 8-inch and 10-inch suction pipes to the pumps.

The pipes were perforated eighteen inches to two feet on the side and driven with open ends from twenty-two to forty-five feet deep.

The temperature of the water was uniformly 50° Fah., and 900 gallons per minute were discharged.

During a test continuing five days of ten hours' pumping, the vacuum gauge at the start showed ten inches vacuum, and at the close $15\frac{1}{2}$ inches, and a maximum variation of $2\frac{1}{2}$ inches per day was also shown. I am informed that the extreme variation in level of the ground-water 1,500 feet away was two inches.

At Cohasset, Mass., a set of sixty-five 2-inch wells, driven from twenty-two to forty-five feet deep through clay, sand, and gravelly sand, and connected by a suction-pipe varying from four inches to ten inches in diameter to a pump, yielded, in a test lasting five days, 450,000 gallons per day. The ground-water was lowered ten feet at the wells and $1\frac{1}{2}$ inches 1,500 feet away.

At the State Homeopathic Insane Asylum, at Westboro, Mass., thirty-three 2-inch wells were sunk about fifty-five feet deep, through a clayey sand into from four to eight feet of gravel overlying bed-rock, and yielded, on a two days' test of ten hours each, 450 gallons per minute. The level of the water in a test tube 150 feet from the well was lowered seven feet in ten minutes and held at this level during the continuance of the pumping, rising to its normal level five minutes after the pumps were stopped.

At Newton, Mass., near the pumping-station of the Newton Water-Works, a set of eight wells (four 4 feet and four 6 feet in diameter) were driven to a depth of from thirty to forty-five feet through meadow mud, clayey quicksand, and into from two to six feet of coarse sand and gravel.

A test of continuous pumping, lasting thirty-one days, was made in August and September, 1886, and showed a daily yield of 324,000 gallons at the start and 283,000 on completion. The level of the water in the test tubes located from fifty to one hundred feet from the pipe-line was lowered twenty to twenty-two feet in two hours, and returned to its normal level in less than twenty-four hours after the stopping of the pumps.

THE Maine State Board of Health has commenced the issue of a monthly journal called the *Sanitary Inspector*, edited by the Secretary of the Board, Dr. A. G. Young. It is a very dangerous undertaking, but it is to be hoped that it will be so managed as not to injure the cause of public sanitation or the reputation of the board.

*A paper by Albert F. Noyes, City Engineer, Newton, Mass., published in the Journal of the New England Water-Works Association for June, 1887.

COKE AS BUILDING MATERIAL.

A GOOD suggestion has been made in the *Architect* by Mr. S. Smirke, R. A., as to the use of coke as a building material. He points out that volcanic scoria or pumice was used in the construction of the vaulting of the corridors of the amphitheatre at Catania. The springings and various main ribs were executed in very sound brick-work, whilst the interstices, spandrels, and other parts of the vaulting were wholly executed with this light yet hard material, in its rough state, but run in solidly with Pozzolana cement. This mode of construction has proved to be substantial by the permanence of the work in these ancient corridors. The dome of the Pantheon at Rome was executed in the same manner, and has stood the sieges, earthquakes, and all other causes of damage and decay, for nearly two thousand years. He adds: "Perhaps I may be permitted to say that I think it worthy of inquiry whether a safe, permanent, perhaps even economical vaulting might not be similarly executed with coke, a material which has many of the proper ties of this volcanic scoria or pumice." We can assure Mr. Smirke that many gas managers with a big coke heap would only be too delighted to dispose of it to the heroic builder who would practically demonstrate the efficiency of coke as a building material.—*English Exchange*.

THE USE OF CORRUGATED IRON FOR COFFER-DAMS.

In a paper before the Institute of Engineers on the Harbor Works in Algoa Bay, Cape Colony, Africa, the author, William Shield, Esq., mentions this novel use of corrugated iron, and it is of sufficient interest to warrant its reproduction as follows: "Corrugated sheet-iron, No. 24 B. W. G. in thickness, formed the dams for the piers and south abutment, being stayed inside with timber framing, and weighted with rails so that the dam sank into the sand and gravel as the excavation proceeded inside. The dams for the piers were about forty-two feet long, six feet wide, and eight feet high; and they were perfectly water-tight. The author thinks that this, as he believes, novel use of corrugated iron will be found satisfactory and economical where, as in the present instance, clay is expensive and difficult to obtain of good quality."

LESSONS FROM RAILWAY DISASTERS.

MR. CHARLES LATIMER, late President of the Civil Engineers' Club of Cleveland, at the annual banquet, in his annual address, said:

"Disasters are great teachers. Two fearful holocausts in this country, one at Rio on the Baltimore and Ohio, the other at White River in Vermont, and a wreck yet more terrible near Boston, teach us many things, among others: Let us not encourage our men to drink whiskey by keeping open saloons at the eating stations. 2d. Let us not use timber boxes for cars, that is sleeping and day coaches, varnished and painted to burn as quick as celluloid or gun-cotton. 3d. Do not use open fires. 4th. Do not use explosives for fuel or light on cars. 5th. Put safety-guards on re-railing trains at each side of every bridge. 6th. Do not overwork men. 7th. Rest men, beast, and material one day in seven. 8th. Be sober, be vigilant. Some recent disasters point plainly to the necessity of electric lighting, and heating, which must occupy the highest talent of the educated or natural engineer, and which presents a prolific field for the talent of the members of this club, especially those who represent those branches."

Referring to the Panama Canal he said:

"It has been the opinion of many engineers that the Panama Canal will never be finished, that the cost will run up to 400 or 600 millions of dollars. I am not of this opinion. I feel confident that it will be finished from ocean to ocean within a very few years. I believe that the Nicaragua Canal will also be finished and make the most beautiful and delightful transit imaginable through a country of unexampled loveliness, through a charming lake of pure water whose height above the ocean is the same as the height of Chautauqua is above Lake Erie—that is 742 feet—and the cost may not exceed \$100,000,000. I believe that the Eads ship-railway across the Isthmus of Tehuantepec is practicable and will also be built."

A NEW KIND OF SANITARY SWINDLE.

In an English police court, a few weeks ago, a person who is described as a civil engineer and a young man of respectable appearance, was committed for trial on the charge of obtaining money under false pretences. This he did by offering to appoint people as sole agents for their locality for a Sanitary Protection Association which did not exist. In one place he seems to have appointed eight "sole agents" for his bogus association. This form of swindle has not yet been tried in this country so far as we know, but it may be well to remember its possibility.

THE July number of the *Journal of the Franklin Institute* treats on a widely-distributed range of subjects. Opening with an interesting article on "Plant Analysis as an Applied Science," showing how much chemistry has done for the economical development of plant products, the next article treats of the "Henry Draper Memorial," established at Harvard in 1886 by Mrs. Draper for the purpose of continuing his investigations in dry-plate photography. Illustrations are given of the spectra of stars obtained by this process, with descriptions of methods, and an outline of work yet to be done.

The "Use of Oil for Stilling Waves" gives many instances of the efficiency of oil for this purpose, and arrives at the conclusion that it is undoubtedly beneficial. The author, Mr. T. F. Townsend, closes by presenting engravings of a metal lubricator ten inches in diameter, to take the place of the ordinary oil-bag, and furnish a uniform supply of oil under constant control.

The next article is a continued one by Professor William Cain on "Long Columns," treating the subject mathematically.

"Ransome's Improvement in the Manufacture of Portland Cement" is concluded. The chief interest in this article is the description of the use of furnace slags as a compound of cements. Physical tests of cement from slag as manufactured by Ransome gave the following results:

Age of cement.	Portland cement $2\frac{1}{4}$ " area of section. Weight of cement, 123 lbs. per bushel.	Ransome's slag cement $2\frac{1}{4}$ " area of section. Weight of cement, 120 lbs. per bush.
2 days.	Strength, 570 lbs.	Strength, 740 lbs.
3 "	" 698 "	" 870 "
7 "	" 818 "	" 1,170 "
28 "	" 1,325 "	" 1,440 "

The last article is a "Note on the Discharge of Turbine Water-Wheels," consisting of a discussion on the methods of computation, by J. P. Firzel.

The usual Scientific Notes and Comments close the number.

NEEDLE WITH ADJUSTABLE WEIGHT FOR TESTING LIME AND CEMENT.*

By means of a needle the setting of cements and hydraulic limes can be tested with varying weights.

The instrument consists of a tube terminating at its lower extremity with a flange or disk, which rests upon the surface of the cement test-piece. The tube is provided with a set screw at one side, and in it slides a rod into the lower end of which the steel needle is inserted. The length of the needle is 1.181 inch (0.03 metre), and its sectional area 0.0015 square inch (1 square millimetre), the upper end of the rod is provided with a small flange or platform, upon which the required number of zinc disks, each weighing 1.76 oz. (50 grams), can be placed. The rod itself weighs 50 grams. In one side of the rod, opposite the set screw, is a notch, the upper surface of which forms an inclined plane. Against this inclined plane the end of the screw rests, and by turning the screw the needle may be gradually lowered upon the surface of the test-piece. The upper part of the rod is furnished with a scale, upon which the depth to which the needle has penetrated may be read off.

Tables are given showing the difference in the progress of setting of various products.

WESTERN ASSOCIATION OF ARCHITECTS.

J. F. ALEXANDER, Secretary of the Western Association of Architects, Lafayette, Ind., has issued a circular calling the attention of the members of the association to a resolution adopted at the last convention, instructing the Board of Directors to drop from the rolls of the association all those whose practice is not in accordance with its by-laws. He has also issued a list of the members, with the request that such information be sent to the Board of Directors as will enable them to follow the association's order by excluding from the rolls any persons whose practice conflicts with the qualifications specified in the by-laws of the association. Announcement was also made that the names of applicants for membership should be sent to the Board of Directors on or before September 24, 1887.

* By H. Bonnami, taken from *La Nature*.
Proceedings of the Institution of Civil Engineers.

SANITARY WORK IN WISCONSIN.

THE State Board of Health of Wisconsin, in its annual report for 1886, declares its belief with regard to cholera that "wholly as a result of the effort made to prevent it from doing so, it has not yet appeared in any part of the United States." This is a doctrine to which we cannot subscribe, for we think that good luck has had more to do with the result than good conduct, but it must be admitted that the report of the Secretary of the Board, Dr. J. T. Reeve, is a very satisfactory one as indicating progress in sanitary education and work throughout the State. The law requires that every town, city, and village in the State shall organize a health board annually, which would require the organization of about 1,100 such boards in the State. Actually 930 such boards are reported, and many of these appear to have been busy in dealing with questions of nuisance, of the spread of contagious disease, of the proper relations between wells and privy-vaults, etc. Dr. Reeve states that "in very few instances has any special fund been appropriated for the use of the local Board of Health, but in very many the report is made that any expenditures authorized by that board have been promptly met from the general fund of the town."

The State as a whole was unusually healthy during the year. Small-pox appeared in a few localities, but was promptly and efficiently dealt with and readily stamped out. Typhoid fever was less prevalent than in former years, and the same may be said of all the forms of epidemic disease, except that diarrhoeal diseases have been frequent almost everywhere.

Following the Secretary's report are several papers of interest. The first is by Professor Erastus G. Smith, of Beloit College, on the results of investigation of some bright-colored candies. The most dangerous substance found was chrome yellow—i. e., chromate of lead. The second gives the result of an investigation of an epidemic of typhoid fever at Waterford, which appears to have been due to the contamination of a well. Other papers relate to sewerage, to school sanitation, to heredity, etc., the whole forming a volume of 250 pages which is highly creditable to the board.

MEDICAL CONGRESS.

THE programme for the International Medical Congress, which will meet in Washington next month, is about finished. It is now as follows:

Monday, September 5, General Meeting at Albaugh's Opera House, beginning at 11 A. M.—Organization of the Congress, report of Secretary-General, report of chairman of Local Committee. Address of welcome by Secretary of State Bayard. Address by the President of the Congress and other addresses. Afternoon session, beginning at 3 P. M. Evening conversazione, at Pension Hall, from 8 to 11 P. M.

Tuesday, September 6.—General address. First, Dr. Austin Flint, of New York, on "Fever, its Causes, Mechanism, and Rational Treatment;" second, Dr. Mariano Semmola, of Naples, Italy, on "Bacteriology and its Therapeutical Relations." Programme for all sections: Morning session, 11 A. M., adjourn at 1 P. M. Afternoon session, 3 to 6. Visit to Corcoran Art Gallery.

Wednesday, September 7.—General addresses. First, Dr. P. G. Unna, of Hamburg, Germany, on "The Relations of Dermatology to General Medicine;" second, Dr. G. Fielding Blanford, of London, on "The Treatment of Recent Cases of Insanity in Asylums and in Private Houses." Sections same as Tuesday, reception by citizens.

Thursday, September 8, General Meeting.—General addresses. First, Dr. A. Luteaud, of Paris, on the "Influence of Discoveries of American Surgeons on the Development of Gynecology in Europe;" second, Dr. Neudorfer, of Vienna, on the "Military Medicine of the Present and That of the Near Future." Section meeting as on Tuesday evening; general reception and buffet banquet at Pension Hall.

Friday, September 9, General Meeting at 10 A. M.—For general business. Sections. Morning session at 11 A. M., afternoon session at 3 P. M.

Saturday, General Meeting at 10 A. M.—Visit to Mt. Vernon.

THE Philadelphia Board of Health has passed a resolution requesting architects to present separate plans of the drainage system of the buildings they may hereafter design.

KITCHEN BOILER IN THE NEW YORK DIOCESAN HOUSE.

WE illustrate this week the setting of the kitchen boiler in Bishop H. C. Potter's new "Diocesan House," 29 Lafayette Place, New York City.

The features of the work are its symmetry and compactness, together with the use of two circulation pipes, one for the supply to fixtures in the front of the building and the other for those at the rear. The skeleton diagram ex-

plains itself, with the exception of the "plug," which is made of a solid piece of metal, and inserted merely for symmetry. The sediment pipe discharges over a sink in the cellar.

The boiler is of heavy copper, with a capacity of 80 gallons, and the pipes galvanized iron.

The work was done by Mr. Charles Tucker, master plumber, 45 East Eleventh Street, from plans and specifications prepared by Frederick N. Owen, C. E., 13 William Street.

THE APPRENTICESHIP QUESTION.

THAT the apprenticeship question is one that the public appreciate as a live one is evidenced by the following editorial in a recent issue of the *New York Times*. Moreover, the consideration of such problems by plumbers' associations will do much to impress the public with the fact that there are thinking, public-spirited men in that craft deserving of something better than being the object of the newspaper funny man's too often labored efforts. The *Times* says:

"It is a promising sign that so much time was given at the National Convention of the Master Plumbers at Chicago and of the Master Painters in this city to considering the best methods of training apprentices. All over the United States the master mechanics are beginning to realize that it is their duty not only to keep up the standard of workmanship, but to see that the foreign workmen who do so much of the skilled work of this country do not exclude American young men from the trades by selfish union rules against their instruction. The patriarchal system of binding a lad to a master, who in return

for his services was not only to teach him a trade, but to receive him into his family, has long since disappeared.

"The master mechanic does not now work with his men, and cannot give much attention to his apprentices. There are also few respectable parents who would be willing to place their sons beyond their control, and there are few conscientious employers who would care to incur the responsibility implied in the old apprentice laws. The desire, however, on the part of the master mechanics to control in some way the labor of the lads they receive in their employ still remains, and this point was kept clearly in view in the discussions at the two conventions referred to. The difficulty of retaining a lad's services for a specified number of years lies in his unwillingness to work during the latter part of his term at low wages in consideration of past benefits, or even to admit that he has received anything more than he has already paid for by his labor. The attempt to force the young mechanic to work for less than he can get in the open market usually results in his abrupt departure, and perhaps, after repeated experience of this kind, in the master mechanic concluding that the young men of the present day are a shiftless lot.

London, Eng., designed to afford a method of drain testing which shall dispense with the necessity of a machine.

ACTUAL SIZE OF DRAIN GRENADE

This "Drain Grenade," or "Drain Ferret," consists of a cylindrical vessel, made either of gelatine or thin glass, about $2\frac{1}{2}$ inches long by $\frac{3}{8}$ of an inch diameter. It is charged with either peppermint, asafetida, or a special pungent compound. The "grenade" is thrown down the drain to be tested, due care being taken in the case of the glass one that it shall have sufficient fall to break, whereby the contents is, of course, released. In the case of the gelatine "grenade" the filling is, of course, released as soon as the gelatine is dissolved. A little hot water is thrown down the drain after the "grenade" in order to flush it through.

CUT-OFF VALVE FOR FLUID-SUPPLY PIPES.

THE accompanying illustrations, Figs. 1 and 2, show a new cut-off valve for pressure-supply pipes, lately invented and patented by Mr. Frank Moore, of Pittsburg, Pa.

The principal object of this class of valves is to automatically shut off the flow of natural-gas from a house or building should the pressure become so low in the mains as to allow the burner or lights to become extinguished.

Serious accidents and loss of life occurred in and around Pittsburg, when the natural-gas was first introduced, by interruptions to the pressure—caused by the shutting of the mains to make connections, etc. This caused the lights within the buildings to go out, and, in many instances, the gas was let on again with no one to attend to opened fixtures, the escape from which, being almost odorless, filled the rooms, causing poisoning or explosions. The present invention is to shut off the house service-pipe

Fig. 2.

Fig. 1.

under such conditions, and keep it closed until opened with proper care, and after the burners within the house have been closed.

To accomplish this, the apparatus is introduced into the service-pipe, the street-pressure entering the inlet and forcing the valve V to its seat both by pressure on the back of the disk and by the pressure exerted by means of the upper diaphragm D, the street-pressure of the gas passing through the passage P to the top of the diaphragm and communicating its motion through the bell-crank and stem as shown. This is the position of the apparatus should the lights be put out in the house by an interruption of pressure or should a large pipe be broken, or should anything

that will reduce the pressure below some fixed

To open the valve so the regular flow of gas to the house, a small valve within the

"The fault, however, would seem to be not so much with the young men as with a system which seeks to lump the clever with the dull and the handy with the awkward, to require all to work for four or five years and then consider that they are skilled workmen. In such a system the more carefully a lad is trained in the workshop, or, as it is now proposed, in both the workshop and the trade-school, the greater the difficulty will be of retaining his services as he approaches manhood. If rules are devised to keep him, his young brain will devise some means to circumvent them. The interest the master mechanics are now taking in this apprentice question is a long step in the right direction. It concerns so deeply the welfare of many thousands of young men that it is important in any scheme to avoid as far as possible anything which may tend to discourage the masters or create a feeling of injustice among the apprentices. It might be possible to find some test of what constitutes a skilled workman besides the number of years passed in learning a trade. The main point would seem to be how much the apprentice knows when old enough to do a full day's work, not how long he was in acquiring his skill."

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

DRAIN TESTING.

THE illustration shows a new appliance, introduced by the Banner Sanitation Co., at Northumberland Ave

cap C is withdrawn by hand, allowing the high or street pressure to pass into the house-pipes by this by-pass, which is simply a direct communication between the inlet and outlet of the "cut-off" valve. This allows the pressure on the house side to increase until it acts on the under side of the diaphragm D', which is two or three times the area of D, pushing the latter up and holding the valve V open against the pressure and flow of the gas. As long as the pressure on the larger of the differential diaphragms is able to overcome the smaller one the valve will remain open. To natural-gas engineers the use of the apparatus is obvious.

WAGES IN GREAT BRITAIN.

THE *Engineer*, for May 27, in an article on "Wages in Great Britain," quotes the following as the ruling prices for some branches of trade in the localities named:

Wages Paid per Week of Fifty-four Hours in Derby—General Trades.

Established artificers in the Royal Dockyards have regular and uninterrupted work throughout the year, are employed eight hours a day, chiefly under cover, have holidays for which no deduction of pay is made, medical attendance, half pay when hurt at duty, superannuation after ten years' employment, promotion to the highest class of officers in their respective trades, and pensions are granted to widows of men killed in the service. Hired men do not enjoy promotion, superannuation, their widows are not entitled to pensions, and some of the men are liable to be discharged on the completion of certain work. The average rent paid by the better class of workmen in Plymouth is 2s. per week for one room, and 3s. 6d. per week for two rooms; laborers paying less, and getting worse accommodation. There are several blocks of artisans' dwellings at about the above rates, and also at 1s. 6d. and 2s. 6d. for one and two rooms, respectively, with very fair accommodation. Large numbers of dockyard workmen and skilled artisans have small houses of their own, which they pay for in the shape of purchase money and rent. Coal is 16s. and 17s. per ton, gas 1s. 11d. per 1,000 cubic feet.

Rent paid by laborers in Exeter is from £6 to £8 per year; by mechanics, from £8 to £10 per year. The lowest rent of a single room, about 10 feet square by 7½ feet high, is 1s. 6d. per week. The Industrial Dwellings House Company have 82 tenements let at from 2s. 6d. to

4s. 6d. per week, and a few of a superior class let at 5s. 6d. per week. A great many more houses have been built than what have been pulled down, and there is every year an increasing number of small houses, ranging in value from £12 to £14. Coal is from 16s. to 18s. per ton, and gas 3s. 6d. per 1,000 cubic feet.

E. G. LOVE, Ph.D., *Gas Examiner.*

NATIONAL ELECTRIC ASSOCIATION.

THE National Electric-Light Association met in Boston August 9. The opening address, by President J. F. Morrison, of Baltimore, rehearsed the improvements in incandescent lights, storage-batteries, and motors that had taken place since the last meeting, and advocated legislation to further promote the advantage of the uses of electricity. Mayor O'Brien delivered the address of welcome to the city. He hoped the association would show Boston how to better light her streets and dwellings. Mr. Arthur Stearns read the report of the Committee on Patent Legislation. It dwelt on unity of action in the Patent Office by the establishment of a commission or court within the department. The committee submitted a bill to be presented to the next Congress to carry the idea into practice. They have delegated the several members to use their influence with Congressmen, and recommend that the next meeting be held in Washington when Congress is in session. Mr. A. V. Garratt made the report of the Committee on Wire Gauge, giving the results of the formula of several mathematicians. The report of the Committee on Proper Insulation of Wires and Proper Installation and Construction of Plant was read. It expressed the opinion that a theoretical discussion of the subject would be of little value to those engaged in practical electrical work. They had therefore instituted practical tests by instruments of currents. They asked for means to pursue such tests, and suggested the issue of directions to companies which would secure the making of uniform tests on resistance, insulation, conduction, etc. The convention made an excursion to Lynn and other points.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

SIZE OF SAFETY-VALVES FOR STEAM-BOILERS.

NEW YORK, July 10, 1887.

SIR: (1) Will you kindly inform of a constant reader of your valuable journal the proper proportion of safety-valves to use on boilers and how to calculate them, say for a 100-horse-power boiler? (2) Whose safety-valves do you consider the best? Yours truly, B. W.

[(1) You do not state the class of safety-valve you desire to use nor the service they are for. Regulation 24 of the General Rules and Regulations of the Board of Supervising Inspectors of Steam Vessels (Section 4,418, Revised Statutes) says: "Lever safety-valves to be attached to marine boilers shall have an area of not less than one square to two square feet of the grate-surface of the boiler, and the seats of all such valves shall have an angle of inclination of forty-five degrees to the centre line of the axis. * * * Any spring-loaded safety-valve constructed so as to give an increased lift by the operation of steam, after being raised from its seat, or any spring-loaded safety-valve in any manner, or so as to give an effective area to that of the afore-mentioned spring-loaded safety-valve, may be used in lieu of the common lever-weighted valve in all boilers of steam vessels, and all such spring-loaded safety-valves shall be required to have an area of not less than one square inch to three square feet of grate-surface of the boiler. * * * But in no case shall any spring-loaded safety-valve be used * * * without first having been approved by the Board of Supervising Inspectors." These rules, you will see, are not directly proportional to the horse-power, but to the grate area.

We know of no true method of finding the area of a safety-valve by calculation. The common safety-valve, when set one square inch of area to two square feet of grate, will not relieve a boiler if the fires are in full force and all other means of drawing steam from the boiler closed.

Many of the pop safety-valves, so called, with differential seats and spring-loaded, on the other hand, are capable of relieving the boiler of all steam made, although they are only one square inch to three square feet of grate. This is because the escaping steam acts on a much greater area of disk after it begins to escape than it did before, forcing it further from its seat and getting greater passage for the escape of steam. These valves always open and close suddenly for this reason.

(2) We do not know who makes the best safety-valve, but the use of the following valves is allowed by the U. S. Board of Inspectors:

OPEN SAFETY-VALVES.

Common lever-valve.

Herreshoff Manufacturing Company, pop safety-valve.

LOCK-UP SAFETY-VALVES.

H. G. Ashton, East Cambridge, Mass.

Case & Baillie, Detroit, Mich.

J. D. Lynde, Philadelphia, Pa.

Richardson & Co., Troy, N. Y.

Dry-Dock Engine-Works, Detroit, Mich.

Cockburn's safety-valve.

Ashcroft's safety-valve.

Crosby's safety-valve.

McCrse's safety-valve.

Hodgin's safety-valve.

A. Orme's safety-valve.

W. E. Pierson, pop-valve.

George E. Collyer, safety-valve.

R. F. Silliman's safety-valve.

Consolidated Safety-Valve Company, Bridgeport, Conn., steam and vacuum gauge.]

A KITCHEN-BOILER QUESTION.

GALT, ONT., July 20, 1887.

SIR: I inclose a drawing of a kitchen-boiler, and I want to know if the exhaust-pipe will keep the water in the tank from freezing if the fire is kept burning all night, which must be done anyway to prevent any danger of an explosion. I also wish to know if the pipes in drawing are put up right. The pipe is $\frac{3}{4}$ -inch all through, but supply-pipe from pumps, which is $1\frac{1}{4}$ -inch. I also want to know if I should do away with the exhaust-pipe in the kitchen-boiler drawing. Please give me a reply early as possible and oblige, yours truly, C. FITZGERALD.

P. S.—Is it proper to connect a bath-waste with a water-closet trap and not use a bath-trap, or to connect it beyond the seal and put a trap under bath—all traps ventilated?

[The pipe which you call an exhaust-pipe, which is in reality a vent and expansion-pipe from the hot-water system, will not keep the tank from freezing. The pipes in the drawing are well enough arranged, except, perhaps, it would be better to have the vent-pipe taken from the bath branch higher up instead of from the horizontal pipe. If it so happens there is a long distance between them, then leave it as it is.]

The bath should have a separate trap and the pipe from it should enter the soil-pipe and not the water-closet trap or pipe.]

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

THE association was called to order Wednesday morning in the library of Columbia College in New York by ex-President E. S. Morse, of Salem, Mass. Bishop Potter made a brief prayer and then retiring President Barnard, of Columbia College, made the address of welcome in a cordial and touching spirit. Professor Langley, President of the Association, replied, and then the work of the sections began.

Professor J. R. Easton was elected Vice-President of Section A (Astronomy and Mathematics). In Section B Vice President W. A. Anthony read an address on the "Importance to the Advancement of Physical Science of the Teaching of Physics in the Public Schools." Professor Anthony advocated the teaching of physical science in the schools as an important factor in directing the minds of men who would be engaged in various pursuits to the value of scientific truths, and securing their co-operation to a greater degree with the student of pure science. In Section H (Anthropology) Vice-President Brenton gave the address on a "Review of the Data for the Prehistoric Chronology of America." In Section F (Biology) Vice-President Farlow discussed "Vegetable Parasites and Evolution." He concluded that it was "highly probable that vegetable parasites originated at an early epoch from non-parasitic forms."

In section I (Economic Science and Statistics) Vice-President Alvord gave the sectional address on "Economy in the Management of the Soil." For food, clothing and shelter, he said, we are dependent directly or indirectly on the soil. The rapidly increasing demands of our own country are met and more than met, so far as mere quantity is concerned, for a great surplus is annually sent abroad. For twenty years agricultural products have constituted three-quarters of all the exports from the United States. And it is manifest that this superabundance of soil products will continue despite all possible increase in population at least well into the next century. But the wisdom and economy of our present systems of production and disposition is a very different matter. A steady draft continues upon the important elements of fertility, with no adequate system of rest, tuition or recuperation for the soil. Every crop removed from the land diminishes its store of plant-food and this reduces its productive power. The three most important elements of plant-food are nitrogen, potash and phosphoric acid. The effect upon the soil depends upon the disposition of the products embodying these. Fortunately very large parts remain upon or are returned to the land; on the other hand there are vast losses from waste besides the portions sent to foreign lands. With our rapidly increasing population and a constantly lessening fertility of soil, we have presented to us questions of the gravest importance. By the wasteful processes prevailing, we are expending our very substance and daily adding to a burden under which generations to come will stagger. These considerations should increase our regard for the business of farming and our interest in it. We should all rejoice at the revival of agricultural studies and the increasing number of able men who are making them their life's work. Let me cordially invite continued contributions to the proceedings of this section—upon foods, fabrics, forestry, industrial education and other topics closely related to our material welfare.

In Section E (Geology and Geography), Vice-President Gilbert, in an address on "The Work of the International Congress of Geologists," described the movement toward a uniform nomenclature begun in Paris in 1878. The congress last met in 1885 at Berlin. The next meeting will be held in London in 1887. In Section C (Chemistry), Vice-President Prescott discussed the "Chemistry of Nitrogen as Disclosed in the Constitution of the Alkaloids." In the evening Professor Morse discussed "A Decade of Evolution" (in America during the last ten years). In Section D (Mechanical Science), Vice-President Cox gave the sectional address on "The Necessity of Scientific Training for Engineers." We reproduce the *Tribune's* abstract:

"An occasion like the present, when an engineer who is really a business man is called upon to preside over a scientific body, naturally gives him much food for reflection. Having no scientific specialty, he can only offer some thoughts that have occurred to him during the time he has been engaged in active work. Engineering, though the youngest of the professions, is already divided into civil, mining, mechanical, and other branches, but there is another kind of sub-division taking place. To some engineers it is a science, to some a profession, to some a business. The words "Engineer" and "Engineering" are derived from the Latin *signo*—to bring forth, to produce—they involve the idea of progress or evolution, not of creation. This may be called the age of engineering, as it is called the age of progress. The engineer is deeply indebted to those scientists who during the past hundred years have been determining, experimentally, the data which are indispensable to him and to that other class who have compiled and discussed mathematically the data thus obtained.

Many of these men have done their work, which was often appreciated by a select few only, at their own expense and at a great sacrifice to themselves. They are among the noblest and bravest of the soldiers of science. The first practical engineers were developed in the field or in the workshop. They had generally little preparatory or scientific training, and learned what they could while engaged in the active duties of their profession. Their great success is thought by some to show the uselessness of scientific training for the engineer. This is a great error. They became what they did in spite of, not because of, their want of scientific training. "But there were giants in those days." But the importance of such study is shown by the large number of technical colleges of high reputation in the United States. Engineers of the present day may be divided into three classes. First, that of the scientific engineer. This includes professors, experimenters, compilers, and those now in charge of the physical and technical laboratories of the great railroads and industrial establishments. They are really men of science. Second, that of consulting engineer. This includes the engineers of railroads, mills, mines, etc., who design and superintend the technical part of the work of such establishments. They answer more nearly to the popular idea of an engineer.

"The third class, now becoming a most important one, includes the business engineer—that is, men who will engage to build a bridge or do any other engineering work, furnishing plans, etc., and guaranteeing to accomplish certain required results for a given sum of money, taking all risks. At the present time one of the most important, vigorous, and interesting discussions engaging the attention of the engineering world is that of technical education, upon which there is a great divergence of opinion as to the proper relation of theory and practice in the training of the students of engineering. Men of great ability and experience differ widely upon this subject. In law, theology and medicine there is practically a system of study agreed upon, although there is not of course unanimity as to details. But in engineering this is not the case; some consider that the young man who does not go to college, but grows up in an industrial establishment or in a railroad corps will advance better than one who goes to a technical school; others maintain that if a man is well grounded in theory he can pick up his practical knowledge anywhere. These are the extremes, but between them there are a great variety of views, all held by men of ability and experience. If a number of lawyers, doctors, and clergymen were to try to lay out a single course for every student who desires to enter either of the three professions, they would find it difficult to agree, and if they did the course suggested would be bad for every one, though some of those who followed it would gain a good position in their profession on account of their special mental capacity. May we not be unconsciously endeavoring to frame such a course for students of engineering to follow, which in consequence of the broad field from almost pure science to pure business, now covered by that profession, it is impossible for any student, in the short time at his disposal, to go through except in a most superficial way? May it not be necessary for the student to decide earlier in his college life whether he is going to be a man of science or a man of business, and then to devote more time to those studies specially required for the career he intends to embrace? By doing this may he not only be prevented from wasting much of his valuable time, but also avoid superficial study which is so bad for a young mind? The highest duty of the engineer is to save waste. If the man who makes two blades of grass grow where one grew before deserves well of mankind, how much more he who prevents the useless labor of sowing seeds that may grow up into worse than useless weeds. I hope you will deem this question worthy of your thought, interested as I know so many of you are in the subject of technical education."

The Sections and papers are as follows:

Section A (Astronomy)—Professors Wilson, Princeton, and Bigelow, Racine College, Wis.; Mr. Kershner, Lancaster, Va.; Dr. Van der Weyde, New York, three papers; J. A. Brashear, Allegheny, Pa., three papers; Professor Macfarlane, University of Texas.

Section B (Physics)—Professor Davis, Harvard; W. F. Magic, Princeton; A. B. Johnson, of the United States Lighthouse Board; Messrs. Michelson and Morley, Cleveland; Professor Rogers, Bowdoin University, Maine, nine papers; Dr. P. H. Van der Weyde, New York, two papers; Professor Macfarlane, University of Texas; Professor Skinner, Massachusetts Institute of Technology; Dr. W. Thompson, Jefferson Medical College; F. P. Dewey, Smithsonian Institution; C. F. de Landero, Guadalajara, Mexico, and Elias E. Ries, New York; G. H. Williams, of Syracuse.

Section C (Chemistry)—Miss Helen C. de S. Abbott, Philadelphia; Messrs. Power and Weimar, Madison, Wis.; Professor J. M. Norton, Massachusetts Institute of Technology; Professor E. Mason, Polytechnic Institute, Troy; Professor Morley, Cleveland; A. L. Green, Lafayette, Ind.; Professor Herrick, State College, Pa.

Section D (Mechanical Science)—Professor Thurston, Cornell, two papers; Professor Eddy, Cincinnati College, Ohio, two papers.

Section E (Geology and Geography)—Professor Richard Owen, New Harmony, Ind., two papers; Dr. Julien, Columbia; Professor Claypole, Akron, O., four papers; Professor James, Miami University, O., two papers; H. P. Cushing, Cleveland, O.; Professor H. S. Williams, Cornell; R. T. Hill, United States Geological Survey; Professor Orton, Ohio State University; C. Wolcott, United

States Geological Survey; Professor Scott, Princeton; G. H. Williams, Syracuse; the Rev. H. C. Hovey Bridgeport, Conn.; Professor Comstock, Champaign, Ill.; C. S. Prosser, Ithaca; I. E. Willett, Macon, Geo.

Section F (Biology)—Professor Mills, McGill University, Montreal; Dr. C. P. Hart, Wyoming, O.; Professor Scott, Princeton; Dr. Kost, University of Florida; R. P. Whitfield, American Museum of Natural History, New York; Dr. Britton, Columbia; Professor Wilder, Cornell; S. E. Warner, Newton, Mass.; Dr. Baur, New Haven, Conn., two papers; Professor Cope, Philadelphia; Dr. Rusby, New York.

Section G was united with the preceding section.

Section H (Anthropology)—Professor Mills, McGill University, Montreal; Dr. Hart, Wyoming, O.; Professor Kost, State Geologist of Florida; Miss F. C. Babbitt, Coldwater, Mich.; the Rev. W. M. Beauchamp, two papers; Dr. de Hass, two papers; Thomas Wilson, Washington; Professor E. H. Perkins, Burlington College, Vt., two papers; Professor Claypole, Professor Putnam, Harvard.

Section I (Economic Science and Statistics)—Professor Leeds, Stevens Institute, one paper.

On Friday the Sections were busy with their assigned subjects. The titles of papers of more especial interest to our readers were: In B, "A Method of Telephone Communication between Ships at Sea," by Professor L. I. Blake, of Terre Haute, by sound-producing apparatus attached to vessels and worked below the surface of the water, the ships having also apparatus for receiving and reproducing the sounds. "The Strength of Nicaraguan Woods," by Professor R. H. Thurston, of Sibley College, Cornell University. The conclusion reached is that there exists in Central American forests an enormous store of timber of remarkably fine quality, and that we may find after a few years, when our own forests have been so denuded as to make it necessary to look elsewhere, a most important safeguard against that timber famine which seems to hang over our heads. "The American System of Water Purification," Professor Albert R. Leeds, of the Stevens Institute, of Technology. "The Geology of New York City," by Professor D. S. Martin, Section —. "The Economy of Food," by Professor W. O. Atwater, of the University of Michigan, Section I, and "The Food of Workingmen and its Relation to the Work Done," by the same author. Friday evening there was a reception to the delegates at the Metropolitan Opera House, and Saturday a water party with a sail around the Upper Bay, given by Mrs. J. S. T. Stranahan, of Brooklyn.

The meetings will be continued through August 16.

MR. BELL AND MR. FRERET IN THE OFFICE OF SUPERVISING ARCHITECT.

THE following extracts from a letter by a Washington correspondent to the Milwaukee *Journal* are of interest:

"The sudden shift made in the office of Supervising Architect, by which Mr. Bell, who was appointed by President Arthur in 1883, goes out and Mr. William A. Freret, of New Orleans, goes in, caused quite a stir. This office is one of peculiar importance and its incumbent has an influence that extends over the whole country. A poor architect in this place may stud the land with permanent monuments of unsightliness, while one of skill and artistic capacity may do untold benefit. Mr. Bell will rank as one of the latter class. He has, in the four years of his incumbency, wrought a marvelous change in the general character of the public buildings erected by the general Government. His designs are rational, artistic, and permanently pleasing. Mr. Freret, who succeeds him, is also by reputation a man who has made the world more beautiful by his art. He is a native of Louisiana, born in New Orleans, and now in his fifty-fourth year.

"He graduated at the University of Virginia in 1849, and then perfected himself in engineering and architecture by studying abroad for several years. Thirty years before the war his father was Mayor of New Orleans, and the family has always enjoyed a high social standing. When the war broke out Freret entered the Confederate service promptly and soon attained the rank of Major of Engineers, serving under Kirby Smith. Many buildings in New Orleans attest his genius in his profession. The New Orleans Savings Bank building, designed by him twenty years ago, proved his skill. Most of the iron fronts on famous Canal Street are his work. The magnificent block known as the Moresque Building on Camp Street and Lafayette Square was his conception, intended to be purely Moorish in scope and details. It is beyond all doubt the most successful copy from the Moorish ever attempted in America. Over half the prominent churches in New Orleans were designed by Major Freret, and some are masterpieces.

"As Supervising Architect, Major Freret will have the opportunity Mr. Bell so well used, to improve the character of Federal buildings everywhere. Congress gives something like ten million dollars every year to the erec-

tion of buildings to accommodate customs, judicial, and postal officials. With such a vast sum running through his hands, the Supervising Architect is under a great burden of responsibility. Mr. Bell has given special attention to designing tasteful buildings for Southern cities. The South has, by the war and the backward condition of business in her various cities, hardly justified the expenditure necessary to provide good Federal buildings."

PERSONAL.

JOHN N. RISDON, founder of the Risdon Iron-Works of San Francisco, died at Oakland, Cal., July 31.

MESSRS. J. T. FANNING and H. H. Harrison have been appointed consulting engineers to the Water Board of Minneapolis.

ASSISTANT ENGINEER ALBERT W. STAHL and Ensign George W. Street, U. S. N., will be sent to Europe to study the construction of ships of war.

THOMAS J. WHITMAN, of St. Louis, will visit Milwaukee to consult with City Engineer G. H. Benzenberg, of Milwaukee, about a plan for the intercepting sewers.

ANDREW R. TREW, resident engineer of the New York Central Railroad at Tonawanda, N. Y., died suddenly August 11, aged 62 years. Mr. Trew had charge of the construction of the bridge at Niagara Falls.

HORACE ABBOTT, founder of the Abbott Iron-Works, Baltimore, died in that city on August 8, aged eighty-one years. Mr. Abbott was born in Massachusetts, and was related, on his mother's side, to Eli Whitney, inventor of the cotton-gin. In 1846 he moved to Baltimore and began the manufacture of shafts, cranks, and other iron-work for steam-vessels. He retired from active business some years ago.

CHIEF ENGINEER GEORGE W. MELVILLE, U. S. N., has been appointed to the head of the Bureau of Steam Engineering of the Navy, succeeding Engineer in Chief Charles H. Loring, who has resigned. Mr. Melville, who is now in his 47th year, has gained a great reputation for daring, persistence and energy, by the manner in which his work in the Arctic region has been done. It is believed to be due to him in large measure that the unfortunate "Jeannette" crew were in part saved from the Lena Delta of Northern Siberia; and he has been honorably mentioned for his work in the rescue of the Greely's Lady Franklin Bay expedition. It is reported from Washington that he has also a high reputation for knowledge and skill in the technical part of his profession.

POOR'S DIRECTORY OF RAILWAY OFFICIALS.

A SUPPLEMENT to Poor's Manual of Railroads, second annual number, 1887, has just been issued, containing lists of the officers of all railways in North America, and of the leading organizations auxiliary to the railway system, lists of officers of the South American and British railways, etc. New York, 1887. Price, \$2.

The second annual number of this work is much enlarged over the first number, and presented in more convenient form. It is a surprisingly complete record of the officials, including engineers and master mechanics of steam railroads, of street and horse railroads, and even of lumbering and logging railroads. It contains also directories of the officers of companies manufacturing railway supplies, and alphabetical lists of railway contractors. To all who wish the addresses of railway men the book is invaluable.

MESSRS. OTIS BROTHERS & CO., of New York, have received an order to begin the construction of two hydraulic elevators for the new Eiffel Tower now in course of erection in Paris, which is to be 1,000 feet high, and is to be completed in time for the World's Exposition in Paris in 1889. Special designs were submitted by Otis Brothers & Co., in conjunction with English, French, and German elevator manufacturers. There will be six elevators, four running to a point five hundred feet above the ground and two running upward from that point.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

MESSRS. BRUCE & MORGAN, architects, of Atlanta, Geo., have been selected by the Board of Trustees as architects of the new A. & M. College at Auburn, Ala.

THE Committee on Buildings of the Board of Chosen Freeholders of Hudson County, N. J., invite architects to submit plans in competition for a Hall of Records. For the best plan a premium of \$300 will be given. The building is to be 50x75 feet, two stories high, and fire-proof. Plans should be submitted before September 15. John Kelly, Chairman of the Committee, Jersey City, will give further information.

LYNN, MASS.—Common Council has voted to ask certain local architects to submit plans for a high-school building. Site and building will cost about \$100,000.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 295-297-298-301.

WATER. SEWERAGE, ETC.

BELAIR, MD.—Our correspondent writes: "Contractor W. W. Taylor, who has constructed water-works and supplied towns with water, has prospected here, with a view to supplying this town, but I do not think that anything as yet has been determined upon."

CANISTEO, N. Y.—Our correspondent writes: "The job has been let for the water-works of this town, and work commenced on digging the reservoir, and will start laying pipe soon. The main pipe will be ten inches inside measure, and branch pipes from that down to six inches. Capacity of reservoir two million gallons, and is built on a hill on quite a rise of ground."

MARTIN'S FERRY, O.—Our correspondent writes: "We have a set of water-works in course of construction. The plant will be done about September 1. Pumping capacity is 1,250,000 gallons in 24 hours; reservoir capacity, 3,000,000 gallons; city's population, 7,000, with extensive manufactories."

MASSFELD, MASS.—At the district water meeting August 9 W. A. Copeland was chosen Moderator. The vote to see if the town would accept the charter granted by the Legislature a year ago to build water-works for fire and domestic purposes resulted in 149 in favor to 65 against, six votes over the necessary two-thirds.

FLUSHING, L. I.—The contract for a 2,000,000 gallon pumping-engine has been given by the Village Trustees to the George F. Blake Manufacturing Company at \$8,500.

NEW YORK.—Messrs. Charles Julien and Henry Cerrier, French civil engineers, are examining the water-supply of this city.

PENSACOLA, FLA.—Colonel George E. Waring, of Newport, R. I., will make plans for a system of sewerage here. He has made a preliminary survey.

YOUNGSTOWN, O.—wants three miles of cast-iron water-pipe. The Water-Works Trustees have found great difficulty in obtaining any.

ST. PAUL, MINN.—The Water Commissioners have advertised for twenty-five tons of 36-inch lead pipe, extra strong, and twenty-five tons of pig lead; bids to be opened August 15.

LITTLE ROCK, ARK.—Bids are advertised for about one mile of sewers in Sewer District No. 12. To be the Waring system. Fred. J. Rickson is City Engineer.

MINNEAPOLIS, MINN.—The Water Board is advertising for water-pipe and pig lead.

CLEVELAND, O.—The Board of Water-Works Trustees have ordered about 5,000 feet of water-pipe laid.

DUBUQUE, IOWA.—Dr. Greene, advisory physician to the Board of Health, recently addressed City Council, urging the importance of the early construction of a good sewerage system.

KUTZTOWN, PA.—It is proposed to organize a Borough Water Company and build works for this place. Examinations of sources of supply have been made.

CARTHAGE, N. Y.—The village has been looking into methods of obtaining a water-supply, and now has received a proposition from the Canastota Water Company to furnish water from Black River or Pleasant Lake; the town to take seven hydrants at \$60 per year each, and to pay \$60 per year for additional hydrants. No definite action has been taken.

ST. CLOUD, MINN.—The City Council, August 1, accepted an ordinance from Phelps & Sykes, of Minneapolis, as amended, and the city attorney was instructed to draw a contract for the sale of the water-works with those parties. Work on an extension will immediately begin, and several miles of mains will be laid within sixty days.

WOODLAND, CAL., has given up for the present the idea of constructing a sewerage system.

SAUGERTIES, N. Y.—Yesterday, August 12, the town voted on the question of the purchase of the works from the Private Water-Works Company. We have not yet learned the result.

MODESTO, CAL.—Articles of incorporation of the Modesto Town Improvement Company have been filed. The capital stock is \$83,880, divided into 4,194 shares. The directors are George W. Spencer, Charles Maze, Jr., J. S. Alexander, Charles Page, and Charles P. Eells. It is the purpose of the company to buy and sell water-rights and real estate in Stanislaus County.

MANKATO, MINN.—Council has decided to build a large reservoir for the water-works system. Five lots will be purchased on Agency Hill, and bids for the construction of the reservoir will be advertised for at once. The improvement, including about one-half mile of pipe, and laying, will cost \$10,000. The City Council advertises for bids for the purchase of \$15,000 park bonds and \$10,000 sewer bonds, both to be issued in sums of \$1,000, to run twenty years and draw five per cent. interest.

ORANGE, N. J.—The Hyatt Filter Company, on August 8, sent an estimate of the cost of filtering apparatus to the Common Council. They offer to sell the city four filters, with a capacity of 1,000,000 gallons per day, for \$3,000 each, which, with the necessary piping, connections, etc., would cost the city \$15,000. The proposal was filed.

DANVILLE, MASS.—New water-works are to be established here.

FREDERICK, MD.—An increase in the water-supply is contemplated.

MINONK, ILL.—\$10,000 has been appropriated for water-supply.

ALBANY, N. Y.—Proposals are ordered for the Beaver Creek sewer. It will be 8x9 feet, 4,000 feet long. Address Horace Andrews, City Engineer.

SOUTH FRAMINGHAM, MASS.—On August 3 a report was received from S. C. Heald, C. E., on the site of the town. He proposed pipe sewers with brick outfall sewer and irrigation, estimating the cost at \$140,000.

HARRISON, N. J., wants propositions for sewerage of the streets.

READING, PA.—The Committee on Sewers will recommend to Councils the filling and covering of the following water-courses: Oley Street from Seventh to Ninth, \$8,000; Washington, beginning at Second, thence to Court Street and the River, \$10,000; from Front and Spruce Streets to the Canal, \$1,500; Culvert from Spring Garden Street to the P. & R. Railroad, \$2,500; Nicolls Street from Spring to Oley, \$30,000.

WASHINGTON, KAN., wants works.

GREENLEAF, KAN., will have water-works.

WARE, MASS., will extend its water-works.

CIMARRON, KAN., has voted \$50,000 for water-works.

CENTREVILLE, IOWA., is sinking a \$10,000 well for water-supply.

HUNTINGDON, IND.—City Council is examining systems of water-supply. Address them at once.

LOWELL, MICH.—A water company with \$30,000 capital has been organized here.

SACRAMENTO, CAL.—The Committee of the Sacramento Improvement Association has reported recommending examinations for sites of wells for increased water-supply, and the association has voted the money needed to make the investigation. Address W. A. Briggs, Chairman of the Committee.

PORTSMOUTH, VA.—Newark, N. J., parties are considering the advisability of introducing water-works here.

RIVERSIDE, CAL., will have water-works, also gas-works.

ANAMOSA, IOWA., will have water from an artesian well.

NEW ROCHELLE, N. Y.—A strong movement has developed here for the early beginning of a sewerage system. Address President Banks about the matter. A special committee will soon be appointed.

LONG ISLAND CITY, N. Y.—The Water Board of Long Island City met August 8. On motion of Mayor Gleason it was decided to lay five miles of water mains in the Third Ward and the German Settlement. The improvement will cost about \$50,000.

MILWAUKEE.—James Foley, chief of the Fire Department, will purchase 3,000 feet of rubber hose and 2,000 feet of cotton "jacket" hose in the open market.

Water-mains will be laid in Randall Street, from Cold Spring Avenue to Chestnut Street; also in Lee Street, from Humboldt Avenue to Weil Street, in North Avenue from 18th to 19th streets.

Plans and estimates for the cost of a flushing tunnel, with the capacity of 300,000,000 gallons of water daily, the tunnel to enter the river below the dam, will be prepared by the City Engineer.

A plan for the extension of the North Menomonee Inter-cepting sewer north of the North Menomonee Canal, for the purpose of intercepting the sewers emptying into the Menomonee Valley from the north, has been prepared by the City Engineer.

LA MARS, IOWA.—Address M. A. Moore, Mayor, with proposals for constructing water-works under a franchise.

GREENSBORO, N. C., will receive bids until September 1 for the construction of water-works under franchise. Address Mayor R. R. King.

VAN WERT, O.—Plans are wanted for a sewerage system here.

WATERTOWN, N. Y., will receive bids for construction of water-works until August 20. See our Proposal Column.

ABERDEEN, DAK., is agitating the construction of sewers.

WHITEWATER, WIS.—Bids for the construction of water-works are wanted by H. S. Salesbury, City Clerk.

OLNEY, ILL.—Mayor James E. Wharf will receive bids at once for constructing water-works under franchise.

GAINESVILLE, FLA., City Council has received a proposition from W. A. Jeter, of Brunswick, Geo., for the building of water-works. No action has yet been taken. It is proposed to issue proposals for bids.

NASHVILLE, TENN.—At the opening of bids, August 9, for the construction of a reservoir for the water-works, the lowest was found to be that of Whitsitt & Adams, of Indianapolis, at \$330,921, the highest from a Nashville party, at \$741,180. The contract was awarded to Whitsitt & Adams.

EAST TAWAS, MICH.—Our correspondent writes: "The village voted to bond the place for \$25,000 for water-works. A plan has been decided on and bids will be received for construction of the water-works, which are to be completed this year."

TITUSVILLE, FLA.—The citizens have voted in favor of a water-works. Address Pritchard & Sweet.

FORT WAYNE, IND.—The Mayor, City Attorney, and City Civil Engineer have been appointed a committee by Council to confer with Messrs. Buss, Fleming & Simmons in regard to purchase by the city of certain water-properties; also to consider the question of water-supply in general, and the advisability of sinking wells as a possible source of supply.

MANKATO, MINN.—A large reservoir for water-works system will be built. The improvement, including one-half mile of pipe and laying, will cost about \$10,000. Williams & Hanlon will begin sewer work at once.

MINNEAPOLIS.—The Council Committee on Sewers decides favorably to building a sewer connection with the North Minneapolis sewer tunnel from Twenty-fourth Street and Lyndale Avenue, the principal object being to drain about 100 acres of low land.

WATERBURY, CONN.—It is reported that Mayor Boughton and City Engineer Weld, of this city, are considering the practicability of constructing a system of sewers through the Naugatuck Valley, from Winsted to the Sound. The proposition is to unite Waterbury, Winchester, Torrington, Ansonia, Derby, Birmingham, and other towns in the construction of a great intercepting sewer, relieving the Naugatuck River from the sewage pollution it now suffers from.

PANA, ILL.—On August 8, City Council authorized the Mayor to appoint a committee to obtain estimates on the cost of constructing water-works.

FRESNO, CAL., is agitating the question of sewerage, and estimates the cost at \$50,000.

KALAMAZOO, MICH.—The Committee on Fire and Water will advertise for proposals for sinking a well, connecting several wells, water-pipe, etc. Address Engineer Pierson.

LOS ANGELES, CAL.—The Barton Land and Water Company was incorporated August 5 to buy and sell land and water in the San Bernardino Valley; incorporators, W. P. McIntosh, C. K. Day, H. M. Barton, and others.

GAS. STEAM, BUILDINGS, ETC.

LE MARS, IOWA.—A company has been formed to bore for gas or oil, with capital stock of \$10,000. The contract has been let, and work on a 2,000-foot deep hole will be commenced inside of thirty days. The company have leased 3,000 acres of land in the vicinity of Le Mars.

AMSTERDAM, N. Y.—The lighting of the streets by electricity is agitated.

HALIFAX, N. S.—The bids recently received for lighting the city by electric-lights have been rejected and new proposals will be advertised for.

PHILADELPHIA.—The Steam-Heating Company was chartered August 8 at the State Department at Harrisburg, with a capital of \$400,000, divided into shares of \$100 each. Horace Pettit, of Jenkintown, is treasurer of the new company and owns 300 shares. The other shareholders, each of whom owns twenty shares, are: William L. Nevins, C. F. Henry, Thomas Stuart, Robert P. Field, of Philadelphia, and H. P. Gill, Woodbury, New Jersey. A central supply station will be built and mains laid at once.

FORT SCOTT, KAN.—A syndicate is sinking a gas-well on the Jake Hamlin farm. Glass works will be built.

ROCHESTER, PA.—The Heat, Light and Power Company has made a contract with the Baden Gas Company for a supply of natural-gas. P. Moran, of Pittsburgh, has the contract for laying the necessary pipe.

LAS VEGAS, N. M.—A natural-gas company has been organized here.

FARIBAULT, MINN.—Common Council has granted a ten-year exclusive franchise to the Thomson-Houston Electric Light Company of Boston.

RICHMOND, MICH.—A company has been organized to sink gas-wells. Work will be begun next week.

CANASTOTA, N. Y.—The election of August 5 on the question of raising \$2,000 for electric-lights in the streets resulted in a tie vote. Another election will be held.

WHITE PLAINS, N. Y.—The articles of incorporation of the People's Gas-Light Company, which will furnish illuminating gas to the citizens at \$1.50 per 1,000 feet, were filed in the County Clerk's office August 2. The company has been granted a franchise to lay mains. The directors are Charles W. Ball, President; Charles T. Brooks, and George Olney.

SALEM, O., will have the streets lighted with electricity.

MEADE CENTRE, KAN.—Incorporated is the Mead Centre Gas, Fuel and Water Company, by O. B. Hamilton and others; capital, \$50,000.

LOUISVILLE, KY.—The Fisherville Natural-Gas Company is incorporated by S. E. English and others.

ANDERSON, IND.—The Citizens' Gas Company has been incorporated by John L. Forkner and others; capital, \$50,000.

GREENVILLE, S. C.—A company will organize to introduce the Thomson-Houston electric-light for the streets. Asbury & Son are interested.

DRE MOINES, IOWA.—The Capital City Electric-Light Company and the Thomson-Houston Company of this place, have been asked to submit bids for at least 100 arc lights.

RALPHIGH, N. C.—See our Proposal Column for notice of the opening of bids for furnishing steam-heating apparatus for capitol, Supreme Court and library buildings.

STILLWATER, MINN.—A contract has been made with the Stillwater Electric-Light Company to light the streets with electricity.

ALBERT LEA, MINN.—A company has been formed to sink gas-wells here.

JAMESTOWN, DAK.—Proposals will be received until August 27 by the Trustees of the North Dakota Hospital for the Insane for steam-heating apparatus and water-supply. F. E. Jones, Secretary.

OWENSBORO, KY.—The Gas-Works are to be almost entirely reconstructed and enlarged, at a cost of about \$50,000. Address H. D. Fitch for further information.

DALLAS, TEX.—The Southern Electrical Construction and Supply Co. will put in a 650 incandescent light Westinghouse engine, and fifty arc lights immediately.

WACO, TEX.—The Southern Electrical Construction Supply Co., of Dallas, Tex., will erect a plant here.

MINNEAPOLIS.—The Council Committee on Gas have considered bids for furnishing gas and electric-lights for the next five years. The bid of the Minneapolis Gas Co. was \$12,144.54 for 777 lights. The Brush Electric Light Company's bid was \$180 per light for from 400 to 500; diminishing to 1,000 or more lights at \$140 each. The committee recommended that the Brush Co. be awarded 400 lights at \$150 per year for five years; that they shall cut down the electric mast to 150 feet and provide it with eight lights of 2,000-candle power each, and reduce the annual cost from \$4,000 to \$2,000.

RAILROADS. BRIDGES. CANALS.

COLUMBUS, MISS.—The Tombigbee Railroad Company will let the contract for the construction of the road in a few days. For information, address B. A. Vaughn immediately.

SMITHFIELD, ALA.—The Elyton Land Company has secured the right of way for the belt-line railroad.

HARRISBURG, PA.—City Council has closed the contract with the Barber Asphalt Company for paving Market Street. This matter has been for some time under discussion.

RAILROAD.—Contractor Ryan, of Philadelphia, has received the contract for building seven miles of railroad from Pleasantville to Brigantine Beach, N. J.

HOT SPRINGS, ARK., has voted right of way to the New Orleans, Natchez, and Fort Scott Railroad.

BOSTON.—Surveys for the Meigs Elevated Railroad have already begun between Bowdoin and Harvard Squares. The section will be about eight miles long. Construction will begin the middle of September.

SYRACUSE, N. Y.—A stock company, including Col. A. C. Chase, A. C. Belden, H. J. Maury, William A. Sweet and others will build a drive along Onondaga Lake. Howard Soule, Jr., C. E., has made surveys, and estimates the cost at \$25,000 to \$35,000.

COATESVILLE, PA.—The Pennsylvania Railroad will build a stone arch bridge over the Brandywine at this place.

FLUSHING, L. I.—On August 8 the franchise for the street railroad in College Point was sold to the Flushing and College Point Railroad Company.

TACOMA, CAL.—Nelson Bennett has the franchise for a street railroad here.

HARRISBURG, PA.—City Engineer Cowden has prepared an estimate of the cost of paving certain streets, making the cost to be about \$74,000 for Medina stone, and lesser prices for other stone, down to \$60,000 for asphalt.

ST. PAUL, MINN.—The contract for the uptown bridge has been awarded to C. L. Strobel at \$340,324. A legal contest is likely to result, as other bids are lower.

ALLEGHENY, PA.—The Allegheny Committee on Streets and Sewers has instructed the City Solicitor and City Engineer to see that the Pittsburgh, Fort Wayne and Chicago Railroad Company build a viaduct across their tracks on West Market Street. A resolution has been adopted instructing the City Controller to advertise for proposals for furnishing and placing 2,000 street signs.

YONKERS, N. Y.—Address Oliver O. Stahlnecker about a movement here for a railroad through the city.

SALT LAKE CITY, UTAH.—Edmund Wilkes and associates will ask for a franchise permitting the construction of an electric railroad.

HINDOSTAN, IND.—It is proposed to erect a \$40,000 bridge over White River at this place. Address the Commissioners of Martin County.

ST. PAUL.—The Board of Public Works has awarded the following contracts: Grading York Street, from Forest to Clark, and Sims, from Forest to Edgerton, to R. L. Schutte for \$10,675; paving alley in Park Place adjacent to Folsom & Murray for \$650; paving alley in block 27, Woodland Park, to Folsom & Murray for \$1,650.

The board has reported in favor of the following improvements: Slopes on Dale Street at \$200; grading Marion Street from Atwater to Maryland; Woodbridge, from Atwater to Maryland; Milford, from Rice to Gaultier, at \$8,694; grading State Street from levee to Isabel Street, at \$45,700; grading Brainerd Avenue from Arkwright to Edgerton Street, at \$2,800.

RAILROADS INCORPORATED.—Tellico R. R. Co., Knoxville, Tenn., by R. L. Bright, T. E. McCroskey, A. S. Thomas, J. L. Clift, and J. D. Bright. The company is organized "for the purpose of constructing a railroad from an available point on the State line between North Carolina and Tennessee, to the city of Nashville, or to the Cincinnati Southern Railroad at or near Emory Gap in said State."

Clinton and Big Valley Railroad Company, Knoxville, Tenn.

The Camak and Wadesboro Railroad Company, Camak, Geo. G. H. McMaster, J. M. Beatty, John Bratton, James Jones, William S. Hall, D. L. Glenn, W. N. Mason, T. W. Woodward, R. M. Huey, and W. W. Ketchum, incorporators.

Desha and Eureka Springs Railroad Company. The road will begin at Pendleton, Ark., on the Arkansas River, and run to Eureka Springs, a distance of 210 miles. The capital stock is \$3,150,000. Board of Directors: G. P. Banks, Boston, Mass.; E. E. Pratt, Manchester, Mass.; W. E. Stowe, Belmont, Mass.; H. M. Cross, Boston; James Murphy, W. B. Dutton, H. Waldon, J. M. Whitehead, and J. M. Barnard, of Desha County.

RAILROAD.—Articles of incorporation have been filed by the San Gabriel Valley, Cal., Rapid Transit Company. The purpose is to build a railroad, to be operated by steam or electric power, from Los Angeles to Monrovia. The estimated length is fifteen miles. The directors are J. de Barth Shorb and J. R. Dobbins, of San Gabriel; F. Q. Story, of Alhambra; W. N. Monroe, of Monrovia; J. J. Gosper and H. A. Unruh, of Los Angeles; and J. D. Gilchrist, of Pasadena. J. de Barth Shorb is president, H. A. Unruh secretary, and F. Q. Story treasurer. The capital stock is \$250,000, of which \$15,000 is subscribed.

RAILROADS.—Incorporated is the Missoula and Bitter Root Mountains Railroad, of Montana. Also the Salt Lake Valley and Eastern Railroad, of Utah.

DENVER, COL.—The Denver City Railroad Company will lay its line across the viaduct to Argo.

LOS ANGELES, CAL.—The Los Angeles Cable Railway Company are advertising for 50,000 cubic yards of broken stone and 10,000 iron yokes. W. R. Davis will be in charge of the work.

NEW BRITAIN, CONN.—A new bridge will be built at the Black Rock crossing of the New England Railroad.

HARTFORD, CONN.—D. H. Andrews, of the Boston Bridge Works, has the contract for building an iron bridge over the Connecticut for the New England Railroad Company. The estimated cost is about \$75,000.

RAILROAD.—The State Line and Indiana City Railway Company has been incorporated by J. I. Torrence, C. N. Towle, W. H. Gastlin, James S. Prentiss, and Thomas W. Johnston, with a capital stock of \$500,000, for the further improvement of East Chicago. It will run from the Indiana State line to Indiana City, a distance of about twenty-five miles, and will be used as a connecting link for several roads.

MILWAUKEE, WIS.—The Dummy line to Whitefish Bay has its time for completion of the road limited to June 1, 1888.

The West Side Railway will abandon horses and take up the cable project. W. Becker is now in the East to look up the matter.

CHICAGO.—The Mayor has approved the ordinance providing for the Jackson Street viaduct. The bridge, viaduct, and abutment are to be constructed upon plans and specifications agreed upon by the Mayor and the Chief Engineer of the railroad company. The payments for the cost and expense of the iron viaduct and abutment are to be made by the railroad company from time to time as the work progresses.

MAYPORT, FLA.—The Jacksonville and Mayport Railroad Company will build a standard-gauge road.

RAILROAD.—Articles of incorporation of the Chicago, St. Paul and Kansas Railroad have been filed in the office of the Secretary of State, Kansas City. The capital stock is \$15,000,000. The estimated length of the main line is 350 miles. Three branches are also to be constructed, two of them 100 miles long and one 250 miles long.

ALBANY, N. Y.—The Kinderhook, Valatie and Stuyvesant Railroad Company has been incorporated; capital stock, \$150,000. The directors are Charles D. Haines, Daniel D. Wylie, Samuel Shethar, William Frister, and John B. McGeorge, of New York City; Frank H. Skeele, of Brooklyn, and Benjamin F. Ingraham, of Elizabeth, N. J.

TOPEKA, KAN.—Incorporated are the Osawatimie Building and Loan Association, with a capital stock of \$100,000. Directors: A. H. Knapp, J. C. Chestnut, H. B. Smith, D. Breneman, and C. S. Bixby.

Marion Coal, Gas and Mining Company with a capital stock of \$10,000. Directors: John F. Carter, W. W. Case, W. A. Stamford, S. C. Orr, and Levi Billings.

POUGHKEEPSIE.—Incorporated is the Poughkeepsie, Hartford and New England Railroad Co. The new road will run from Poughkeepsie in a north-easterly direction through Hibernia, Stanfordsville, McIntyre, Stiss, Attlebury, and Pine Plains to a point near Silvernails Bridge, where it connects with the Hartford and Connecticut Western, now owned by the Philadelphia syndicate. It will be about twenty-eight miles in length and the capital stock of the company is \$285,000.

ALBANY, N. Y.—Articles of association of the New York and Long Island Railroad Company were filed July 30 with the Secretary of State. Capital stock \$100,000. The road is to run from a point near the line of Borden Avenue in Long Island City, distant about one mile from the East River; thence partly underground and partly in cutting to the East River; thence under the East River by means of a tunnel and under streets and lands in the city of New York to a connection with the New York Central and Hudson River Railroad at the corner of Ninth Avenue and Thirtieth Street, with a branch on the north to a connection with the New

York Central depot, and a branch on the south to connect with what is now known as the Hudson River tunnel in the vicinity of Washington Square, New York. The directors are as follows: Walter S. Murner, Thomas Rutter, Augustus C. Gurnee, Roy Stone, Malcolm W. Nevin, George R. Sheldon, Frank K. Hain, and Oliver W. White, all residents of New York, and Henry S. Kindekoper, Philadelphia; E. Platt Stratton, College Point; Robert Townsend, Oyster Bay.

RAILROAD.—The New York and Boston Rapid Transit Company has sixty men in four surveying parties at work in Massachusetts, Connecticut, and New York, and a direct line between Boston and New York will be located, ready for contracts, by August 30. Negotiations are complete for constructing the line. The Boston and Maine and Boston and Providence terminals will be used. Forty millions of bonds are authorized. The highest estimate of cost is \$37,000,000. The New York terminals at Fifty-ninth Street and Broadway require \$2,000,000, and the northern connections require \$2,000,000. The main line starts from the Lowell station, Boston, runs through Willimantic, New Haven, and Bridgeport, entering New York at High Bridge, going down the west side of Central Park.

TUSCALOOSA, ALA.—The contract for grading the first ten miles of the Tuscaloosa Northern Railroad was let August 8 to Messrs. Robert Squire & Co., of Birmingham and Cincinnati. Work will begin in ten days after the contract is signed.

BIDS OPENED.

WHITE PLAINS, N. Y.—The following estimates were received by the Heating Committee of Westchester County Court-House and Jail, White Plains, N. Y. Plans and specification for the work were prepared by W. M. Mackey, Newark, N. J.

BIDDERS.	Amount of Estimate.	Total Radiating Surface.
Geo. B. Riggins	\$8,100	Not given.
Coulter McKenzie Machine Co.	7,445	4,850 sq. ft.
Baker, Smith & Co.	6,889	Not given.
The Denny Bros. Co.	6,640	5,230 sq. ft.
Jacob Jamer	6,430	4,300 "
Rutzler & Blake	4,993	3,350 "

The contract was awarded to Messrs. Rutzler & Blake, they agreeing to do the work according to plans and specification, and guaranteeing to heat the buildings to 70° Fah. in zero weather.

TOPEKA, KAN.—At the last meeting of Council bids for constructing about 13 miles of sewers, varying from 9 inches to 66 inches, were opened as follows: Messrs. Alexander & Nelson, of Kansas City, bid \$157,953.64, omitting an item of \$500. Mullens & Decker, of Kansas City, bid \$159,431.48; this firm omitted two items worth about \$1,100. Messrs. Ryan & Carrigan, of Kansas City, bid \$162,300.32. C. J. Rosen's bid was \$170,549.70. These were not satisfactory bids and new proposals have been issued.

MILWAUKEE, WIS.—For furnishing a heating apparatus for the new Tenth Ward School, Milwaukee, H. Moers & Co., bid \$3,500; M. Coogan, \$3,240. The contract was awarded to Coogan.

DETROIT, MICH.—Bids opened for Belle Isle Bridge: Detroit Bridge and Iron Works, \$280,000; Mt. Vernon Bridge Co., \$287,000; Milwaukee Bridge and Iron Works, \$287,000.

NEW YORK CITY.—Bids were opened at the Department of Docks on August 5 for granite work and masonry on the boat-landing wall and about the approach to Pier A, North River. The following were the bidders: Bernard Mahon, New York City, \$1,775; Joseph Mone, New York City, \$0,000; John J. Connors, New York City, \$9,600.

BOSTON.—The Sewer Department on Saturday last received proposals for building the following sewers: Everett Street—Ward 25—1,096 lin. ft. of earth excavation and refilling above grade in trench for 2' x 3' 3" brick sewer; 600 lin. ft. ditto for 2' x 3' 3" brick sewer; 381 lin. ft. ditto for 2' x 4' x 3' 6"; 484 cubic yds. of brick masonry; 405 cubic yds. of concrete masonry; 166 pipe connections.

Braintree Street—Ward 25—625 lin. ft. of 15" pipe sewer; 775 lin. ft. of 12" pipe sewer; 7 manholes. Lincoln Street—Ward 25—460 lin. ft. of 18" pipe sewer; 215 lin. ft. of 15" pipe sewer; 605 lin. ft. of 12" pipe sewer; 6 manholes.

Jamaica Street—Ward 23—821 lin. ft. of 12" pipe sewer; 783 lin. ft. of 10" pipe sewer; 11 manholes. Minot Street—Ward 24—600 lin. ft. of earth excavation and refilling above grade in trench for 1' 8" x 2' 6" brick sewer; 600 lin. ft. of 18" pipe sewer; 200 lin. ft. of 15" pipe sewer; 600 lin. ft. of 12" pipe sewer; 103 cubic yds. brick masonry; 39 cubic yds. concrete masonry; 48 pipe connections.

Harvard and Mayland Streets—Ward 20—96 lin. ft. of earth excavation and refilling above grade in trench for 1' 1" x 2' 6" brick sewer; 400 ditto for 1' 8" x 2' 6" brick sewer; 118 lin. ft. of 15" pipe sewer; 330 lin. ft. of 12" pipe sewer; 84 cubic yds. brick masonry; 37 cubic yds. concrete masonry; 40 pipe connections.

Brooks Street—Ward 1—812 lin. ft. of earth excavation and refilling above grade in trench for 3' 4" x 6" brick sewer; 108 lin. ft. ditto for 20' x 30' brick sewer; 37 lin. ft. 15" pipe sewer; 101 lin. ft. 12" pipe sewer; 228 cubic yds. brick masonry; 332 cubic yds. concrete masonry; 64 pipe connections.

For Everett Street: Patrick Grace bid \$12,367.50 and Collins & Ham, who received the contract, \$10,599.05. Charles F. Latimer was awarded the contract for Braintree Street, his bid being \$1,048.62 to \$1,784 by Patrick Grace. Mr. Latimer was also awarded Lincoln Street for \$1,011.75; the other bidder being Patrick Grace, \$1,090. For Jamaica Street: Collins & Ham received the contract for \$2,060.60; the other bid was \$2,080.50 from Hugh Nann & Co. For Minot Street the bids were: Collins & Ham, \$3,273.50; H. Nann & Son, \$3,494.05; John Morley, \$2,492.50; Dennis O'Connor, \$3,710.30; John O'Connor, \$2,793.65; the contract was awarded to Mr. Morley. The bids for Harvard and Wayland Streets were: Collins & Ham, \$1,256.85; H. Nann & Son, \$1,524; John Morley, \$1,106.23; John O'Connor, \$1,367.87; Solomon Sanborn, \$1,936.50. Mr. Morley got the contract. The only bid for Brooks Street was that of Solomon Sanborn for \$9,283.80 and it was rejected.

NEW YORK CITY.—The following bids were opened at the Department of Public Works August 9:

Cast-iron water-pipe, branch pipe and special castings—350 tons straight pipe, 50 tons branch pipe and special castings.

Bidders—Camden Iron Company, straight pipe, per ton, \$34.45, branch pipe and special castings, per ton, \$59.50; McNeal Pipe Foundry and Machine Company, straight pipe, per ton, \$32.25, branch pipe and special castings, per ton, \$60; Mellert Foundry and Machine Company (limited), straight pipe, per ton, \$32.60, branch pipe and castings, per ton, \$55.

For furnishing material and labor in the erection of a brick storehouse and workshop at the foot of Twenty-fourth Street, East River:

Bidders—A. Hurns, \$8,000; James Mone, \$7,700; S. Smyth, \$7,180.

For a sewer in Madison Avenue, between Ninety-fourth Street and One Hundred and Third Street, and also in One Hundredth Street.

Specification calls for 2,270 lin. feet brick sewer, 350 lin. feet pipe, 2,000 cubic yards rock excavation, and 2,000 feet B. M. timber.

Bidders: B. Mahon, total, \$36,170; J. P. Kerrigan, \$27,730; J. McKim & Son, \$23,834.10; J. W. Slattery, \$29,279.60; J. McQuade, \$27,395.

Sewer in Fourth Avenue, east side, between Ninety-sixth and One Hundred and Second Streets.

Specification calls for 1,530 lin. feet sewer, 1,000 cubic yards rock excavation, 5,000 feet B. M. timber.

Bidders: J. W. Slattery, total, \$13,065; J. W. McQuade, \$14,585; I. W. Smith, \$13,897.50; P. Rielley, \$13,883.50; J. McKim & Son, \$13,789.

CINCINNATI.—Proposals for bridges (1) Mill Run between Terrace Park and Milford; (2) over Muddy Creek:

(1) Queen City Bridge Works, \$2,740; Lomas Forge and Bridge Works, \$2,800.

(2) Queen City Bridge Works, \$1,420; Lomas Forge and Bridge Works, \$1,395.

BOSTON.—The City Architect's Department received proposals, August 10, for furnishing all materials for mason work on an engine-house in Liverett Street. The bids were as follows: S. Brennan & Co., \$11,901; R. R. Mayers & Co., \$0,325; Kenning & Strout Bros., \$9,880; Abraham Ripley, \$9,980.75. The contract was awarded to Mayers & Co.

The City Architect's Department on Wednesday opened proposals for a tower around the stand-pipe erected for the high main supply at Mt. Bellevue in the West Roxbury District. The bids were: R. R. Mayers & Co., \$14,000; and Donahue Bros., \$14,250. Both bids were rejected as being in excess of the estimated cost, and new plans and specifications will be prepared.

For furnishing a foundation for the Horace Mann School House in the West Roxbury District: R. R. Mayers & Co. bid \$11,525; D. H. Cram, \$10,990, and Kenning & Strout Bros., \$11,843. The contract was awarded to Mr. Cram.

ST. PAUL.—The contract for the erection of the new building of the New York Life Insurance Company has been let to Hennessy Bros., Agnew & Cox of this city. There will be ten stories, basement and sub-basement. The total cost will be about \$1,000,000.

The Court-House Commission have opened bids as follows:

For carpenter work: W. E. Barber, \$125,712; A. Bassford, \$127,926; Henry Maltby, \$132,900; Paul Haupt, \$135,500; Johnson Bros. & Loomis, \$174,744; Bohn Manufacturing Co., \$126,614.78; J. W. Mankinson, \$132,000; Corlies, Chapman & Drake, \$134,000. For steam-heating work: Allen Black, \$23,000; Kinny Bros., \$7,174 for boilers only; William Rogers & Co., \$24,424; A. E. Neipel, \$37,000; Charles Parmlee, \$27,497; Thomas Davis, \$27,445.96.

The contract was awarded to the Bohn Manufacturing Company of St. Paul for carpenter work. Haugh, Ketcham & Company offered three bids on extra dormers—\$3,166, \$8,137, \$9,961. Mathias Breen offered one bid on dormers, same work, \$12,644.

NEW LONDON, CONN.—The following bids for furnishing and laying about 4,350 lineal feet of pipe-sewers were received by the Board of Sewer Commissioners August 4:

Shaw & Whittlesey, Providence, R. I.: 17-inch pipe-sewer, Washington Street, \$1.30 per foot; 8-inch pipe-sewer, Starr Street, \$1 per foot; 8-inch pipe-sewer, Green Street, 75 cents; 15-inch pipe-sewer, Court Street, \$1.05 per foot; 12-inch pipe-sewer, Court Street, \$1.15; 15-inch pipe-sewer, Court Street, \$1.05 per foot; 12-inch pipe-sewer, Hempstead Street, \$1.40 per foot; 10-inch pipe-sewer, Jay Street, \$1.12 per foot; 8-inch pipe-sewer, Huntington Street, 93 cents per foot; manholes \$4 per vertical foot. Contract awarded.

M. S. Austin, New Britain, Conn.: \$1.80, \$1.40, \$1.60, \$1.45, \$1.45, \$1.45, \$1.78, \$1.55, \$1.68, \$1.60, \$5 respectively.

Connahan & Chapman, Norwich, Conn.: \$1.25, 85c., 90c., \$1.30, 90c., \$1.32, \$1, 80c., 95c, 70c., \$3.75; informal, rejected.

Prices fixed by board: rock, \$4 per yard; sheeting, \$15; foundation, \$25 per M feet; concrete, \$5 per yard.

[TOO LATE FOR CLASSIFICATION.]

PROPOSALS.

BUILDING RESERVOIR.—Laying water-pipe and furnishing miscellaneous supplies for the city of Altoona, Pa. Until August 20. These include constructing the Kittanning reservoir, laying 25,600 feet of water-pipe, and 25,000 of trenching. Address the Board of Water Commissioners, Thomas H. Wiggins, Chairman.

PIPE SEWER, 15 inches. Until August 16. Address Thomas McKiernan, Chairman of the Sewers and Highway Committee, Altoona, Pa.

SEWER WORK.—Extending Beaver Creek sewer, Albany, N. Y. Until September 19. Two sureties, each in \$30,000. Address the Board of Contract, Thomas J. Lanahan, Clerk.

GARBAGE FURNACE.—Proposals will be received until August 19 for erection of a garbage furnace in such locality in the city of Allegheny, Pa., as may hereafter be designated by the Committee on Health, to destroy not less than twenty tons of garbage, night-soil or butchery offal every twenty-four hours. James Brown, Comptroller.

PAVING and curbing South Street, North Des Moines, Iowa. Until Address W. A. Garrett, Town Recorder.

GOVERNMENT WORK.

BOSTON, MASS.—In his report to the Secretary of War, Colonel George L. Gillespie recommends the following appropriations for improvements in Boston harbor:

Extension of sea wall, George's Island \$10,000
Extension of sea wall, Gallipoli's Island 7,500
Extension of sea wall, Long Island 3,000
Sea walls, south and east bluffs Gov.'s Island . . . 80,000
Widening main ship channel at upper middle . . . 250,000
Completing Fort Point channel 60,000
Widening and deepening Nix's Mate channel . . . 25,000

CHARLESTON, S. C.—Colonel Q. A. Gillmore, U. S. Engineer, has presented his report to the Secretary of War on the improvement of Charleston and Savannah harbors. For Charleston he asks \$750,000 for next year; \$10,000 for Wappoo Cut, S. C.; \$20,000 for Edisto River, S. C., and \$8,000 for Salkehatchie River, S. C. He asks for \$780,000 for next year's expenditure in Savannah harbor, and recommends that this entire sum be made available in one appropriation. If this be done, he says an annual expenditure of \$20,000 will be sufficient to maintain the works. Of the projected improvements of the Savannah River, between Augusta and Savannah, General Gillmore says the original estimate of \$91,000 will have to be increased to \$176,000. This is due to the meagre appropriations in the past. He is confident that if the project be now carried out a channel of five feet depth at low water will be secured. He estimates that \$4,633 can be profitably expended next year in Romyer Marsh, Geo.; \$30,000 on the Altamaha River, Geo.; \$75,000 on Brunswick Harbor, Geo., and \$600,000 on the entrance to Cumberland Sound, Fla. Captain W. M. Black, U. S. Engineer, submits the following estimates for expenditures during the next fiscal year: Upper St. John's River, Fla., \$10,000; Key West, Fla., \$30,000; Caloosahatchie River, Fla., \$13,000; Manatee River, Fla., \$15,000; Tampa Bay, Fla., \$73,000; Withlacoochee River, Fla., \$20,000; Cedar Keys, Fla., \$15,000; Suwannee River, Fla., \$20,000.

MINNESOTA WATERWAYS.—Major C. J. Allen, U. S. Engineers, in charge of work on the Upper Mississippi and on the Red River of the North, in his report recommends the expenditure of \$210,000 on rolling dams at the Falls of St. Anthony, \$25,000 for the Chippewa River, \$101,000 for Minnesota River, and other sums amounting, in all, to \$7,000,000.

SYNOPSIS of bids for iron columns, beams, etc., for Post-Office, etc., building at Minneapolis, Minn., opened at the Office of Supervising Architect Treasury Department, August 11:

Clark, Raffan & Co., of Chicago, Ill., \$6,680; time to complete, 90 days.

Dearborn Foundry Co., of Chicago, Ill., \$7,500; four to five weeks.

SYNOPSIS of bids for steam-heating and ventilating apparatus for the Court-House, etc., building at Lynchburg, Va., opened at the office of Supervising Architect, Treasury Department, August 12:

Crook, Horner & Co., of Baltimore, Md., \$3,911.22; time to complete, 45 days.

Bartlett, Hayward & Co., of Baltimore, Md., \$3,988; time to complete, 3 months.

Pierce, Butler & Pierce, of Syracuse, N. Y., \$4,087; time to complete, December 1, 1887.

L. E. Miller, of Salem, Mass., \$4,545; time to complete, 2½ months.

Edward L. Dent & Co., of Washington, D. C., \$5,132; time to complete, 8 weeks.

VICKSBURG, MISS.—Plans by Assistant Engineer Coffey have been approved by Captain W. T. Rossell, U. S. Engineers, for improving the Mississippi here. They provide for dykes and dredging.

ATLANTA, GEO.—The following bids for construction of public buildings, near Atlanta, Geo., were received by Captain J. W. Jacobs, Assistant Quartermaster, U. S. A., August 5:

John H. Mathews, Atlanta, Geo., officers' quarters, No. 6, \$15,398; officers' quarters, No. 7, \$15,398; officers' quarters, No. 8, \$15,398; officers' quarters, No. 9, \$15,398; storehouse, \$5,258; oil-house, \$567; N. C. O. quarters, No. 34, \$5,113; stable, \$5,154; corral, \$1,984; total, \$84,781.

D. M. Compton, Atlanta, Geo., \$21,544, \$21,544, \$21,544, \$21,544, \$8,005, \$1,102, \$7,038, \$7,038, \$12,846; total, \$130,209; no bid on corral.

Atlanta Construction Co., Atlanta, Geo., \$18,400, \$18,400, \$18,400, \$5,666, \$595, \$6,840, \$6,840, \$9,845; total, \$101,387; no bid on corral.

William McConnell, Atlanta, Geo., No. 6, \$21,905; storehouse, \$5,352; oil-house, \$810; N. C. O. quarters, \$7,644; stable, \$5,669; corral, \$2,401.

Broomhead & Street, Atlanta, Geo., \$20,551, \$20,551, \$20,551, \$20,551, \$5,377, \$685, \$5,825, \$5,825, \$9,346; total, \$109,266; no bid on corral.

Harris & Co., Newport, Ky., \$15,080, \$15,080, \$15,080, \$15,080, \$5,000, \$1,000, \$9,500, \$9,500, \$5,100, \$2,700; total, \$84,039; bid on all.

WASHINGTON, D. C.—Bids for constructing three steel cruisers of about 4,500 tons displacement each and two steel gunboats of about 1,700 tons each were opened by the Secretary of the Navy, August 8. On Cruiser No. 1, Cramp & Son, the only bidder, bid \$1,248,000. For Cruisers Nos. 4 and 5 and Gunboats Nos. 3 and 4 proposals were divided into three classes: Class 1, both hull and machinery to be in accordance with the plans of the Department; class 2, both hull and machinery to be in accordance with the contractor's own plans, guaranteed to give the requisite results; class 3, hull to be according to Navy Department plans, with machinery according to the contractor's plans. The proposal of Cramp & Son, of Philadelphia, for Cruiser No. 1 is of class 3, or according to the mixed plans.

For Cruisers Nos. 4 and 5 Cramp & Son proposes to build hull and machinery both according to the Department's plans for \$1,410,000 each. The bid for the same cruisers built according to their own design throughout is \$1,335,000 each, and built according to the mixed plans \$1,405,000 each.

The only other bidder for the cruisers was the Union Iron Works of San Francisco. They bid only for the cruisers' hull and machinery, in accordance with the plans of the Department. Their bid was \$1,428,000.

In the bids for Gunboats 3 and 4 F. Palmer, Jr. & Co., the firm with which Mr. Quintard, John Roach's assignee, is connected, bid \$490,000 each. According to the Department's designs entirely Cramp & Son proposes to build the gunboats at \$495,000 each.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 12. } PUBLISHED EVERY SATURDAY.

NEW YORK, AUGUST 20, 1887.

LONDON, SEPTEMBER 3, 1887.

SINGLE COPIES, TEN CENTS. } IN AMERICA
Subscription, \$4.00 per year in advance, post paid. }
SINGLE COPIES, SIXPENCE. } IN GREAT
Subscription, 20s. per annum in advance, post paid. } BRITAIN.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE SANITARY ENGINEER AND CONSTRUCTION RECORD (New York), and crossed — & Co.

Continental subscriptions are also received by F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

When a change of address is desired, both the old and new addresses should be given.

A PLAN TO PROVIDE CHICAGO WITH SUB-CELLARS AND TRIFLE WITH THE SEWERAGE PROBLEM.

WHENEVER a knotty problem in public works is to be solved a number of amateurs almost invariably appear on the scene and gratuitously offer solutions and valuable (?) technical advice with a confidence and an assurance often far exceeding that of experts with long experience. Sewerage works in particular seem to be a favorite subject for such self-constituted authorities and have produced a new variety of *homo sapiens* commonly known as the "sewer crank." He has made himself conspicuous in almost every European country and has been frequently met with in our own. One of his latest effusions comes from Chicago. Oblivious of the fact that from Mr. E. S. Chesbrough to the present Drainage and Water-Supply Commission, professional engineers have been wrestling with the problem of that city, there appears a Mr. Gordon Nott who, in a lecture before the Grant Club, presumes to solve the difficulties in "a very simple manner."

As is usual with such men, he ignores past history and experience, "as there is but little there that will aid us in dealing with the question of sewage-disposal of Chicago," and evolves the solution from his inner consciousness.

Our readers are generally familiar with the fact that Chicago is situated on a nearly level plain lying a few feet above Lake Michigan and about seventy-five above the Desplaines River, a small affluent of the Mississippi River, about thirty miles west of the city. It has been the dream of Chicagoans for many years to cut a channel from Lake Michigan to this river, principally to establish a large navigable waterway between Chicago and the Mississippi, and incidentally to dispose of the city's sewage in an effective way. Mr. Rudolph Hering, Chief Engineer of the present Drainage Commission, has reported this to be the most economical solution of the problem, and in every respect the best one, provided a sufficient quantity of lake-water is sent with the sewage to thoroughly dilute it and to deprive it of its offense-giving qualities. The cost of the project has been estimated at about \$25,000,000.

Mr. Gordon Nott, however, believes that less than \$10,000,000 will solve the problem. He proposes in the first place to abolish the present sewers and construct a new separate system for the whole city lying some twenty or thirty feet below the present one. This, he believes, will give "an entire new basement and, in some cases, a sub-basement to the future great city," which is the keynote to his great scheme. He gives no estimate of cost for this new system of deep sewers, believing that the advantage of obtaining these basements would more than pay for it on every street, (!) forgetting that the blue clay underlying the city makes deep drainage practically unnecessary for this purpose and that basements have already been built wherever desired.

Mr. Nott then proposes to carry the sewage from this low level by means of a tunnel 30 miles long through rock to the Desplaines River, for which he estimates a cost of \$9,161,000. Before discharging the sewage, however, its sludge is to be precipitated with lime in basins covering 350 acres. For these and for the precipitation itself no estimate of cost is given, but the threadbare story is again told that the profits from the sale

of the sludge will fully pay the expense, whereas a half-million dollars annually would hardly pay the cost of purifying the Chicago sewage of today, while the sludge would be practically worthless.

But Mr. Nott's genius has not exhausted itself here. In some mysterious way, the sewage while still in the sewer is to be partly purified by agitation. The fall into the low-level sewers is to be put to use at numerous points in developing a power for compressing air to operate the "agitators." He has evidently heard something about purifying water by aeration and plunged with this idea into his sewer. If he had the remotest conception of the mechanical and chemical processes necessary to accomplish what he proposes, he would at least have left his agitators out of the scheme.

However, all communities having important municipal problems to solve are afflicted with the suggestions of the self-constituted adviser and the crank. We have had them in this city in the consideration of our new water-supply problem, Milwaukee is now apparently likewise afflicted, and Chicago cannot expect to be exempt.

To their credit, though, it may be said, they furnish padding material to the daily newspaper editor in a dull time, and occasional amusement to the engineer who has time to read their effusions.

HOW TO DRESS IN HOT WEATHER.

THE *Epoch* of August 5 contains three papers on "How to Keep Cool and Well in Summer," by Drs. Cyrus Edson and Willard Parker, and Mr. David Jardine, which are in the main full of sensible advice. But Dr. Edson says it is best to wear dark clothing in summer, because black radiates heat more freely than white, and says that animals living in the Arctic regions are white, because that color holds the bodily heat. Dr. Parker, on the other hand, gives the usual opinion that light-colored clothing is best in hot weather. Dr. Parker is right and Dr. Edson is wrong.

The experiments of Coulier ("Expériences sur les étoffes qui servent à confectionner les vêtements Militaires, Jour. de la Physiologie, 1858,") show that the difference of absorption and radiation between different colors of the same stuff are not perceptible in the shade at temperatures between 70° and 100° Fah., while the white is much less absorbent than the black when exposed to the rays of the sun.

Dr. Edson's theory of the cause of the white color of animals in the Arctic regions, which we suppose he would extend to explain why the black races are found in the tropics, is one that is not in the least tenable.

The great point to be kept in view in selecting clothing for hot weather is, not so much to provide for the hottest part of the day as for the evening when the temperature falls, and when cotton gauze underclothing is likely to lead to chilling the surface and to lay the foundation for rheumatic neuralgias of various kinds.

Thin woolen underclothing and light colored cotton stuffs for outer wear during the middle of the day are the best. The clothing should be loose to allow free circulation of air and evaporation from the skin. Tights are hot, though they may look cool on the stage.

THE fifteenth annual report of the Local Government Board of England, with its appended documents, is not inferior in interest and importance to any of the preceding volumes of the exceedingly valuable series of which it forms a part. Dr. Buchanan explains that the work of the department during 1885 was largely concerned with cholera, and that, having made a special report on this subject, the present volume is devoted to other matters.

Of these the newest and most important is the connection of scarlatina with disease in milch cows, the investigations of Mr. Power and of Dr. Klein with regard to which have been already noticed in THE SANITARY ENGINEER AND CONSTRUCTION RECORD. Some additional data are given in the present report, among which is an important statement by Dr. Klein that he has obtained from the blood of ordinary human scarlatina a micro-organism apparently identical with that found in the ulcers on the udders of the cows from whose milk Mr. Power proved that scarlet fever had been spread. This peculiar disease of the cow, which appears to be due to the same cause as scarlatina, and to be capable of producing the disease in man, is not one which makes the animal very ill, and it may easily be overlooked.

Scarlatina is pre-eminently a disease of England and Wales, in which it causes from 17,000 to 18,000 deaths annually on the average, and the consequences of this discovery are likely to be of great practical importance in a preventive point of view.

Another important advance in knowledge is the discovery by Dr. Klein of the specific micrococcus, which is the cause of what is known as the foot-and-mouth disease, or contagious apthæ of cattle, and especially of the fact that it is probably possible to successfully vaccinate animals against this disease. The experiments reported in previous volumes as to the efficacy of various disinfectants have been continued, with the result that the perchloride of mercury (corrosive sublimate) has greater antiseptic and disinfecting powers than any other known substance, but that the species, pedigree, and stage of growth of various micro-organisms differ widely as to the power of resisting the poisonous action of this salt. Fortunately, those micro-organisms which are the most dangerous are the easiest to kill.

Another interesting result obtained is that ozone seems more antagonistic to the ordinary bacteria of putrefaction than to the bacteria which cause specific disease.

Dr. H. F. Parsons furnishes a report on the manufacture of rag flock in reference to the possible dissemination of infectious disease by this and other products of woolen rags, in which he describes the various processes employed in such manufactures, and states as the result of his inquiries of medical officers of health in the rag-working districts and of flock manufacturers, rag merchants, and upholsterers, "that while workpeople engaged in the manufacture of flock suffer from certain symptoms produced by the irritation of inhaled dust, instances in which infectious disease had been contracted by them were scarcely to be met with." He also thinks that "workers among woolen, or partly woolen, rags are exposed to less danger of infection than workers among calico rags. The disease most likely to be propagated by rags is small-pox, and against this vaccination of the workpeople is the most certain preventive measure.

In the process of paper-making the rags are thoroughly and effectually disinfected, so that the product is not a source of danger to the community, but in making flock such disinfection is not obtained, and there is, therefore, more reason for asking that all such rags be disinfected.

It will be seen from this brief and incomplete sketch of the contents of this volume that it is one which every sanitarian must procure and study.

THE City Council of Atlanta has passed an ordinance which provides that the Board of Health can investigate any suspected well, and if the water is found impure can so declare; and that after the well shall have been declared impure any one who shall use water from it for drinking or in making food shall be summoned to appear in police court for trial. The object is excellent, but it seems to us that it would have been better to have stated what would be considered impure water, and then to forbid such use absolutely. Under the terms of the ordinance the water from a polluted well may be used for washing purposes, and if a child takes a drink of water drawn for such purposes it is the child that is to be prosecuted instead of the person who drew the water. It would be well, also, to state distinctly what the penalty is for violating this ordinance.

LEPROSY IN LOUISIANA.

THE New Orleans *Times-Democrat* of July 22 contains a pathetic letter from one of the unfortunate persons in Louisiana who are afflicted with leprosy, pointing out that such persons can get no work, that they cannot be admitted to a general hospital nor isolated in private houses, and appealing for some provision for them; and upon this makes some sensible and timely editorial comments. There are at least thirty known lepers in the State, besides others whose systems are affected with the disease, and in whom it will probably show itself sooner or later. The great majority of these cases are due to heredity, and the danger of acquiring the disease by direct contagion is extremely small, yet it does exist, and should be guarded against in time. Says the *Times-Democrat*:

"To allow a leper to remain at large, mixing with other people, intermarrying with healthy families, and sending his children to the public schools, is to tamper dangerously with the public health. We have allowed this disease to smolder away in Louisiana too long. It can be extinguished to-day with very little trouble and at very little expense by the establishment of a leper hospital or asylum; and this would at the same time be a blessing to these unhappy people, who now, in their last days, have to hide away from view on account of the popular repulsion to them, and who receive none of the medical treatment they so much need to mitigate their suffering. Cannot the Legislature give the State a leper hospital? It ought not to cost over \$3,000 or \$4,000 a year at most—probably half as much—and it will in ten years extinguish leprosy in Louisiana forever. Will not private charity do something for these people?"

The case is one which requires both State aid and private charity, and it is to be hoped that both will be provided.

FIRE-BRICK PAVEMENTS FOR ROADWAYS.

A REPORT has been made public to the effect that a specimen piece of fire-brick pavement put down in 1885 on Pearl Street, Cincinnati, has failed utterly. The description given states merely that the foundation was sand, well rolled, but says nothing as to the thickness of the brickwork. It has never been claimed by the advocates of brick pavements that it was suitable for very heavy traffic; and it is possible the mistake has been made in this case of subjecting it to a traffic for which it is not fitted. A thin pavement on a sand foundation would be in such case pretty sure to fail.

It may also be that the bricks were not of the right sort, as they need to be hard-burned and vitrified throughout. Such bricks are reported to have stood a crushing strain of over 8,000 pounds per square inch, approaching in this respect the lower grades of granite. It would be manifestly unfair to condemn the use of brick altogether in consequence of an indefinite report such as this is. We are inclined to believe that, under right conditions, there is a wide field to be usefully occupied by well-made brick pavements.

OUR BRITISH CORRESPONDENCE.

Intimate Terms between Mr. John Thompson and his Employees—German Regulations calling for a Pictorial Device in Trade-Marks Abolished—Sheffield Water-Works Company—East London Water-Works—The Carpenters' Company.

LONDON, July 27, 1887.

THE remarks made at a Jubilee fete, when Mr. John Thompson, the builder of Peterborough, entertained his workmen a fortnight since, show the amount of "touch" between that successful builder and his employees. They further show that a good master is appreciated by his workmen. Mr. Thompson stated that amongst those present was a man who had been working in the firm close upon sixty years, and had never worked for any other; that there were others present who had worked between forty and fifty years, and a larger number also, twenty to thirty years. He stated that a few weeks since he received a letter from his workmen expressing their sympathy with him, that notwithstanding the fact that he was finding them employment, business was not so good as it had been for a long time. The men, therefore, volunteered to second him in any effort he might make to obtain contracts at a reduced cost, and offered to make personal sacrifices to that end. It is not often that one finds such intimate terms between employer and employed, but when they do present themselves, it is pleasurable to record them as highly creditable to both sides.

Patentees and manufacturers should note that the German regulations calling for a pictorial device in the trade-mark has been abolished.

A few weeks since I gave particulars of the arrangement made between the Sheffield Water-Works Company and the Corporation, whereby the latter will take over the water-works for the good of the town. It would appear as though there was friction between the two parties, for I hear a report that the water company has served the Board of Guardians with a notice that they will cut off the supply from the workhouse, containing 1,400 paupers, unless a claim for six years' rent of hydrant is met. Under the present peculiar condition of the law, the guardians are prohibited from paying any such claims at a later date than three months after due, and, without obtaining the Local Government Board's sanction, they plead they are unable to pay, and request the company to wait till such time as permission can be obtained. The company, however, decline to wait, and it remains to be seen whether they will enforce their claim under this anomalous state of the law.

The East London Water-Works, who were a few months since providing their customers with eels in their water-supply, are again to the fore. The supply is intermittent, and for some time past it appears that the unfortunate people dependent upon this company have had to go on very short commons. A few days since, however, no water was supplied throughout the whole district of West Ham for twenty hours. This, coming after the regular deficient supply, has been a matter of annoyance as well as danger, owing to the long spell of hot weather. Some of the customers state that for weeks past they have had insufficient water from 8 o'clock at night till 9 the next morning, even for such purposes as flushing out closets. It will be a bad thing for water companies, as proprietary concerns, if complaints of this kind continually present themselves, as the question of the Government taking over the business will then, of course, again present itself.

The Carpenters' Company has instituted an examination for efficiency in theoretical and practical acquaintance with the craft, and members who pass this examination will have a certificate awarded to them. The first examination takes place in June next.

SAFETY-VALVE.

OUR SPECIAL ILLUSTRATION.

OUR special illustration this week shows a hall in the Tiffany House, New York City. Messrs. McKim, Mead & White, architects.

OUR DETAIL SHEET.

WE give this week a sheet of details showing sketches from the Chase House, Annapolis, Md., a pilaster and two elliptical arches from Fells Point, Baltimore, Md.

RECENT SEWER CONSTRUCTION.

No. VII.

(Continued from page 630, Vol. XV.)

CHISWICK SEWAGE-WORKS.

[Prepared for THE SANITARY ENGINEER AND CONSTRUCTION
RECORD by Joseph Hetherington, Resident Engineer.]

In recent inquiries and discussions about the disposal of town's sewage, the outfall-works of Chiswick main drainage have been frequently referred to, the advocates of precipitation processes using them as illustrations of the efficacy of chemical treatment of sewage; the opponents holding them up as proofs of failure to clarify sewage by such processes. The works, interesting in themselves, are additionally so because of the complete records of the work done, the quantities of sewage, sludge, cost, etc., instituted by the late surveyor of Chiswick, Mr. G. R. Strachan, and kept up to date. It is proposed in

Chiswick sewage-works were built in response to a demand from the Thames Conservancy for the sewage to be taken out of the river, the demand being backed up by power to exact a penalty of £100 a day till it was complied with. London was specially exempted from this penalty, and it continues to pour a small river of sewage into the Thames. Chiswick, being the first parish outside the privileged boundary, immediately received attention at the hands of the Conservancy Board, and it would appear to have been more amenable to pressure than contiguous parishes, for in nine years from the passing of the act (in 1867), the town had adopted the scheme of Mr. H. O. Smith, and in three years more had got its works built, its main sewers laid, and commenced treating its sewage, while pollution, both directly by drains, and indirectly by cesspools, still goes on all around it. A high standard of purity of affluent is insisted on, and the works that have been built are closely watched at the same time, that the penalties, where there are no works, have grown to such enormous amounts that the Conservators have to look helplessly on at the pollution they were empowered to prevent. This state of things is an illustration of the futility of legislation when the entire body of inhabitants resists its enactments, for the enforcement of the penalties would bankrupt the population, if a magistrate could be found who would impose them.

as possible, and up to 1883 only about half the roof-area drained into the sewers, the water from the other half being disposed of in cesspools. At the time the works were designed it was assumed that the water-supply was about thirty gallons per head, and the population being then 10,000, a dry-weather flow of 300,000 gallons was expected. An equal allowance was made for rain, and two pumps were put down each capable of lifting 1,200,000 gallons in twelve hours, which was the flow expected in a rainstorm when the population had doubled (double the population now resides in Chiswick): but so quick does the roof-water arrive in a heavy rainstorm that both pumps together can hardly keep pace with it. This is partly owing to the whole roof-area of houses built since 1883 being drained into the sewers, and in part to a portion of road-water admitted recently. The bulk of road-water, however, is disposed of in cesspits under the crown of the roads, whence it rapidly soaks away into the gravel and sand. No provision was allowed for subsoil and river leakage, and to these causes a great difference between the calculated and actual flows is due. The effects of rainstorms, of tidal leakage, and subsoil leakage will be illustrated further on by diagrams.

Figure 1 is a sketch map of Chiswick parish, the shaded areas roughly representing the built-up parts of the parish. It contains an area of 1,300 acres, once nearly all laid out

MAP OF CHISWICK PARISH

the following paper to give a somewhat detailed description of the works as they now are, with diagrams showing the effects of rain, tide, and leakage on sewage flow, and accurate and reliable particulars of the quantity of sewage and sludge per head of population, etc. It may have occurred to some that descriptions of large and complicated works, instead of being given before the works have been tested, would be of greater value if written after the works had been in operation. Such advantages as knowl-

• SECTIONAL VIEW •

• DETAILS OF REVOLVING SCREEN • CHISWICK •

When the Conservators had been satisfied by the removal of the solids from its sewage, Chiswick found fresh trouble with the sludge. A neighboring proprietor haled the Local Board into the Court of Chancery for polluting the air, and under pressure again filter-presses and other improvements were added, bringing the works up to date in all essential particulars.

FIG. 7.

DETAIL OF REVOLVING SCREEN

Prior to this scheme, the drainage of the houses near the river—being that of the greater part of the town at that time—was discharged directly into the river, and the houses inland disposed of their drainage by cesspools. As the parish is extremely flat and lies low, all the sewage has to be pumped to command the tides. The sewers have a gradient of 1 in 1,000, and are principally pipe-sewers laid in many places below the level of the subsoil water. An effort was made to exclude as much rain-water

as market gardens ; its ratable value about £105,000, and its population has grown from 8,500 in 1871 to 20,000 in 1886, and is still rapidly increasing. There are two main intercepting sewers, marked A and B in Fig. 1, which convey the collected sewage to the pumping-station, marked C, where it is pumped, treated with chemicals, and then discharged into the river.

The pumping-station and outfall-works are on one site of $5\frac{1}{2}$ acres of land on the shores of the Thames (see Fig. 2). The sewers enter the works on the left, their invert at this point being at datum line. The sewage passes through a screen on its way to the pump-wells. Here it is raised nineteen feet, and delivered into a winding channel, where the chemicals are added and mixed. The winding channel conducts it to a distributing channel on the left of the tanks; sluice-doors in this channel communicate with each of the right tanks, and any one may be filled at pleasure. After settling in the tanks, the affluent is drawn off by floating arms and discharged into the river, and the sludge swept down to the pressing-house and dealt with by filter-presses. The land on which the works are built lies low, and was under water at all high tides. An embankment has, therefore, been run along the river side, and the remainder of the boundary is by a thick concrete wall. The ground-line inside the area has been raised from twelve feet O. D. to nineteen feet O. D., which makes it $1\frac{1}{2}$ feet higher than the highest recorded tide. The works are about 350 yards from Chiswick House, owned by the Duke of Devonshire, and tenanted by the

Marquis of Bute. A considerable number of good houses are quite as near.

Before sludge-pressing was introduced the sewage received no better screening than could be given by a grating of iron bars—each bar an inch square, and each space an inch wide. Such a screen necessarily was most inefficient, and to remedy this Mr. Strachan put in a Baldwin Latham's patent revolving screen, illustrated at Figs. 3, 4, 5, 6, and 7. This is essentially a huge bricklayer's sieve made of iron, and made to revolve in a vertical plane at right angles to the sewer, with its open side toward the town. The sieve is divided into eight compartments by shelves fixed to the arms and in planes parallel to the axis. The wheel is carried on a 6-inch shaft through a heavy boss A. This boss is extended to the front by brackets (figured in Figs. 3 and 5), so arranged as to leave an annular space round the shaft, and from the front side of the boss, as well as from the back, arms of 4x1-inch iron are extended to the rim. The spaces between the front and back arms are closed by shelves of sheet-iron $\frac{3}{8}$ -inch thick, shown in Fig. 5 and enlarged in Fig. 6. The spaces in the back are subdivided by light T-irons to carry the wire netting, made up in sixteen sections and bolted by hook-bolts to the arms and T-irons. The wire used is No. 12 and 14 B. W. G., galvanized and woven so as to give a mesh $\frac{1}{4}$ -inch square. Motion is given by a small vertical engine in the engine-room above, and transmitted by a vertical shaft through gearing to the screen, which is revolved at the rate of about one and one-half revolutions per minute. The sewage is spread into the screen by a bell-mouth, into which the two intercepting sewers discharge, and as it passes through the screen on its way to the pump-wells, all solids that will not pass through a hole one-quarter of an inch square are stopped. The paper and such like matters cling to the netting, and when the section they are in reaches the position indicated between 1 and 2, Fig. 3, jets of water from a force-pump are played over the netting, causing the clinging matters to drop on to the shelf.

Corks, brushes, and such like solids float toward the rim at first, where they are kept till the shelf they are on rises to 2 in Fig. 3. They then begin to go with the rush of water along the shelf in the direction of the centre, passing through openings between the brackets and dropping into a trough of semi-circular section which is placed in the annular opening at the centre. The trough figured in Figs. 4 and 5 is closed at one end, and opens at the other into a hopper which carries it. A worm on the shaft pushes the solids along the trough, whence they drop into the hopper. An elevator carries them from there up into a truck placed below ground. An enlarged section of the rim is shown at Fig. 6, and an India-rubber lip which keeps the space between the screen and brick-work closed. As it is difficult to renew this lip at Chiswick, it is proposed to fix wood on the face of the rim and trim it up true and close to the brick-work.

(TO BE CONTINUED.)

FRUHLING'S SELF-ACTING FLUSHING-APPARATUS.*

THE sewers of Königsberg were of such a description as to require frequent flushing, and as the use of the town water-supply at stated intervals would have been too costly, the Municipal Engineer, Mr. A. Fruhling, has devised this apparatus, which has proved most successful. Many thousands of these flushing-chambers have been in operation since they were first used in May, 1883. The construction of the apparatus is explained by reference to two diagrams. The exit-pipe, at the bottom of the flushing chamber, is closed by a valve, which valve is raised by the action of a balanced float. When the chamber is empty the valve sinks on to its seating, and closes the outlet pipe, and the ordinary flow of sewage-water gradually fills the chamber until the level is reached at which the hollow float would rise but for the retardation due to a subsidiary float, shaped like a scoop, which is attached to the principal float by a jointed lever-arm, actuated by a rolling weight confined in a cylinder, so as to alter the centre of gravity when lifted to the required level by the inflow of water. As soon as the water has filled the chamber, the valve is raised, and the counter-balance tilts and empties itself while the water is rushing into the sewer, keeping up the valve which closes the exit until the chamber is nearly empty, when the float again sinks and closes the outlet as before.

CONVENTIONAL SPECIFICATIONS.

IN speaking of the stereotyped form of clauses and the conventional manner of making them into a specification of the whole, or of copying the same old form of specification over and over again, with a few alterations as to dimensions, the *Building News* says:

Specification-writing, like legal draftsmanship, has rather obscured than made clear the duties of those who are entrusted to carry out the intention of the author. In both of these forms of professional prescriptions, the verbiage is by no means any gauge of the comprehensiveness or clearness of the draftsman; sometimes, indeed, the greater the verbosity the more doubtful is the meaning conveyed. Nor is curtness of phrase always a sign of clearness and intelligibility. It often is a substitute for knowledge and precision. Such a clause as "All the materials to be of the best quality and approved by the architect" conveys very little information. The word may mean "best" of a certain kind; it may imply best of the kind generally used by the architect, not necessarily the best quality that can be procured or best for its application. These adjectives, however, embody in any easy uncompromising sort of way what is nevertheless to be inferred, without committing the writer to any statement that would expose his ignorance of materials. It is not at all unlikely that some of the vague clauses found in specifications are derived from the descriptive agreements of tradesmen who have supplied materials and workmanship, and who were careful not to bind themselves to any exacting terms. Definite prescription requires an extensive knowledge of materials, trade-marks, and the methods of workmanship, a degree of attainment that can only be expected from knowledge and practical experience. A young architect would, for example, be safer to describe the stone to be used "to be of the best quality, free from all vents, shakes, and other imperfections," than if he were to describe a particular quarry without knowing the different beds and qualities, which would tie him to the acceptance of perhaps an inferior stone. So with regard to timber. The customary clause is that the timber is to be from the Baltic, or "to be of the best Dantzic, Riga, or Memel yellow fir," though there are few architects who obtain the best from either of these ports. A more experienced architect who knew something of the timber trade would be contented if he could be sure of getting medium quality Memel or Dantzic, from some well known shipper. A favorite clause is that "no Swedish timber is to be used," though it is worth notice that "mixed" quality Swedish red or yellow deals are often better than so-called first quality Baltic. The specification phrase—"the best timber"—means, in the timber merchant's vernacular, straight-grained timber, free from knots. Probably there is more room for evading the intention of the architect in this part of the specification than in any other; so many characteristics go to make up good timber—the mode of growth, time of felling, and nature of the soil. * * *

To avoid stereotyped phraseology, the result of copying one specification from another, the profession may do something. At present the tendency is to repeat a good general form *ad infinitum*. Specialization is avoided as being inconvenient, and local peculiarities of material and workmanship are not favored by the writer. On the contrary, the clauses are dictated by a knowledge of the materials of a very general and often imperfect nature. It is the information that has been picked up in the office during apprenticeship; acquired not from contact with quarrymen, brickmakers, timber importers, and workmen engaged in building, but more from office traditions. Once a general form has been adopted, it is transmitted to future generations. A special form for each new building would be exceedingly laborious and inconvenient, and to some extent certainly unnecessary. But clauses are repeated so often that they lose their original significance and force. Contractors get to look contemptuously upon an official jargon that they know has been applied to hundreds of very dissimilar cases. We may give a few illustrations. The conventional specification reads: "The mortar is to be compounded of stone lime and sharp, clean sand, mixed together in the proportion of one of lime to two of sand." The contractor takes little notice of the formula. The proportion is not attended to, there is no test specified, and the lime may be anything but fresh. Then, "sharp, clean sand"—how often we find sea-sand instead of clean pit sand. The clause has been interpreted in such a manner as to disarm criticism; the germs of mischief appear on the wall, but nothing can be done to rectify the mistake.

Again, as to the concrete or Portland cement, the ordinary clause is based on imperfect data. High tensile strength is generally made a condition, whereas the more practical test is the adhesive strength. It is well understood that the tensile test depends on several circumstances—the atmosphere, the mode of manipulation, temperature of water, etc., and may therefore be very misleading. Air slaking is a very important condition, but seldom insisted upon. The cement may be over-limed, which gives a high result at seven days, but is found to lead to expansion and cracking of the concrete mass. A tensile strength of 350 pounds per square inch at seven days increasing with the age is preferable. Mr. Mann suggests the following specification for adhesive strength: "The Portland cement shall be ground so that no more than 45 per cent. shall be stopped by a No. 176 silk sieve, and its adhesive strength after 28 days' immersion shall be 95 pounds per square inch; cement, as supplied for use, not less than 75 pounds per square inch. Six tests being employed in each case." The No. 176 silk sieve gives 30,976 meshes per square inch.

Another stereotyped clause prescribes the drains; so many feet of stoneware pipes of a certain diameter are specified, and the mode of jointing; little is said about the bottoms of trenches, nothing about ramming them, about gradients, about avoiding curves and sudden drops, the cleaning out of the pipes as they are laid, and other precautionary measures, such as testing. We have no space to go through all the trades and suggest improvements and point out omissions. What we complain of are the uncertainties and inexact descriptions of many matters which are left to the good sense and knowledge and honesty of the contractor. A great deal is left to the founder and engineer. The iron joists that are provided are often of Belgian manufacture, and need careful specification and testing. Details like bolts and nuts and threads are left to the maker. To pass to general ironmongery, the same generalities suffice. Contractors repeatedly fix door-locks of very inferior description because the specification is inexplicit about the kind of lock intended. The hot-water supply is one of the many special provisions that are left to the contractor or engineer owing to the imperfect or superficial knowledge of the writer. General directions can only be given, but these should be more intelligible than the phrase, "To provide and fix to the architect's satisfaction a hot-water apparatus, etc., etc." At least the position of the pipes, the kind of boiler, tank, or cylinder ought to be specified. The circulation-pipes should be directed to be placed in positions that will avoid the inconveniences of contact with the soil or waste pipes. There are a score of other technicalities which ought to be mastered before a competent or sufficient specification of a heating system is written.

Reference is made to the stereotyped phrases used in other trades but the above is ample to show that in England the same objections exist and the same questionable want of knowledge of details are to be found in specifications that we so often find here among the incompetent young men who "hang out their shingles" after being a year or two in an architect's office, and get work from impecunious builders and owners because they are satisfied to work for nothing, or next to nothing, while they are "making a name."

THE HARBOR OF MONTREAL.

A PLAN has been proposed by Mr. F. J. Gilman for building an embankment nearly a mile long, from the abutment of Victoria Bridge down to Bonsecour Market; this bank to be about 300 feet wide, and considerably higher than the highest flood ever known. By means of a division embankment, an upper harbor will be thus enclosed 4,000 feet long, 2,000 feet wide, and 27 feet deep, opening into Lachine, and also a lower harbor opening into the river, which will be about 1,900 feet by 3,000 feet. It is claimed that no damage will be caused to the waterway, but that by stopping the collection of ice and snow on the shallow area covered, there would be an equally free passage to all floods. Room will be afforded on the embankment for two lines of railroad forming junctions with the Grand Trunk and Canada-Pacific lines. The cost is estimated at two and a half million dollars.

THE Committee on Publication of Franklin Institute of Philadelphia has in contemplation the publication of an index of the authors and subject-matter contained in the first 110 volumes of the *Journal of Franklin Institute*, from 1826 to 1880, provided a sufficient number of subscriptions is obtained to cover the cost of the project. The subscription price has been placed provisionally at \$5. H. L. Heyl is the actuary.

PAVEMENTS AND STREET RAILROADS.

No. XI.

(Continued from page 293.)

SINCE wood and asphalt pavements have been extensively adopted in the best paved thoroughfares of London and Paris, and since the American experience with wood pavements has been unsatisfactory because of the improper methods adopted in laying them, and lack of care after being laid, we have thought it well to reprint in this series the paper by George Henry Stayton Assoc. M. Inst. C. E., with an abstract of the discussion thereon, which was had before the Institution in 1884.

Though the paper deals with wood pavements, for which the author apparently has a preference, yet with the discussion and criticism it elicited it is a valuable contribution on this subject, which our American readers will, we believe, appreciate.

Following this paper we propose to give the recent experience and present practice in several of the important parishes of London and in the city of Paris, the data and information having been secured during a recent visit to those cities.

WOOD PAVEMENT IN THE METROPOLIS.*

The necessity for stimulating the efforts of those persons who are actively engaged in the construction and maintenance of street carriageway pavements in the metropolis and large cities was strenuously urged during the discussions at the Institution in 1879, when the subject was brought forward by Mr. Deacon and by Mr. Howarth. The object of this paper is to call attention to the various wood-pavement works recently executed in the metropolis, and to a comparison of the results obtained thereby. Although the paper may not contain much that is new, the author ventures to think that the general interest evinced in works which tend to the efficient and economical maintenance of the carriageways of important thoroughfares, and the direct bearing which such works have upon the comfort and convenience of a community, may be sufficient to justify a review of the progress in this system of pavement.

It may not be uninteresting to consider for one moment the extent of the streets of the metropolis, and the nature of the materials of which the carriageways thereof are formed; and the author desires to tender his warmest acknowledgments to the president, who in his official capacity as the Chief Engineer to the Metropolitan Board of Works furnished him with valuable data, and to Mr. W. Haywood, M. Inst. C. E., the city engineer, and to forty-three chief surveyors of parishes and districts of the metropolis, for their courtesy in replying to his communications thereon. The information thus obtained has enabled him to present it in the tabulated form which will be found in Table I. in the appendix, according to which it appears that at the commencement of the present year the aggregate length of the streets of London amounted to 1,966 miles. Of that length, however, 248 miles are at present "new" streets, inasmuch as they have not been adopted by a local authority; consequently there are 1,718 miles of public streets under the maintenance of the various authorities, the carriageways of which consist of the following materials—viz.:

	Miles.
Macadam	573
Granite	280
Wood	53
Asphalt	13½
Flints or gravel	798½
Total	1,718

The extent of the vehicular traffic is equally remarkable, the result of inquiries instituted by the author showing that in the metropolis alone, at the present time, there are approximately 100,000 horses and 40,000 vehicles, the licensed cabs numbering 10,381, and omnibuses, etc., 2,223, and the estimated value of the horses, harness, and vehicles amounts to no less than £5,000,000 sterling. Obviously the ordinary wear and tear of these vehicles must in a great measure depend upon the condition of the street carriageways.

No doubt many members of the institution have a vivid recollection of the extremely unsatisfactory state of those macadamized carriageways in leading West-end thoroughfares, which have given place to wood pavement. It was rarely the case that such roadways were in a good state of repair; on a hot summer day they invariably emitted disagreeable smells and frequently gave off a great amount of dust; and it is scarcely possible to conceive anything more deplorable than the state of such streets whenever the surface became greasy or sloppy after rain. All things considered, there was not only undoubted cause for dissatisfaction, but ample justification in the outcry against the former state of things; as, what with damage to horses, harness, vehicles, and pedestrians' clothing, together with the sheer waste of money in laying down broken granite to be ground into mud, an alteration was most necessary.

The efficient condition of street carriageways is essentially a ratepayers' question, and the unprecedented adop-

tion of wood as a paving material in substitutions of macadam, proves that several of the metropolitan vestries and other authorities have taken a new departure, and apparently a step in the right direction. In expressing this opinion it will be readily understood that the author in no way desires to pass over the respective merits of granite, asphalt, or bituminous-concrete pavements, and of roadways formed with broken granite, flints, or gravel, as they are undoubtedly suitable for certain localities, and in many cases are economical as compared with wood. While therefore it is asserted that a properly constructed wood pavement possesses the advantages of noiselessness, surface elasticity, safety, and cleanliness, and is pre-eminently suitable and economical for business and residential thoroughfares having a high traffic standard, it should not be forgotten that in the case of narrow business streets leading out of main thoroughfares, wood pavement might be unsuitable, as by reason of the unimportance of the vehicular traffic, the blocks would probably decay internally long before they were worn out by the traffic. For such reasons, and from a sanitary point of view, it would appear that asphalt would not only be preferable, but also eminently suitable.

Large sums of money were expended during the early years of wood pavement revival, in the acquisition of patent rights of doubtful value, in experimenting thereon, and in foolish contracts. These stages have been surmounted, and the result is that street paving in the West-end has been almost revolutionized within a few years. Wood pavement has been termed a "West-end luxury," and in one sense the assertion is perhaps justifiable, inasmuch as not more than 4.38 per cent. of the wood pavement in London is east of the city, or south of the Thames.

EXTENT AND CONSTRUCTION.

The superficial area of wood pavement laid in London

FIG. 3. MODE OF JOINTING

FIG. 4. FORM OF STUD

FIG. 5

FIG. 6

during the last ten years has been 980,533 square yards, its length 53¼ miles, and the cost of its construction, together with subsidiary works, has probably involved an outlay of £600,000. It is now possible to drive through wood-paved main thoroughfares for a distance of several miles; (c. g.) wood pavement is practically continuous from London Bridge, the exception being the eastern part of the Strand, to any of the stations between Chelsea and Uxbridge Road on the West London Railway.

Obviously, much valuable experience and data have thus been gained as to the best mode of construction and maintenance, and as the author ventures to think that a paper on wood pavement would be incomplete unless it embraced every detail, however simple, he will endeavor to discuss the various points which arise, with a view to ascertaining whether wood has practically realized the expectation that it would prove to be a safe, convenient, and economical material for street carriageway pavements.

The suitability of "wood as a paving material under heavy traffic" was so fully treated by Mr. Howarth in 1879, that the author thinks it unnecessary to refer in detail to questions which have reference to the proper growth of wood, the cause and effect of wear and tear, and the method adopted for recording the traffic; the object being to describe at length the various points of construction which have hitherto been only partially considered, together with particulars of recent modifications.

Excavation.—The suggestion has been made that macadamized carriageways might be broken up expeditiously with the aid of explosive mixtures, but the author would hesitate to try it; as, however slight the concussion and vibration might be, there is little doubt that gas and water mains and services, especially those which have been in existence for a considerable period, would be injured. Practically there is little variation in the method adopted, the main object being to get the work done as quickly as possible. In preparing for the construction of the wood-pavement works in Chelsea, the method of opera-

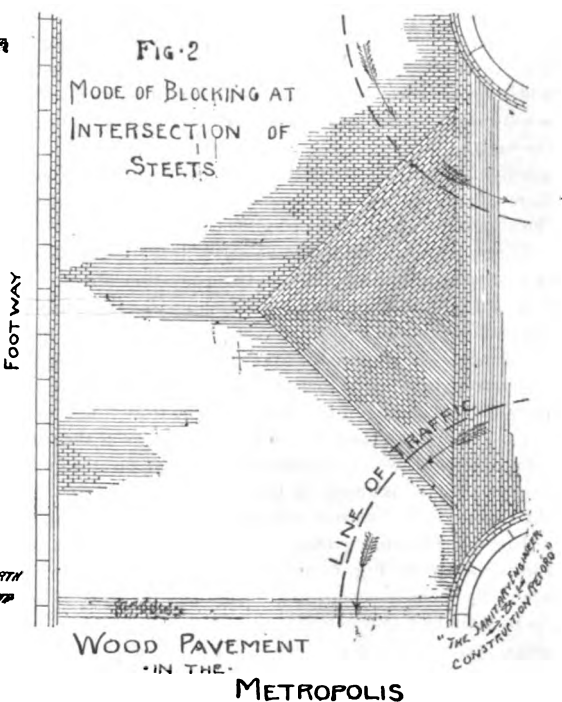

tion consisted in breaking up the macadamized carriageways by driving steel wedges into and through the consolidated layer of broken granite, commonly called mac, at intervals of a few feet. The surface or crust being thus "started," its removal was effected by prizing it upwards in lumps of a square yard or more with stout hand-levers, 6 to 8 feet long, after which it was easily disintegrated. As a rule, a depth of 9 inches of macadam was thus removed prior to the excavation of some 5 or 6 inches of foundation.

In those instances where the carriageway had previously been paved with granite upon a concrete foundation, as in Oxford Street, it was found unnecessary to disturb the concrete, since by adding about 2 inches thereto, and floating the surface, a satisfactory foundation was obtained, and considerable expenditure avoided.

Levels and Contour.—When the width of a street is irregular, and the levels of the footways on either side vary considerably, it is sometimes not a little complex to satisfactorily determine the question of level and contour; but when the longitudinal inclination is naturally slight and uniform, the width parallel, and the footways nearly correspond in level, as in Sloane Street, a very simple rule may be observed.

The practice of the author has been to first determine the level of the crown or vortex of the carriageway to be paved, and next to set out the levels of the channels, by allowing a rise to the crown equivalent to 1 inch in 3 feet (⅓) above the mean channel level. By slightly flattening the crown, Fig. 1, it will be observed that a contour is obtained which not only renders traffic easy, but is of pleasing appearance, and satisfactory in other points.

Whenever practicable, the longitudinal inclinations of the channels should not exceed 1 in 150, and it is desirable that the minimum depth of kerb exposed at the summit of a channel should be 2½ inches, with a maximum depth of 6½ inches at a gully. By the observance of this rule it

necessarily follows, that in a tolerably level street the provision of street-gulleys becomes an important item, but the extra cost, about 4 per cent., which their construction entails, is amply repaid, not only by the convenient and uniform appearance of the carriageway, but in the prompt and effectual removal of rain-water from the surface of the pavement. The author submits that this is an element of success in the construction of wood pavement which, unfortunately, is too often overlooked.

The longitudinal crown-level should be uniformly sustained from street to street whenever practicable, so as to prevent undulations; and it is likewise important that the crown should be extended transversely at all intersections, partly for the sake of appearance, but mainly to obviate the unpleasant effect which is caused by driving over a channel. The neglect of this rule is very apparent upon observing the effect of vehicular traffic over the crossings to Rutland Gate and Princes Gate on the south side of the Kensington High Road.

Foundation.—It is satisfactory to note that foundations consisting of single or double planks placed upon a bed of sand have been completely discarded, and that the fallacies of the so-called elastic foundation have given place to a more permanent system. It was only necessary, shortly after a fall of rain, to witness the effect of a vehicle being rapidly driven over a pavement which had been laid on the former system for a period of two or three years, to have ocular demonstration of its utter unworthiness. The series of little fountains of dirty water which have spouted up in the wheel tracks from the open joints would soon have dispelled the hopes of the most ardent believer in the theory; and the result not only made it inconvenient for pedestrians, but very soon caused the pavement to go to pieces.

Although lias-lime concrete has been used as a foundation, it may safely be asserted that 90 per cent. of the existing wood pavement is laid upon Portland cement concrete. The latter, properly prepared, is absolutely im-

*A paper by George Henry Stayton, Assoc. M. Inst. C. E., and printed in the Minutes of the Proceedings.

HOT-WATER HEATING AND FITTING.

BY "THERMUS."

No. VIII.

(Continued from page 213.)

FRICTION IN LONG PIPES.

In long pipes the friction of the water against the insides of the pipes must be considered. The insides of the pipes are then often called the "rubbing sides" or surfaces. In short smooth pipes under small head or pressures, the loss by friction is not very great when compared to the whole flow, but in long pipes passing large quantities of water it is considerable as it increases in a ratio (about) directly as the increase of length of the pipes and as the square of the velocity of the water through the pipes.

The loss to the flow by friction in pipes of four inches and upwards, under pressures and velocities such as is used in cast-iron water-mains, is well established and known to hydraulic engineers, many eminent mathematicians having considered the subject and formulated rules which some of our more recent investigators have verified or corrected, and which, in the hands of some of our hydraulic engineers, give results surprisingly accurate.

For small tubes, however, under very small heads of water, and such as can be found in heating apparatus, there is no very authentic data. Prony's formulæ is considered by Thomas Box as probably the most correct for small pressures and small diameter pipes, but perhaps as much or more dependence can be put in the tables of G. A. Ellis, C. E., of Boston, than in anything else extant on the subject, as they are largely made up from observations by himself and other hydraulic engineers in the United States.

TABLE No. III.

Friction loss in inches of water-head for each 10 feet length of different size clean iron pipes; discharging given quantities of water per minute:

U. S. Gallons Passed Per Minute.	Size of pipe—inside diameter.

He has constructed a table for friction in small diameter pipes of various sizes from existing tables reduced to

pounds pressures for U. S. gallons and 100 feet length of pipe. With his kind permission I have reduced and interpolated such parts of his table (No. 5 in his book), as I think would be likely to be of use to a hot-water engineer, to pressures represented by inches of water-head instead of pounds and for a length of 10 feet instead of 100 feet as in his table.

This table is No. III., and shows the friction loss in inches of water-head consumed in the straight pipes of an apparatus for each ten feet length of pipe, for the different number of U. S. gallons given in the first column.

For instance, should the difference of temperature between the flow and return pipe of any part of an apparatus appear to warrant a flow of 10 U. S. gallons of water per minute in a 2-inch pipe, .324 inch of the head will be consumed in each ten feet of the pipe in giving motion to the water and it will be lost as power. If the pipe is twenty feet long twice as much of the total head—or .648 of an inch—will be consumed by friction, as in the case just cited, but if five feet of pipe is used half only of the .324 inch of water-head will be consumed, or .162 of an inch.

The loss of head by friction in very short pipes compared to the loss of head by entry is small, but as the pipes become longer the friction loss increases about as the length of the pipe, whereas the loss by entry remains the same, so that a point is soon reached where the loss by friction is greater than the loss by entry. This point may be roughly placed at between 50 and 60 diameters of the straight tube.

Let it be borne in mind, therefore, that in a short tube the loss of head by entry may be a large percentage of the whole, but that in a long tube it may become comparatively small, and the loss by friction alone become great enough to use up nearly the whole head at our disposal.

With our subject, however, the loss by friction will be generally comparatively small, with small velocities and large diameters, as an inspection of the Table No. III. will show, but it also shows how rapidly it increases as we attempt to use small diameter pipes and try to get a given quantity of water through them by an increase of pressure.

Our table, therefore, may be likened to a table of resistances, and it can be used to determine approximately the comparative size of flow-pipes for an apparatus in which the resistance is to be nearly alike. For instance, it will be noticed that when one gallon of water passes through 10 feet of one-inch pipe in a minute the resistance is about $\frac{1}{10}$ of an inch of water-head, and that nearly 2 gallons will pass through the same length of $1\frac{1}{4}$ -inch pipe with the same resistance, 3 gallons through one $1\frac{1}{2}$ -inch pipe, 5 gallons through a 2-inch, 30 gallons through a 4-inch, 500 gallons through a 10-inch, and so on through the table; all giving a resistance of only $\frac{1}{10}$ of an inch of water.

It stands to reason, therefore, that if the 10-inch pipe will pass 500 gallons with so small a loss of head that 100 two-inch pipes may flow into it, each passing 5 gallons, and the resistance in all will be alike; or they may all take supply from it as they would in the flow pipe of an apparatus. Of course, if the pipes are all doubled in length, the resistance is doubled also, but what I wish to call attention to in the table is, that lines of equal resistance may be traced approximately through it for pipes of about the same length, though for different diameters, and that hereafter on proportioning the size of pipes for apparatus, this fact will be made use of.

(TO BE CONTINUED.)

REGISTRATION OF PLUMBERS IN LONDON.

OUR London correspondent writes: "Very great dissatisfaction indeed is being expressed on all hands in connection with the registered plumbers' movement, on the ground that the qualifications of a great many registered plumbers do not justify their admission. Consequently good men are no better off than they were before, the only difference being that they have to pay an annual subscription to the company, as registered plumbers, which, of course, they did not formerly have to do. The Plumbers' Company will certainly have to make an alteration in the matter, otherwise a very large number of good men, both journeymen and masters, will decline to figure as R. P.'s (Registered Plumbers), leaving the company in the proud position of having none but 'duffers' as contributors. So far as the public are concerned at the present time, they do not seem to have troubled themselves at all as to whether they are employing a plumber or a 'botch.'"

SOME VIOLATIONS OF THE PLUMBING REGULATIONS AND TENEMENT-HOUSE LAWS LATELY DISCOVERED BY THE INSPECTORS OF THE BOARD OF HEALTH OF NEW YORK CITY.

THE accompanying sketch shows a faulty arrangement of traps, wastes, and vent-pipes which form a "by-pass" for sewer-gas, recently discovered by an inspector of plumbing in each of ten houses in East Eighty-first Street, near Fifth Avenue, in New York City. It presumably was caused by ignorance and perhaps want of experience on the part of the plumber, and as he has been notified to make the work good by the Department of Health, and will probably do so, we refrain at the present time from mentioning his name.

The matter goes, however, to show that caution and a knowledge of what is to be guarded against is as vital or more so in any kind of construction as knowledge of the conventional methods of doing work.

In this case the sewer-air passed from the basin trapped into the untrapped overflows of the cisterns, escaping into the upper parts of the houses. Nor does it at first glance appear that the cistern or house-tank is untrapped,

and it is very evident that the designer, in his eagerness to place a trap between the overflow and the sewer that would not be evaporated, caused the whole trouble. He probably thought that the water from the basin flowing through the running trap would always keep it sealed, which undoubtedly it would, but he overlooked the fact that the basin trap-vent made a "by-pass."

Richard Disbrow, builder, was arrested on July 21 and brought before Justice Murray for refusing to alter defective house-sewers when notified by the Board of Health. These houses we have reported before and the plumber was arrested then for skin plumbing, but in the case of the house-sewer or work outside the front wall the owner has now been arrested, as this was not the plumber's work. The liability of the owner is recognized in all cases, but in those where he is supposed not to be aware of actual facts, the plumber who does the bad work is the one first proceeded against.

(TO BE CONTINUED.)

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

APPARATUS FOR WARMING WATER AT THE WASH-BOWL.

THE accompanying drawing illustrates a novel attachment for wash-bowl for warming water in limited quantities where no regular hot-water system is in use, and is the invention of Joseph Love, of Chicago, Ill.

It consists of a small closed tank or boiler of any suitable shape placed underneath the basin-slab. A branch from the cold-water supply to the basin is taken through the side, low down, or bottom of the tank and a special valve is used in it in such manner as to come under the position ordinarily occupied by the hot-water faucet of the basin. The stem of this valve passes tightly through a nut and tube and is carried above the slab, so as to simulate in all particulars the hot-water faucet with handle,

bibb, etc. A pipe from the top of the tank joins the upright tube below the slab about as shown or in any manner suitable. A suitable gas-burner for heat is placed underneath the tank and the apparatus is ready for use. Its action is as follows: When once water is let into the tank it remains full afterward. When hot-water is required the burner is lighted until the water in the tank is sufficiently

warm. Then the faucet-handle is turned, which apparently opens the faucet on the slab, but in reality opens the valve in the supply-pipe to the tank. The cold water runs in and diffuses itself over the bottom by being fed down through the gooseneck and displaces the warm water by forcing it through the top pipe into the bowl through the bibb on the slab.

Should steam form by the boiling of the water it will escape through the bibb, as it always remains open. The products of combustion from the gas-burner can be passed off through a local vent by having the tank in a case or lantern.

Gas and Electricity.

E. G. LOVE, Ph.D., *Gas Examiner.*

THE *Gas Engineer* gives the following facts regarding the petroleum industry of this country: "Oil wells, numbering 53,000, have been drilled in Pennsylvania and New York since the discovery of petroleum, at a cost of \$200,000,000. These wells have produced 310,000,000 barrels of oil, which was sold at the wells for \$500,000,000. This represented a profit to the producer of \$300,000,000. The amount of oil exported is placed at 6,231,102,923 gallons. Independent of the oil business, there are about \$50,000,000 invested in natural-gas plants in Pennsylvania.

WE understand that the Coal Tax Bill and the Electric-Lighting Bill are not to be considered during the present session of Parliament.

MR. E. P. THOMPSON has found that the blackening of the glass of the incandescent lamps is chiefly due to the carbon particles which are driven off on first closing the circuit when the filament obtains a static charge. In order to avoid this Mr. Thompson has made lamps in which the filament surrounds a loop or stem of copper wire, which passes through the stem of the lamp and is connected to earth; the wire being also provided with several points which project towards the filament. The result is that when the static charge is received the carbon molecules tend to be projected upon the wire, and the blackening of the glass is prevented. Mr. Thompson's

theoretical explanation of the effect is certainly sufficiently plausible to merit consideration, but it appears to us that if this view were correct it would follow that incandescent lamps supplied with alternating currents should blacken much more rapidly than with continuous currents, and their life should be much shorter. We have not learnt that such a result has ever been observed, and it would almost appear that this objection is fatal to the static charge theory.—*The Electrician.*

COOKING by gas has greatly augmented the revenue of the Glasgow corporation. The consumption of gas in June has shown an increase of 800,000 cubic feet compared with June, 1886. This is due to the new department of the corporation in letting out stoves on hire. This experience should induce companies in large towns to go and do likewise.—*Gas Engineer.*

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

BOOKS ON VILLAGE IMPROVEMENT SOCIETIES.

CHERRY VALLEY, N. Y., August 5, 1887.

SIR: Will you kindly give me a list of the books most needed in organizing a "Village Improvement Society" in a small place where there is not much money nor enthusiasm, and consequently the more need for the society, and oblige, yours respectfully, MRS. A. M. DAKIN.

[Mr. B. G. Northrop, at one time connected with the Connecticut Board of Education, has written on this subject. We must refer our correspondent, however, to our readers for more explicit information.]

THE CONSTRUCTION OF CESSPOOLS FOR COUNTRY HOUSES.

SALEM, August 8, 1887.

SIR: I have a small house into which I am about to introduce city water and plumbing; but there is no sewer nor likely to be one for a long time. I am reduced, therefore, to a cesspool, and the question is how best to construct it under the circumstances.

In "Plumbing Problems," you refer to Philbrick's "American Sanitary Engineering" for directions as to the proper construction of cesspools. But this book only speaks in a very general way about them and gives no detailed directions as to the proper construction of any but those connected with irrigation systems. Nor can I find sufficient directions about them in any of the text-books I have at hand. I presume a tight cesspool of brick laid in hydraulic cement is the only *absolutely* safe kind. But such a cesspool would have to be emptied at very frequent intervals, which would entail great expense. Is there any way of using the liquid contents on the ground on a half-acre lot without its being offensive?

Would there be serious danger from a leaching cesspool 60 feet from the house and 120 feet from the well, the water of which is in constant use, the well being on higher ground than the cesspool, with the house between the well and the cesspool? There is a good fall from the house to the cesspool. The soil is gravelly. The nearest neighbors are over 200 hundred yards away. I presume a cesspool ought to be ventilated. What is the best way of accomplishing this?

How large ought a cesspool to be in a house in which there are one bath, one water-closet, one set basin, one kitchen sink, one pantry sink, three laundry tubs, household of three or four persons, one or two of whom are apt to take a plunge bath every morning?

If the kitchen sink is provided with a good grease-trap, will there be any need for any other grease-traps in the system? Yours truly, ARCHITECT.

GALT, ONTARIO, August 10, 1887.

SIR: I desire to know how to construct a cheap cesspool for a country town where there is no sewer and where the rock is close to the surface, there being only one foot of loose earth on top of rock.

The people here have been in the habit of digging a large pit and filling it with cobble-stones, then letting the water, etc., soak through them. In my judgment, I condemn this system and suggest instead to build a vault and cement it tight, and when it fills pump it out after disinfecting it and use it on the farm. Am I right in doing so? An early reply will much oblige, Yours truly, C. FITZGERALD.

[The cesspool problem is a very perplexing one. All cesspools are objectionable. They necessarily retain putrescent matter to decompose and pollute the soil and air about the house, while the proper way is always to convey the refuse to a safe distance from the house without giving it time to become putrid. This is the office of a public sewer. Where no such works exist, and where water-closets are used, the cesspool becomes a necessary evil. Undoubtedly the best way to treat the sewage of a single house or group of houses is to distribute it on the ground on or near the surface. Where there is an acre or more of sloping land, this can be done easily, as described in Philbrick's "American Sanitary Engineering," pp. 91-94. If subsurface irrigation is preferred, the details are fully described in a small pamphlet entitled "The Disposal of Sewage in Suburban Residences," published by THE SANITARY ENGINEER AND CONSTRUCTION RECORD, and for sale at this office. All such methods presuppose an area of an acre, or nearly that, for every house, unless the soil be extremely porous or well drained and having a good slope, where a smaller area might answer, but rarely less than half an acre under the most favorable conditions.

Of course there are thousands of cases where the size of the lot is too small for such treatment. The alternative generally taken is to dig a porous cesspool, with walls laid up without mortar, and allow the contents to soak into the soil.

This method has a certain sanction afforded by its very general use, but it is not to be recommended, especially where the water-supply for drinking is taken from wells in the immediate neighborhood. The argument often heard that "the well is on higher ground than the cesspool" is not sound, unless the cesspool be lower than the *bottom* of the well, for that is the level from which most of the water is drawn. A distance of one or even two hundred feet does not insure immunity from soakage where the nature of the soil favors it. Even a rocky soil can convey water through cracks and seams in the ledge for a greater distance without great descent.

A clay soil is the softest, but no rule can be given as to any distance which would insure safety in any case, for the question is a blind one that no one can determine with any certainty. The only safe way is to abandon all thought of drawing drinking-water from the neighborhood of vaults and cesspools, or similar sources of pollution. Even then the soaking cesspool is continually accumulating foul matter, to putrefy at such a depth below the surface that it constitutes a hoard of poison which may become active when future houses are built on the spot. No lapse of time can be considered sufficient to purify these accumulations when covered up beneath the surface at such depths as to prevent the free circulation of air.

We, therefore, recommend *tight* basins for cesspools, made with walls of hard brick, two bricks thick, in hydraulic cement and plastered with the same inside like a rain-water cistern. Of course this method requires all the water-supply of the family to be pumped or otherwise removed from the cesspool at frequent intervals, which may be onerous where a flowing water-supply is used. This gives force to the maxim, often urged in these columns, that no public water-supply should be developed in any village without an intelligent and well-developed system of sewerage at the same time.

All communities who violate this rule are incurring risks which, in the light we now have on such subjects, are unjustifiable. The amount of risk may be small at first in many cases, but increasing population multiplies it unawares, till some fearful epidemic breaks out such as we often hear of in small villages where wells and cesspools are used.]

THE MECHANICAL TRADES OF PHILADELPHIA AND THE CENTENNIAL CELEBRATION.

(Special Correspondence.)

PHILADELPHIA, August 16, 1887.

THE mechanical trades of the city are taking much interest in the coming Constitutional Centennial celebration, and vast preparations are being made for participation in the mammoth street parade that is being arranged for. Nearly every branch of mechanics will be represented by exhibitions of the work, and in some cases with men actually engaged at work on floats drawn in the procession. The Master Builders' Exchange of this city has determined to be fully represented, and with that determination has appointed a committee to make the necessary arrangements.

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

We continue our report from the last issue :

In Section VIII., on Friday, the 12th inst., Professor E. J. James, of the University of Pennsylvania, read a paper entitled "The Testimony of Statistics to our National Progress," in which he sought to prove that recent articles by Mr. Edward Atkinson, of Boston, were too optimistic in their view of the situation and prospects of the laboring man in America. "The Rate of Interest Realized to Investors on the Bonded Securities of the Government" was the title of a paper by E. B. Elliot, of Washington.

In Section A, Alexander Macfarlane read two papers on the "Logical Form of Geometrical Theorems"; J. Burkitt Webb discussed the "Moment of Inertia"; T. C. Mendenhall read a paper on "The Eccentricities of Guessing"; "The Orbit of Hyperion" was the title of a paper by Ormond Stone; Dr. R. S. Woodward read a paper on "A Method of Computing the Secular Contraction of the Earth," and Henry M. Parkhurst discussed "The Photographic Observation of Asteroids."

In Section B, Professor J. Burkitt Webb, of Cornell University, read a paper on "A New Dynamo Metre"; a paper on "The Electro-Motive Force of Magnetization," by Professor E. L. Nichols and Professor W. S. Franklin, was followed by one on a "Description of a Combined Chronograph and Weight Motor," by Professor W. A. Rogers, of Waterville, Me.; Elias E. Ries, of Baltimore, then read a paper on "The Electric Current as a Means of increasing the Tractive Adhesion of Railway Motors and other Rolling Contacts"; Professor Rogers then read a "Description of a Combined Chronograph and Weight Motor," and the last paper of the morning was "Experimental Determination of Minimum Wind-Velocity in the Washington, O., Tornado," by Professor C. Leo Mees, of Athens, O.

The report of the Committee on "Uniform Methods of Stating the Results of Analyses of Mineral and Potable Waters" was presented in the Section of Chemistry. Professor W. H. Herrick read a paper on "Improvement in Standard for Electrolysis," which was followed by one by Professor W. O. Atwater, of Middletown, Conn., on "The Determination of Nitrogen by Soda-Lime." "A Note on the Chemistry of Germination" was read by Professor William McMurtre, of the University of Illinois. The other papers of the morning were: "Standardizing Hydrometers," by Professor F. G. Novy, of the University of Michigan; "Note on Absorption of Nitrogenous Nutrient by the Roots of Plants," by Professor McMurtre. In the evening a number of papers were read by Professor T. H. Norton, and one, written by Professor F. G. Novy, was read by Professor Prescott.

In the Section on Mechanical Science and Engineering, J. Burkitt Webb exhibited diagrams of a new steam-engine indicator. J. E. Dewnton talked about an improved arrangement of Siemens' platinum electrical pyrometer. T. C. Mendenhall and John Mack lectured on the "Uniformity of Planimeter Measurements." H. T. Eddy talked about "Reaction Polygons and their Properties."

In Section E, Geology and Geography, the day was devoted to a consideration and discussion of the report of the American Committee of the International Congress of Geologists. The report consisted of digests of the reports prepared by the several reporters appointed by the committee and intended to reflect the opinion of American geologists on the various subjects touched. The report was presented by its Secretary, Dr. Persifor Frazer, of Philadelphia.

In Section H, Professor Thomas Wilson, of Washington, read an interesting paper on the "History and Present Condition of Prehistoric Archaeology in Western Europe." This was followed by an interesting paper on "Relics of an Indian Hunting Ground," by Professor A. Wanner, of York, Pa. Dr. George F. Kunz read a paper on "A Gigantic Jadeite Votive Adze from Oaxaca, Mexico." Dr. Kunz also exhibited a remarkable crystal skull, and read a paper upon it. The evening was devoted to "The Assumed Mythical Character of Professor Heer's Atlantis Theory," by Professor J. Kost.

In the evening the Torrey Botanical Club gave a reception to the botanists of the association.

Saturday was given up to excursions to West Point and Long Branch.

On Monday several papers of particular interest to our readers were presented. Four papers were read on canals across the American isthmuses. Commander Taylor, U. S. N., discussing the general question of "Isthmian

Transit," concluded that the Panama Canal had proved a hopeless failure. He considered that a ship-railway across the Isthmus of Tehuantepec must also fail, and that the proper scheme was a canal across the Isthmus of Nicaragua. R. E. Peary, C. E., U. S. N., discussed the Nicaragua route in detail, and the surveys and plans of Engineer Menocal, U. S. N. Mr. Peary estimated the cost at \$64,043,699, and the time of construction at six years. Dr. J. F. Bransford, U. S. N., read a paper entitled "Climatic and Sanitary Notes on the Nicaragua Canal Route," giving an almost enthusiastic view of its health, and food and water-supplies. J. W. Miller discussed Nicaragua Lake as a harbor, and also gave a highly favorable opinion of the Isthmus as a canal route.

Professor George F. Barker read a paper by Thomas Edison on "A Machine for Producing Electricity Directly from Fuel," called the pyromagnetic dynamo; also a paper by the same author on "A Magnetic Bridge or Balance for Measuring Magnetic Conductivity." The following papers were also heard: "The Simultaneous Measurement of the Speed of an Engine and Dynamo by Electric Means," by Professor H. S. Carhart, of Ann Arbor, Mich.; "The Electrical Condition of the Atmosphere in Fair Weather and During Thunder Storms," by Professor T. C. Mendenhall and Professor A. L. McRae, of Terre Haute, Ind. Vice-President Anthony then closed the morning session of the section. "Time of Exposure and Mass Considered as Functions of the Rate of Saturation of Heat in the Case of Mercury and Water," by Professor W. A. Rogers, of Waterville, Me., and the "Definition of the Ohm by the Equation $R = K \cdot c \cdot s$," also by Professor Rogers; "A Peculiar Form of Undulatory Current Suited to Telegraphing or Telephone Circuits," by Professor P. H. Van der Weyde, of the New York Medical College; "Some Notes on Standard Cells," by Professor H. S. Carhart; "Certain Phenomena Produced by the Explosion of Gun Cotton on Metallic Plates," by Professor C. E. Monroe, of Newport, R. I.; "Experiments on the Viscosity of Oil," by Professor J. B. Webb; "Is Terrestrial Magnetism Concerned in Atmospheric Movements?" by Professor M. A. Veder, of Lyons, Wayne County, N. Y.; and "A Classification of the Winds," by Professor W. M. Davis.

On Tuesday several excursions were made and officers elected as follows:

President, Major J. W. Powell, United States Army, Washington; vice-presidents, by sections—Mathematics and Astronomy, Professor Ormond Stone, of the University of Virginia; Physics, Professor A. A. Michelson, of Cleveland, Ohio; Chemistry, Professor C. E. Monroe, of the United States Navy, Newport, R. I.; Mechanical Science, Professor C. W. Woodward, of the Washington University, St. Louis; Geology and Geography, Professor G. H. Cook, New Brunswick, N. J.; Biology, Professor C. V. Riley, Washington; Anthropology, Professor Charles C. Abbott, Trenton, N. J.; Economic Science and Statistics, Professor C. W. Smiley, Washington; permanent secretary, Professor F. W. Putnam, Cambridge; general secretary, Professor J. C. Arthur, Lafayette, Ind.; secretary of the council, Professor C. Leo Mees, Athens, Ohio; treasurer, William Lilly, Mauth Chunk; secretaries of sections in order, Professor C. L. Doolittle, Bethlehem, Pa.; Dr. A. L. Kimbal, Johns Hopkins University; Professor W. L. Dudley, Nashville; Professor George H. Williams, Johns Hopkins University; Professor Arthur Beardsley, Swarthmore College; Dr. N. L. Britton, Columbia College; Professor Frank Baker, Smithsonian Institute, and Professor Charles S. Hill, Washington. The next meeting will be held at Cleveland, beginning the fourth Wednesday in August, 1888.

The last session was held Tuesday evening. Votes of thanks to Columbia College and its president, to the various committees, and the ladies which have entertained the members were passed, and "Eli Perkins" provoked a laugh by a humorous address on "The Philosophy of Wit, Humor, and Satire."

DISINFECTANT FOR STREET EXCAVATIONS.

PARK COMMISSIONER JOHN D. CRIMMINS asked the New York Health Board for advice about the work of disinfecting the excavations for the electrical subways. After experiments by Dr. Edson and Dr. Martin, President Bayles sent the following letter to Contractor Crimmins:

"SIR: In reply to your valued favor of the 10th instant, asking the advice of the Department as to a disinfectant to be used along the line of the subway excavations, I have the honor to say that experiments conducted by the officers and chemists of the board during the past few days lead to the conclusion that the best material for your use is a solution of bromine in water. We have tested this solution on earth taken from the subway trench at Broadway and Twenty-seventh Street, and find it prompt and effective in action, especially in the presence of coal-gas and the products of its condensation. A pound of bromine in a barrel of water will give probably a solution of sufficient strength for your purpose. If you desire, we will prepare the solution in our laboratory, as it requires special skill in handling, and supply it to you at net cost, which will be not far from \$1 a barrel, enough, if our experiments can be accepted as conclusive, to render 200 feet of trench free from nuisance. One of our inspectors will be detailed to instruct in the economical use of the solution any person whom you may designate.

"With much respect, J. C. BAYLES."

ENGINEERS' CLUB OF KANSAS CITY.

IN place of the regular meeting of August 1, the club took an excursion to Sibley July 30, where the Chicago, Santa Fe and San Francisco Railway is to cross the Missouri, by invitation of Mr. Octave Chanute, Consulting Engineer of the works. There were, including ladies and other invited guests, fifty-two in the party.

Leaving the Kansas City Union Depot in a special car at 10:45 A. M. by the Wabash road, the party was joined at the junction with the bridge switch by Mr. I. F. Wallace, Resident Engineer at the bridge, who conducted the visitors to the scene of operations.

After examining the plans and materials, and the arrangements for prosecuting the work, they repaired to the private chair car, where they were served a bounteous and excellent lunch. Subsequently a few of the more adventurous men of the party descended into the caissons, from which they emerged a few moments later drenched and almost exhausted. They declared that the temperature of the outside atmosphere at 97° was wintry in comparison with the temperature (110°) which they experienced during their short stay in the caissons.

In the afternoon the guests were conducted aboard the contractor's steamboat by Mr. SooySmith, and took a short trip on the river.

They returned by special train to the Union Depot at 7:45 in the evening.

A vote of thanks was tendered to Messrs. Octave Chanute, I. F. Wallace, Charles SooySmith, and the Wabash Railway Company.

AMERICAN SOCIAL SCIENCE ASSOCIATION.

THE general meeting of this association for 1887 will be held at Saratoga, N. Y., from the 5th to the 10th of September, inclusive, opening at 8 P. M., September 5, with an address by the President, Carroll D. Wright, of Boston. The Department of Education will meet on Tuesday, September 6; the Health Department on Wednesday, September 7; the Department of Jurisprudence on Thursday, September 8; and the Social Economy Department on Friday, September 9.

THE laying of the intake-pipe for the Racine, Wis., Water-Works has just been completed. This involved the laying of 1½ miles of 24-inch iron pipe at an average depth of ten feet below the lake bottom. The contractors are Thatcher & Breyman; the dredging of the trench for the pipe was done by Starke Bros. Thatcher & Breyman are now laying 2,000 feet of pipe below river and lake for Sheboygan, Wis. The test of the Racine Water-Works will be made this week or next.

PERSONAL.

MAJOR JARED A. SMITH, U. S. Engineers, has been ordered to Fort Constitution and Jerry Point, N. H.

CHIEF NAVAL CONSTRUCTOR WILSON, U. S. N., has been ordered to inspect the Navy Yard at Portsmouth, N. H., also at Mare Island, Cal.

MR. STEVENSON TOWLE, ex-Chief Engineer of Sewers, Department of Public Works, will sail soon for Europe, to examine the systems of drainage and sewage disposal recently constructed there.

THE Secretary of the Navy has appointed a board of naval officers to examine the plans submitted by the Barrow Shipbuilding Company, of London, for an armored battle ship, and report on the probable cost of building the vessel. The members of the board: are Chief Constructor T. D. Wilson, President; Engineer-in-Chief George W. Melville, Captain George Brown, Assistant Naval Constructor Francis T. Bowles, and Assistant Naval Constructor Lewis Nixon.

DR. H. V. FERREL, of Williamson County, has been appointed a member of the State Board of Health of Illinois.

JAMES TAYLOR, who founded the Trenton, N. J., Pottery, died in that city, August 17, aged seventy-eight years.

SIR ROBERT RAWLINSON, C. B., has placed funds at the disposal of the Association of Sanitary Engineers and Surveyors to enable them to appoint a person to work up all the information accessible on the subject of "sewer ventilation."

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

DESIGNS FOR SOLDIERS' AND SAILORS' MEMORIAL.—The Commissioners for the State of Indiana will receive designs in competition for the Soldiers' and Sailors' Memorial and Monument at Indianapolis. The cost will be about \$200,000. The plans will be submitted to a board of experts for examination. They should be sent before December 12 to George J. Langdale, President of the Commission.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE SANITARY ENGINEER AND CONSTRUCTION RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

For works for which proposals are requested, see also the "Proposal Column," pages 372-376.

WATER, SEWERAGE, ETC.

PAWNEE CITY, NEB.—Will vote on bonds for water-works, \$28,300, September 12. A. A. Richardson is the engineer. Mr. Richardson's plans include a pumping-engine, stand-pipe, and 20,000 feet of water-pipe.

LA GRANGE, GEO.—Public sentiment here was so much against water-works that the town did not hold the election.

LOWELL, MICH.—We learn that water-works are to be built by the Lowell Water Co. The water is procured from wells. There is a reservoir and 150 feet fall; cost, about \$25,000, with 50 fire-hydrants. The works will be completed about December 1.

BUTLER, MO.—Our correspondent writes: "In reply to your inquiry I will state that we have taken no steps to establish water-works, but we intend to let a franchise to some company just as soon as we can get a reliable proposition that we can stand."

WILTON, IOWA.—"There has been nothing decided on in regard to water-works, but there has been a company formed for the purpose of drilling a hole 2,000 feet deep to see what can be developed in the way of coal, gas, or an artesian well. They are very confident that they will strike water, and if they get nothing else I suppose they will form a water-works company."—W. D. H.

OSCEOLA, MO.—Our correspondent writes: "The water-works question for Osceola has been indefinitely postponed. We found it would cost too much considering the population of our town—1,500."

GREENVILLE, MICH.—The question of obtaining water-works will be put to a vote of the people in about a week.

WELLSTON, O.—Our correspondent writes: "No preparations have been made as yet for water-works, but we expect to contract for water-works within the next sixty days."

TORONTO, ONT.—The committee of experts have reported on means of increasing the water-supply. The schemes presented, on which they were asked to make a report, fix the cost all the way from \$29,000 to \$48,000. All provide for new pumping-engines. The committee is Alan McDougall, George C. Robb, John Galt, William Hamilton.

COLUMBUS, O.—Is agitating the construction of an intercepting sewer.

MANKATO, MINN.—The City Engineer will advertise for proposals on constructing a water-works reservoir at once.

MONTGOMERY, ALA.—Mr. George E. Ellis has declined to undertake surveys for a system of sewerage. The work will be done by City Engineer Williamson and assistants.

LAPER, MICH.—The water-works committee have reported to councils in favor of building water-works at an estimated cost of \$30,000 to \$40,000. The question will be submitted to the citizens at a special election.

FARMINGTON, ME.—The water company will put in a system of water-works, also of electric-lights.

FORT SMITH, ARK.—James P. Bales, C. E., has finished surveys for the construction of sewers on plans by J. W. Neir, C. E. The main will be 46 inches in diameter and 7,530 feet long.

KINSLEY, KAN.—Our correspondent writes: "Our city has voted bonds for \$40,000 for the construction of water-works. Bonds have been sold and engineer is now working on plans and specifications which will probably be completed this week, when bids will be advertised for. We shall use the stand-pipe system and will lay about 4½ miles of main."

ATHOL, MASS.—Town-meeting August 12 voted to introduce a sewerage system and appropriated \$10,000 to begin work at once. In charge of the matter are Selectmen W. W. Fish, J. W. Goodman and J. F. Whitcomb.

SALT LAKE CITY, UTAH.—The construction of a reservoir in City Creek Canyon is agitated.

BURNET, TEX.—A contract has been made here for sinking an artesian well.

SHEBOYGAN FALLS, WIS.—proposes to build water-works.

READING, PA.—City Council has before it a letter from W. M. Griscom, of Berlin, on the subject of filtering the water-supply.

RUSHVILLE, IND.—An agitation has begun for obtaining a water-supply.

BOOTH BAY, ME.—wants water, and several parties have looked over the contract, but nothing definite has been done.

DETROIT, MICH.—Large quantities of new iron pipe has been ordered laid by the Water Board.

AUBURN, CAL.—will have a water-supply from Bear River ditch.

HALLOWELL, ME.—The Hallowell Water Company will build a reservoir near the city farm that will furnish a much larger and better supply than heretofore.

COLDWATER, MICH.—will vote September 1 on the question of water-works. The estimated cost is \$60,000.

WASHINGTON, D. C.—It is proposed to cut an artificial channel around the new reservoirs to carry flood-waters past them into the Potomac River, and prevent fouling of the reservoirs. The cost is estimated at \$130,000.

JERSEY CITY, N. J.—Contractor Fox has offered to sell to Jersey City all the title and interest in the works known as the Kearney Avenue Water-Main, including pipe, branches, gates, bridges, etc., connected therewith, for the sum of \$50,000. The contract price is \$61,861.20.

NICKERSON, KAN.—has voted \$32,000 for water-works.

GIRARD, KAN.—Incorporated is the Girard Water-Works Company by C. G. Hawley and others.

TITUSVILLE, FLA.—Address the Mayor for particulars about proposals to be advertised for water-works.

SANFORD, ME.—The Sanford Electric-Lighting Company has increased its capital, and will introduce water-works.

LAMAR, MO.—Francis Tiernan & Co. offer to take the stock and assume the debts of the Lamar Water and Gas Company, provided the city will take water from sixty hydrants, at \$60 per hydrant per annum.

LAKE, ILL.—The Trustees anticipate taking early action in the direction of increasing the water-supply. Several plans are being considered. The one which will probably be acted on is to construct a tunnel seven feet in diameter, leading from the shore-shaft to works at Fifty-ninth and Halsted Streets. It is estimated that the work could not be completed in less than two years. J. Frank Foster has been designated to make a preliminary examination.

MARIETTA, O.—has before its Council propositions for building water-works. The American Water-Works Company, of McKeesport, Pa., proposes to put down ten miles of pipe from 16 to 4 inches, put in a reservoir of not less than one and a half million gallons capacity; put in two pumps of three millions of gallons capacity in the twenty-four hours, and furnish the city with 120 fire-hydrants, at an annual rental of \$4,300, giving the city the right to purchase at intervals of five years. New York parties, represented by T. D. Dale, of Marietta, propose to put in ten and one-half miles of pipe, from 16 to 4 inches; duplex engines and pumps of two and a half millions of gallons capacity in twenty-four hours, a stand-pipe for reserve use of three hundred thousand gallons capacity; take the water from wells sunk at the edge of the river, furnish 75 fire-hydrants for \$1,750 annual rental, and furnish 50 additional fire-hydrants at \$500 annually. E. R. Davenport, of Charleston, W. Va., proposes to lay eleven miles of pipe, put in two engines, boilers, and pumps, the pumps to be of three million gallons capacity in twenty-four hours, filter the water, supply it by direct pressure and reservoir through the pipes; extend surface pipes for consumers to the curb stone, put in 125 fire-hydrants at an annual rental to the city of \$1,500.

ROCHESTER, N. Y.—Emil Kuichling will make surveys for a trunk sewer on the East Side; \$21,000 appropriated.

ROCHESTER, N. Y.—\$38,000 are to be expended on new water-mains. Address the Water-Works Committee of City Council.

SOUTHERIDGE, MASS.—has a Committee on Sewerage.

TARRYTOWN, N. Y.—On August 15 it was voted to raise \$100,000 for increasing the water-supply.

CLEVELAND, O.—An ordinance is under consideration making the City Civil Engineer, the Water-Works Engineer, the City Solicitor, and two citizens a Commission to prepare plans to prevent the sewage pollution of the Cuyahoga River, with an estimate of the cost of the necessary works.

Later.—The Commission has been appointed as follows: City Civil Engineer Rice; Water-Works Engineer Whitelaw; City Solicitor Brinsmade, and two citizens to be named hereafter.

AUSTIN, ILL.—A report has been received from the Special Water-Committee on a water-supply, on the cost of connecting with Chicago's mains. Their estimate was \$69,600. An estimate for pumping-engines and stand-pipe, not including water-mains, was presented at \$10,000. "Well men" are asked to submit propositions.

PROVIDENCE, R. I.—The contract for a 25,000,000-gallon reservoir on Fruit Hill has been given by the Board of Public Works to J. J. Neuman, of Providence, the lowest bidder.

GILROY, CAL.—A canal is to be dug from Frazier Lake, Old Gilroy, to the Pajaro River. This canal will drain and reclaim for pasture and cultivation about 2,000 acres of land.

MANCHESTER, VA.—John E. Taylor, Mayor, informs us that the City Council is entertaining propositions

in regard to water-supply and are "open for proposals." "Parties looking for conservative investment, I think, might find a first-rate chance here, as the surroundings are inviting for the building and operating of works." Address the Mayor for details.

POCAHONTAS, VA.—Our correspondent writes in reference to proposed water-works here: "We are not able to do anything about water-works now. It may be that the citizens would patronize any one who would come here and put up works at their own expense. It seems to me that a stock company might make money out of it."

JACKSON, MICH.—will obtain a supply of water from an artesian well—1,000,000 gallons daily.

MONTREAL, CAN.—We recently published the bids for furnishing pumping engines for the water-works. The City Council, August 15, awarded the contract, for local reasons, to E. E. Gilbert, of Montreal.

KINGSTON, JAMAICA.—Colonel George E. Waring's report on the sewerage of Kingston, recently sent to Mayor and Council, proposes the separate system with flush-tanks, and an outfall so situated as to be convenient to a sewage-farm should that hereafter be used. The main sewer varies from 12 to 18 inches in diameter, with 6-inch laterals and 4-inch private connections. The estimate of cost is £27,992 (about \$135,000.)

COLORADO SPRINGS, COL.—H. C. Lowrie, C. E., of Denver, will make an estimate and report to Council on the cost of water-works.

Mt. CLEMENS, MICH.—The Mt. Clemens Water-Supply Company has been incorporated by F. G. Kendrick, W. J. Daley, and others.

TOPEKA, KAN.—Incorporated is the Topeka Land and Water Power Company; William Tweddle, J. M. Currier, and others.

AUSTIN, MINN.—The National Iron and Brass Works, of Dubuque, Iowa, has been awarded contract for water-works system at \$36,000.

MALDEN, MASS.—The Aldermen have appropriated \$5,000 to the making of experiments with driven wells.

ANTWERP, N. Y.—Address G. H. Heywood regarding water-works.

TIPTON, IOWA.—is agitating obtaining artesian wells as a source of water-supply.

NEWARK, N. J.—Incorporated is the Southern Gas Trust and Construction Company; Frank P. Mercereau and Harry G. Payne, of Pulaski, Fla., and John M. Dow, of Newark. The capital is \$100,000, and business is to be begun on \$25,000. The business is to be the construction and running of gas and water-works in Newark and various places in Florida.

CARPENTERIA, CAL.—Mr. Hogue will furnish a water-supply from artesian wells.

JAMESTOWN, N. Y.—The water company is prospecting for new sources of supply and test wells will be sunk in the Levant.

MILWAUKEE, WIS.—Common Council Committee has reported favoring an appropriation of \$17,000 to begun work on the flushing tunnel.

PORT FULTON, IND.—The Trustees have granted permission to the Water-Works Company to lay water-mains.

JEFFERSONVILLE, IND.—Plans and surveys for the water-works are finished and work will soon be begun.

FREDERICK, MD.—Our correspondent writes: "In seasons of great drought our city's present water-supply, derived principally from a stream called the 'Big Tuscaraora,' situated about six miles west of Frederick, is hardly adequate to the wants of the city, and our authorities consequently have taken some action looking toward an increased supply. This can probably be had from another stream lying between Frederick and the stream of present supply. However, surveys are likely to be made of other streams lying farther away of greater capacity. I am uncertain whether it is the design of our Board of Aldermen to push this matter right along now or only to acquire the necessary facts as to cost, etc., for use in the near future."

GAS, STEAM, BUILDINGS, ETC.

ROCHESTER, MINN.—Walker, O'Mulcahy & Henessey have been granted a twenty years' franchise to manufacture gas here. The work will begin soon. The price of gas must not exceed \$2 per 1,000 feet.

STILLWATER, MINN.—The Excelsior Electric-Light Company and the Stillwater Gas Company have consolidated.

DULUTH.—The electric-light company has increased its capital stock to \$50,000. A new building to cost \$5,000 will be put up. The plant will be increased to 175 2,000-candle-power lights; a new 150-horse-power Corliss engine will be put in, and two new dynamos added. A \$20,000 addition to the City Hotel will be built.

F. A. SAWYER, of Portland, and others have bought the Biddeford, Me., and Saco Company's gas-plant.

GOVERNMENT, N. Y.—An electric-light company has been formed here with E. D. Harry, President, W. F. Ludds, Vice-President; C. Arthur Parker, Secretary. The American arc-light will be used.

CHATTANOOGA, TENN.—Natural-gas is reported to be found at the Logan well. The well is sunk by the Chattanooga Oil and Gas Company; George McGranahan is engineer.

CHICAGO.—Parties interested in gas-works supplies should watch developments here. The Gas-Light and Coke Company will issue bonds to a very large amount, and apply the proceeds to large extensions of the plant.

COLUMBUS, O.—The gas company has taken measures to supply gas for heating.

LEWISTON, ME.—A Committee of Council has been appointed to obtain propositions for lighting the streets with arc-lights.

BRIDGEPORT.—The Aldermen here voted to contract with the Bridgeport Electric-Light Company for five years for electric-lights on the following basis: Lights to burn all night; fifty-three cents per lamp per night if contract is made for three years, and fifty cents if for five years. The latter proposition is accepted.

KENSINGTON, ILL.—Incorporated is the Kensington Electric-Light Company of Kensington; capital, \$20,000; incorporators, Burt Williams, James O'Brien, William Birdsall, Erastus Gates, and John Heaton.

COLUMBUS, MISS.—The gas-works will be enlarged. T. Byron is Superintendent.

TUSCALOOSA, ALA.—Gas-works will be built here by the Tuscaloosa Coal, Iron, and Land Company.

OWENSBORO, KY.—H. D. Fitch, of Louisville, will rebuild the gas-works here. About \$60,000 will be expended.

CHICAGO.—Capitalists have undertaken a search for natural-gas in this vicinity. Joseph Oaks and J. J. Dugan, of Indiana Avenue, are experts in the matter.

PHILADELPHIA.—A charter has been granted to the Steam-Heating Company, of Philadelphia; capital, \$400,000.

ST. PAUL.—Incorporated is the Duluth Natural-Gas, Oil and Mineral Company. Capital stock, \$100,000. Incorporators: W. A. Foote, J. D. Ray, J. R. Carey, L. Mendenhall, J. H. Triggs, N. J. Miller, S. E. Cheeseman.

ALBERT LEA, MINN.—A company with a capital stock of \$150,000 has been organized to be known as the Minnesota Natural-Gas and Fuel Company.

EASTON, PA.—The Easton Market Company intends to heat its building with steam. The building is not under roof yet. Any one addressing to D. W. Neven, Easton, Pa., will get all information desired.

ST. PAUL, MINN.—Incorporated is the Minnesota Oil Company; capital stock, \$250,000. The object of the company is to mine and bore for gas, oil, salt, and other mineral substances in Wyoming County, N. Y. The incorporators are W. H. Jennings, Walter Alexander, A. D. Stephens, T. J. Thorson, M. Scheller, H. A. Mason, and W. T. Zwickley, of Crookston; A. E. Johnson, of St. Paul, and C. A. Chiniuvy, of Chicago.

SACO, ME.—F. A. Sawyer, of Portland, Col. Steadman, of New York, with Horace Woodman, of this place, have negotiated for the purchase of the Biddeford and Saco Gas Company's plant, the money to be paid and the subscribers to take possession October 1. It is understood that the purchase is made for the Traders' Electric-Light Co., of Biddeford.

COLUMBIA, PA.—The town has contracted with the Columbia Electric-Light Company to furnish electric-lamps for street-lighting for one year.

LEWISTON, ME.—The city government has passed an order looking to the establishment of an electric-light plant for lighting the city.

BROOKLYN.—Samuel H. Hoffman, of St. Louis, is the lowest bidder for mason-work on the new Amphion Academy on Bedford Avenue, and he has the contract. The heating and ventilation has been given to R. A. Goodchild, for the Hankins heating and ventilating system.

RAILROADS, BRIDGES, CANALS.

ST. PAUL.—The Minnesota Railway and Navigation Company has filed articles of incorporation with the Secretary of State. The project has already been referred to in these columns. The capital stock is \$10,000,000. The incorporators are Ansel Oppenheim, W. H. Knowlton, Mark D. Flower, C. W. Bunn, John I. Thompson, William Dawson, Jr., F. W. Davis, Arnold Kalman, and R. C. Wright, all of St. Paul. The object is the building of a line of road from St. Paul and Minneapolis to a point on Lake Superior.

AUSTIN, MINN.—County Commissioners have let contract for three iron bridges to N. E. Horton, Rochester, Minn., \$7,574.

MEMPHIS, TENN.—The charter for the Jackson Mound Park Railroad Company has been filed. The following gentlemen are the incorporators: A. Vaccaro, E. L. Golbaum, Joe Mancini, Sol Coleman, John W. Cochran, D. Zellner, B. M. Stratton, C. W. Schulte, Holmes Cummings, and Theodore Kregel.

BIRMINGHAM, ALA.—The stockholders of the Birmingham and Northwestern Railroad have met and organized a company by the election of the following officers: T. M. R. Tacon, of Mobile, president; H. Tacon, of Mobile, secretary and treasurer; William Inge, of Corinth, Miss., general counselor, and a board of directors. A large corps of surveyors are in the field now and it is given out that the building of the road will be pushed as early as possible.

DECATUR, ILL.—The directors of the Louisville and Nashville Railroad have decided to erect their shops here at once. They will consolidate all their locomotive-works and car-building shops into one immense concern.

CANALS.—Surveys for the American canals are being made by Mr. J. Page, Chief Engineer of the Department of Railways and Canals of Canada.

TENNESSEE RAILROADS.—A corps of engineers has begun work on the survey of the Nashville and Tuscaloosa Railroad. The road is in operation twenty miles south-west from Centerville to Etowah.

The engineering corps of the Tennessee Midland Railroad will this week begin the survey of a new route from the Cincinnati Southern Railroad to the Virginia line.

The Paducah and Tennessee Railroad Company has been organized in Paris, Henry County. R. L. Ellison is President, T. H. Puricar, Vice-President, and J. L. Lemonds, Secretary and Treasurer.

LOUISVILLE, KY.—The Louisville and Jeffersonville Bridge Company have ordered the engineer to make surveys for a bridge over the river.

BATH, ME.—The City Council have contracted with the Bath Electric Power Co., to light the streets with 20-arc lamps, each 10,000 candle-power, for \$2,000 per year, to be running by the middle of October.

MEMPHIS, TENN.—The Chesapeake, Ohio and Western Railway will build a depot to cost about \$600,000. The contract has been let.

NEW BRUNSWICK, ME.—The survey has been made for the New Brunswick Railway, through Houlton to Titcomb's mill.

LAFAYETTE, TEX.—The contracts for the construction of the Mexican National Railroad were signed August 11 with Hampson & Thornton. They agree, according to the terms of the contracts, to complete the work within one year and are to break dirt within ten days.

CHATTANOOGA, TENN.—A contract for the construction of the Chattanooga, Rome and Columbus Railroad has been awarded and work begun. This road is a new line, extending south from Chattanooga to Columbus, Ga., a distance of 230 miles, and is to be completed within eleven months.

WOONSOCKET, R. I.—The Town Council has voted to accept the report of the committee recommending that a bridge be built over the Blackstone River after plans by William Kent, C. E. The cost of bridge and approaches is estimated at \$22,000.

TAUNTON, MASS.—The Pennsylvania Bridge Company has the contract for building an iron bridge over the river at the pumping-station. The price was \$4,635.

LINCOLN, NEB.—Bonds have been voted to the Salina, Lincoln and Pacific Railroad, in Glendale and Pleasant Valley townships, Salina County. This completes the franchise from Salina to Lincoln, and insures the building of this road by the Rock Island.

PHILADELPHIA, PA.—Charters have been granted to the Susquehanna Building and Loan Association, No. 2, of Philadelphia, capital \$1,000,000, and to the Norristown Land and Improvement Company, capital \$100,000.

NEW BRUNSWICK, N. J.—The Board of Aldermen have received a favorable report from the committee appointed to investigate the Vanderpool electric system of street road lighting, and a resolution was framed giving the City Railroad Company the right to erect poles along its route, provided no opposition was encountered from property-owners.

MEMPHIS, TENN.—Contracts for the grading for that part of the Tennessee Midland Railway between Memphis and the Tennessee River, a distance of 135 miles, were awarded July 27 to the following parties: Robert Johnson, Memphis, Tenn., 10 miles; Cook & Gaines, Princeton, Ky., 10 miles; McGowan & Brown, Holly Springs, Miss., 11 miles; W. Ferguson & Co., Danville, Tenn., 10 miles; H. C. Tate & Co., Memphis, Tenn., 13 miles; J. S. McTigue & Co., Memphis, Tenn., 50 miles; Finlay & Clayton, Tupelo, Miss., 12 miles; John L. Wisdom & Co., Jackson, Tenn., 10 miles. For freighting and piling, to Cook & Gaines, Princeton, Ky.; F. L. & C. J. Houser, Gadsden, Ala.; R. D. Lawrence, Aberdeen, Miss. For cross-ties to D. H. Pitts & Co., Scottsville, Va.; Brittain, Pearce & Co., Jackson, Tenn.; and D. H. Pitts & Co., Scottsville, Va.

EASTON, PA.—The American Pneumatic Railway Company, of Philadelphia, proposes to build a line here, one mile long.

TOPEKA, KAN.—Articles of incorporation of the Chicago, St. Paul and Kansas City road were filed in the office of the Secretary of State August 1. The term of existence of the corporation is ninety-nine years, and the capital stock is \$15,000,000. The first board of directors will be composed of E. W. Pierce, St. Louis; Edward R. Rose, J. F. Harris, C. F. Hamilton, M. C. Hage, and G. H. Gerber, Salina, Kan.; and F. Allen, Deltor, Mo. The object is to construct a railroad as follows: Main line to run from a point on the north line of the Naugas, on the north line of Washington or Republic County to a point on the south line of Barber County and west line of Meade County. The length of the main line is 350 miles. Three branches are also to be constructed, two of them 200 miles long and one 250 miles.

ROME, GEO.—The Rome Land Company wants dummy-engines for the street-car line.

NEW YORK CITY.—The Martin Anti-fire Car-Heater Company, of Dunkirk, N. Y., has signed a contract to place in the cars of the New York Central and Hudson River Railroad their system of car-heating. The contract will involve an expenditure by the Central of over \$600,000.

MARINETTE, WIS.—has voted to build a bridge over the Menomonee River, at a cost of \$50,000.

SAN DIEGO, CAL.—The San Diego and International Railroad Company has filed articles of incorporation to build a five-mile steam railroad, telegraph and telephone line from the head of San Diego Bay to the north boundary-line of Mexico. The incorporators and trustees of the company are Charles F. Francisco, Riley R. Morrison, David Gochenauer, William Gardner, and G. Y. Gray. The capital stock is \$150,000, divided into 1,500 shares.

KEENE, N. H.—The Keene Street Railway Company organized August 10 with the Hon. A. T. Batchelder, President; the Hon. Charles H. Henry, Clerk; William B. Fink, Treasurer; directors, C. J. Woodward, John S. Blodgett, Andrew H. Hayes, Charles R. Corning. It is proposed to build the road at once.

BOSTON.—By a vote of the directors of the Consolidated Street Railway Company all the horse-car lines in Boston are placed under one management. The consolidation is the last of a series, and it now controls many miles of road.

NEWARK, N. J.—The Newark and Irvington Cable Street Railway Company have received permission to lay the cables and will proceed with the work.

BROOKLYN and Jamaica Plank Road Railroad Company has contracted with the Vandepole Electric Manufacturing Company to construct an electric railway.

DENVER, COL.—Address the City Engineer in regard to a \$35,000 bridge to be built on Nineteenth Street.

ROME, GEO.—W. G. Gamma, Chairman of Committee of Roads and Revenue, should be addressed in regard to two bridges at this place.

SAN FRANCISCO, CAL.—Articles of incorporation of the Winters and Ukiah Railroad Company have been filed in the County Clerk's office. The road is to com-

mence in Yolo County, running northwesterly up Berryessa Valley to Clear Lake and thence to Ukiah. The length is 105 miles. The directors are Charles F. Crocker, Timothy Hopkins, W. V. Huntington, S. F. Gage, and N. T. Smith; capital stock, \$4,000,000.

BRIDGE.—The Penn Bridge Company, of Beaver Falls, Pa., has been chartered with a capital of \$50,000.

ROCHESTER, N. Y.—City Surveyor Quinn is preparing specifications for an iron bridge over the river at the Driving Park; estimated cost, \$75,000.

DULUTH.—A belt and terminal railway company will be organized with the following incorporators: William F. Phelps, Secretary of Chamber of Commerce; Mayor J. B. Sathp'n, J. D. Ensign, R. S. Munger, M. R. Baldwin, Colonel C. H. Grove, L. Mendenhall, Asa Daily, W. W. Wilson, J. J. Ray, J. R. Myers, G. G. Hartley, and M. B. Harrison.

JAMESTOWN, DAK.—The contract for a 12-stall addition to the Northern Pacific Railway round house has been let to contractor Bjourquist, of Moorehead, for about \$17,000.

MILWAUKEE.—Adolph Toellner and others are experimenting on State Street with an electric motor for street railways. If successful, a franchise will be granted to them. Wires are strung on both rails and eight miles an hour up the hill on Seventh Street will be made.

The Hinsey ordinance provides for a street railway in Milwaukee on Broadway from Wisconsin to Oneida, thence to Sixth Street, thence to Centre and West to city limits.

KANSAS CITY, MO.—The Kansas City and Sabine Pass Railway Company has filed articles of incorporation and received a charter for the State of Missouri, with a capital of \$2,500,000. Col. Harrison M. James, of New York, is President and Fred M. Day, of Brooklyn, Treasurer. The object is to build an air-line road from Kansas City to Sabine Pass, 700 miles.

ST. LOUIS, MO.—Morrison & Corthell, of Chicago, are making plans for the new bridge over the Mississippi River.

AUGUSTA, GEO.—The Augusta Construction Company has been organized to build the Augusta and Chattanooga Railroad. J. P. Verdery, W. B. Lowe, W. M. Bird, J. P. Bondurant, and others, of Augusta, are members of the company.

STREET WORK AND PAVING.

ST. PAUL.—The Board of Public Works have confirmed assessments for paving as follows:

Rosabel, from Eighth to Tenth; Eighth, from Locust to Wabash; Fillmore Avenue, from Dakota Avenue to State; street next to the Mississippi River, from Chestnut to James.

The board has advertised for bids for the improvement of Summit Avenue, from Lexington Avenue to the edge of the bluff near the Mississippi. The following is an approximate estimate of the work to be done:

Excavation, 235,000 cubic yards; embankment, including surfacing for roadways, 100,500 cubic yards; soil filling for boulevards, 39,760 cubic yards; timber, 40,000 feet; stone gutter, 1,935 square yards; slope wall, 100 cubic yards.

MORRISTOWN, PA.—It is proposed to lay out a new street from Sandy Hill to Main Street. A large amount of stone wall will have to be built. The matter is in charge of the Town Council Committee on Streets, Roads and Bridges.

HARRISBURG, PA.—Howell & Gruber, of Lancaster, have received the contract for furnishing and putting in place 4,200 feet of granite curbing on Market Street.

FREEPORT, ILL.—Incorporated is the Taylor Park Company; John B. Taylor, Joseph S. Buck, Edward C. Warner.

SAN ANTONIO, TEX.—Address the City Engineer in regard to the proposed improvement of Cameron Street.

BIDS OPENED.

BOSTON, MASS., August 12 (Special).—The only proposal received to-day by the Park Commissioners for a bridge on the Agassiz Road, Back Bay Park, was from Thomas A. Rowe, whose bid was \$34,814. The contract will probably be advertised again.

CAMDEN, N. J.—Council Committee has opened bids and awarded contracts as follows on street work: Filling Kaiga Avenue to Cooper's Creek, Frank C. Somers, \$4,500; estimated quantity, 25,000 cubic yards. Paving Koyden, Main, and Vine Streets, William H. Sherman, \$2.05 per square yard.

Paving Third Street, Aaron Ward, 72 cents per square yard; Garrett Miller, 69 cents; W. H. Sherman, 53 cents (awarded).

Building Line Street sewer, 5'x3'4", 16 feet excavation, William Thompson, \$8.25 per foot; W. B. Pine, \$7.97; Aaron Ward, \$7.61 (awarded).

Building an egg-shaped sewer on Liberty and Fourth Streets, equal to a 2-foot circular sewer, Aaron Ward, \$1.19 per foot; William Thompson, \$1.13; W. B. Pine, \$1.03 (awarded).

NASHVILLE, TENN.—The following bids for constructing a masonry reservoir (capacity 50,000,000 gallons) were received by the Board of Public Works and Affairs August 9:

Williams & Tolmie, Nashville, \$741,180.

W. B. Beach & Co., \$603,887.

Owen Patterson, Baltimore, Md., \$474,750.

Gilbert Patterson, Washington, D. C., \$438,910.

Smith, Leonard & Munford, Niagara Falls, N. Y., \$435,954.

Meyer & Alexander, Nashville, \$429,930.

Houston & Freeman, Glendale, O., \$400,955.

Southern Construction and Quarry Company, Nashville, \$359,272.

Hicks, Holmes & Co., Indianapolis, Ind., \$359,022.50.

Harold McDonald & Co., Pittsburg, \$352,302.60.

R. P. McClure, St. Louis, \$337,905.

Smith, Waters & Co., Baltimore, \$336,712.

Whitsit & Adams, Indianapolis, \$330,921.

The Board decided to award the contract to Whitsit & Adams, of Indianapolis. They guarantee to finish the reservoir within the next twenty to twenty-four months.

LITTLE ROCK, ARK.—Synopsis of bids for Sewer District No. 2, total length of sewer, 4,680 feet, F. J. Rickon, engineer to the board:

E. W. Weigel & Co., excavation and back filling, 20c. per foot; pipe laying, 12c. per foot; manholes, \$13 each; flush-tanks, \$60 each.

N. H. Wordswell, excavation, back filling, and pipe laying, 32c. per foot.

Thompson, excavation, back filling, and pipe laying, 32c. per foot.

G. R. C. Rumbaugh, to complete work, \$3,900.

The contract was let to E. W. Weigel & Company.

The Falls City Sewer Pipe and Terra Cotta Company, of Louisville, Ky., has the contract for furnishing the pipe, etc.

The system is small pipes and flush-tanks.

Bids for constructing the Harvard Bridge over the Charles River, between Boston and Cambridge, were opened August 15 by the Harvard Bridge Commissioners, as follows:

1. Dredging 5,000 cubic yards.....	\$4.40
2. Spruce piles, 2x4x10.....	4.50
3. Curbing, 1,800 lineal feet.....	7.25
4. Portland concrete, 2,670 cubic yards.....	5.00
5. Pier masonry, 3,710.....	17.76
6. Coping masonry, 554.....	21.00
Total.....	\$122,850.00
John Shields and John Carroll, Boston.	
Boynton Bros., Boston.	
Mt. Waldo Granite Works, Frankford, Me.	
Joseph H. White & Co., Boston.	
C. H. Edwards and G. H. Cavanagh, Boston.	
D. Connelly & Co., Boston.	
Trumbull, Cheney, Hayes & Co., Boston.	
William H. Ward, Lowell.	

The contract was awarded to Shields & Carroll.

CINCINNATI, O.—Bids for granite-paving, etc., on Eastern Avenue were opened by the Board of Public Affairs August 10. Estimate of quantities:

Curbs, 5-inch granite, 22,900 lineal feet; curbs, circular, 450 lineal feet; curb, reset, 4-inch granite, 200 lineal feet; curb, reset, 5-inch granite, 100 lineal feet; crossings, 1,120 lineal feet; grading, 30,300 cubic yards; granite, 51,800 square yards; hydraulic cement, 8,750 cubic yards; rolling, 54,500 square yards; readjusting manholes, 5; twelve-inch pipe, 500 lineal feet; paving street intersections, 800 square yards; paving street gutters, 200 lineal feet; rubble masonry, 50 cubic yards; covered gutters, 300 lineal feet.

The lowest bidders were G. Eyerman & Co., prices as follows: curbs, 5-inch, \$1.15 per foot, total, \$26,335; curbs, circular, 5-inch, \$2.30 per foot, total, \$1,035; curbs, reset, 4-inch, 5 cents per foot, total, \$10; curbs, reset, 5-inch, 5 cents per foot, total, \$5; curbs, reset, 6-inch, 5 cents per foot, total, \$5; crossings, \$7.15 per foot, total, \$3,580; gradings, 5 cents per cubic yard, total, \$15,015; granite, \$3.30 per square yard, total, \$170,940; hydraulic cement, \$4.70 per cubic yard, total, \$41,125; rolling, 5 cents per square yard, total, \$2,725; readjusting manholes, \$2 each, total, \$10; 12-inch pipe, \$1.50 per foot, total, \$750; paving street intersections, 50 cents per square yard, total, \$400; paving street gutters, 15 cents per lineal foot, total, \$30; rubble masonry, \$5 per cubic yard, total, \$250; covered gutters, \$1.50 per lineal foot, total, \$450; grand total, \$262,673.

The other bidders were: T. M. Steel, \$295,084.50; S. W. Ramp, \$290,000.10; M. J. Dady, \$270,108.50; E. Kirchner & Co., \$265,602; Folz, Ashmun & Co., \$369,300.50.

GLOUCESTER, PA.—J. P. Eyre & Co., of Philadelphia, have contracted to build a pier for the Gloucester Iron Works, at \$11,243.

WESTERLY, R. I.—The contract for laying the west side Shunoc-Water extension has been given to F. A. Snow.

BOSTON.—The commissioners on the new courthouse in Boston have received the following proposals for masonry work in the erection of the northerly section from the second floor level: Messrs. W. A. & H. A. Root, \$148,980.14; Woodbury & Leighton, \$145,659; Augustus Lothrop, \$142,257; Sampson, Clark & Co., \$139,909. The commissioners have the proposals under consideration.

Frank Blandell, of Lynn, has been awarded the contract to build a stone-arched bridge over State Street on the West Roxbury branch of the Boston and Providence Railroad, to replace the iron bridge that fell on March 14. The price to be paid is about \$60,000.

MINNEAPOLIS.—The Haxton Steam-Heating Co. has been awarded contract for steam-heating in school buildings at about \$50,000. Architect Pardee has submitted plans of the new school building, corner Sixth Street and Eighth Avenue South, to cost \$30,000.

BOSTON.—The City Engineer at noon on Thursday received the following proposals for repairing waterways of Congress Street bridge-draw: Josiah Shaw, \$11,007.90; J. N. Hayes & Co., \$12,000; Benjamin Young, \$11,840; W. A. Kenrick & Son, \$11,250; Alexander McInnis & C. W. Parker, \$10,568.43; F. G. Whitcomb, \$10,261. The contract was awarded to Mr. Whitcomb.

TRENTON, N. J.—On August 18 a contract for masonry work on the State Lunatic Asylum was given to F. S. Johnson at \$65,000, and a contract for carpenter work to James W. Lanning at \$28,000.

PORT HURON, MICH.—The following bids for a 5,000,000-gallon set of compound pumping machinery were received by the Board of Water Commissioner: August 15: George F. Blake Manufacturing Co., New York, \$23,920; Henry R. Worthington, New York, \$23,300; Dean Steam-Pump Co., Holyoke, Mass., \$22,033; Holly Manufacturing Co., Lockport, N. Y., \$19,000.

MINNEAPOLIS, MINN.—On August 15 Council Committee opened bids for constructing the Franklin Avenue bridge. Two sets of plans and estimates were bid on as follows: Plans A and C, King Bridge Co., Cleveland, O., \$81,500; Horace E. Horton, Rochester, Minn., \$80,000; Smith Bridge Co., Toledo, O., \$49,141; Schiffer Bridge Co., Pittsburg, \$81,605; Canton Bridge Co., Canton, O., \$89,000; Edgemoor Iron Co., New Jersey, \$90,500; Milwaukee Bridge Co., \$86,000; Minneapolis Bridge Co., \$83,468; Lowell & Curtiss, Pittsburg, \$81,900.

Plans B and D, King Bridge Co., \$78,000; Smith Bridge Co., \$80,248; Schiffer Bridge Co., \$79,300; Lowell & Curtiss, \$91,900; Canton Bridge Co., \$81,000; Minneapolis Bridge Co., \$81,318. The City Engineer will report.

GOVERNMENT WORK.

ABSTRACT of proposals opened Monday, August 15, by Major S. M. Mansfield, U. S. Engineers, for rebuilding the superstructure of crib-work surrounding the keeper's dwelling at Milwaukee, Wis., pier-head light-station:

Christopher H. Starke, Milwaukee, Wis., pine timber, 126,328 feet, B. M., per M. \$18; pine plank, 24,000 feet, B. M., per M. \$18; drift-bolts, 10,500 pounds, per pound 4 cents; spikes, 1,800 pounds, per pound 5 cents; stone ballast, 150 cords, per cord \$7.25; framing, 150,328 feet, B. M., per M. \$18; total, \$7,000.37.

William T. Casgrain, Milwaukee, Wis., \$17.90, 3 cents, 4 cents, \$7.90, \$16; total, \$6,668.12.

Hiero B. Herr & Co., Chicago, Ill., \$16, \$14, 4 cents, 5 cents, \$8, \$15; total, \$6,322.17.

MONTGOMERY, ALA.—The following bids for furnishing machinery for maneuvering lock-gates and culvert-gates on Coosa River were received by Captain R. L. Hoxie, U. S. Engineers, August 11:

Manly & Cooper Manufacturing Company, Philadelphia, Pa., \$1,700.

Montgomery Iron Works, Montgomery, Ala., \$4,100.

Synopsis of bids for iron columns and beams from third story to ninth floor of tower for Post-Office, etc., at Minneapolis, Minn., opened by the Supervising Architect, August 11: Dearborn Foundry Co., \$7,500; Clark, Raffin & Co., \$6,680.

WASHINGTON, D. C.—Bids for tin and tin-work on Pension Building opened August 8 by General M. C. Meigs, supervising architect:

Merchant & Co., New York, tin, per box, \$6.70; solder, per pound, 15½ cents, 15½ cents; nails, 5½ cents per pound.

Morgan, Thomas & Co., \$6.87½, \$7, \$7.12½.

Morgan, Thomas & Co., work, per square, \$2.87½.

J. W. Considine, work, per square, \$3.37½.

W. J. Ferguson, work, per square, \$2.

S. G. Bouis, work, per square, \$1.95; lowest for work.

J. B. Scott & Co., letter of explanation of bid.

A. Schultz & Co., solder, 14½ cents.

Fisher & Johnson, work, per square, \$4.45.

J. B. Scott & Co., tin, per box, \$6.12½; lowest for tin.

Thomas Binnix, work, per square, \$3.40.

Phelps, Dodge & Co., tin, \$6.50; solder, 15½ cents.

W. F. Potts & Co., tin, \$6.75.

W. F. Potts & Co., solder, 14½.

NAVY YARDS.—The Secretary of the Navy has directed that \$75,000 shall be expended at each of the navy yards at Brooklyn and Norfolk for men, tools, and plant.

WASHINGTON, D. C.—Contracts for building the cruisers and gunboats under bids recently opened by the Navy Department have been awarded as follows: Cruiser No. 3 (the Newark) to William Cramp & Sons, of Philadelphia, at \$1,248,000; Cruiser No. 4 to the Union Iron Works, of San Francisco, at \$1,428,000. Department's plans for hull and machinery.

Cruiser No. 5 (Similar to No. 4) to William Cramp & Sons at \$1,350,000, contractors plans for hull and machinery.

Two 1,700-ton gunboats to N. F. Palmer & Co., New York, at \$490,000 each, Department's plans.

WASHINGTON.—Captain James B. Quinn, United States Engineer, in his annual report recommends the appropriation of \$160,000 for expenditure the next fiscal year upon the Missouri River from Sioux City to Fort Benton.

ABSTRACT of proposals for bridge over the eastern branch of the Potomac River at Washington, D. C., opened by Major Peter C. Haines, U. S. A.:

Mt. Vernon Bridge Co., Mt. Vernon, O., \$148,000.

Mt. Vernon Bridge Co., Mt. Vernon, O., \$127,000, if iron structure be accepted.

Groton Bridge Mfg. Co., Groton, N. Y., \$105,000.

Pittsburg Bridge Co., Pittsburg, Pa., \$123,000.

Smith Bridge Co., Toledo, O., \$150,000.

Synopsis of bids for superstructure, roof, and floors of Post-Office, Court-House, etc., at Augusta, Me., opened by the Supervising Architect August 15:

Maine and New Hampshire Granite Co., Portland, Me., \$74,700.

Horace Purinton & Co., Augusta, Me., \$74,875.

Hallowell Granite Works, Hallowell, Me., \$72,797.

Mt. Waldo Granite Works, New York City, N. Y., \$79,000.

Note.—All stone granite, with coursed Ashlar, and No. 8 cut trimming, courses and groins.

THE SANITARY ENGINEER AND CONSTRUCTION RECORD.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 16. }
NUMBER 13. } PUBLISHED EVERY SATURDAY.

NEW YORK, AUGUST 27, 1887.
LONDON, SEPTEMBER 10, 1887.

THE BURIAL OF SEWAGE AND REFUSE.

AT tolerably regular intervals during the last ten years some one makes the discovery that the disposal of sewage by water-carriage is a bad thing, and proceeds to announce to the ignorant engineers who have been dealing with this problem that the true and only way to dispose of refuse and excreta is to follow Nature and bring it in contact with the earth as soon as possible. The latest specimen of this kind of instruction is contained in an address by Dr. G. V. Poore, of London, on "The Shortcomings of Some Modern Sanitary Methods," a title which has a curiously familiar aspect. He declares that the admixture of water with dead organic matters is wrong, because it is antagonistic to a law of Nature; because it disseminates disease; because it fouls water-supplies, etc., etc., and his remedy is to bury all excreta and refuse just beneath the surface of the ground.

Many things connected with civilization, and without which civilization is impossible, are antagonistic to a law of Nature in Dr. Poore's interpretation of that very vague and improper phrase. Most of his objections and criticisms relate to bad work, and there is just enough truth in them to make the address interesting to those who know little of the subject, but who want to prevent any action being taken in their own town or village, and will gladly seize on any argument which will prevent their being taxed for sewers.

By ignoring all questions as to the disposal of slop-water, by quietly assuming that the only thing which pollutes water is excreta, by refusing to consider the question as to how all refuse and excreta are to be buried in cities, and dealing only with the problem of scattered villages and cottages, it is possible to devise a great variety of schemes which can be made to appear more or less attractive. No one would suppose, from anything that appears in Dr. Poore's address, that the criticisms he makes had ever been made before, that the method he proposes had not been tried and found wanting, that its expense makes it impossible to carry out, or that his arguments about the value and importance of excreta as a fertilizer were not duly considered by engineers in every case where they have to deal with the problem of sewage disposal. He hardly even hints that in different localities different methods of disposal of refuse and excreta may be desirable, recognizes no difference in soils, has no reference to sewage irrigation—in short, nothing will do for him except to allow no water to be mixed with the excreta, and to bury these last in the ground near the house.

Such opinions and views would be of the smallest possible interest and importance to sanitary officials and engineers who have to deal practically with difficult problems of refuse and sewage disposal of towns and cities, were it not for the use made of them by ignorant demagogues to oppose efforts to secure sewerage for cities badly in need of it.

It is, however, about time that some such scheme as that of Dr. Poore's should appear; it has been a year or more since we have had one of this kind, and this one comes in time to assure us that the average crop of such literature is not yet falling off.

WELL-WATER.

THE great majority of the people in this country obtain their drinking-water from the moving sheet of water which lies at a greater or less depth beneath the surface of the earth, and for this purpose they use wells.

The questions as to how far, and under what circumstances, well-water may be dangerously contaminated, and how such contamination may be best recognized when present, or be foreseen and guarded against, are therefore of constant interest. The Journal of the Chemical Society for June, of this year, contains a paper by Robert Warington, entitled "A Contribution to the Study of Well-Water," which is of more than ordinary value and interest. In this paper is given the results of a continuous and systematic examination of the well-waters of Rothampsted, England, and of the connection between the composition of rain, drainage, and deep-well waters. Taking a series of observations for several years it was found that the rain contained, in a million parts, an average of two parts of chlorine, 0.67 part of combined nitrogen, and 2.52 parts of sulphuric acid. By drainage through five feet of bare soil the quantity of chlorine is not increased, but the combined nitrogen is increased about nine times by oxidation of the organic matter in the soil. The production of nitrates occurs chiefly in the summer months, and the first considerable drainage which occurs after summer will contain the greatest proportion of the nitrates.

Nitrates being assimilated by plants are generally absent in drainage from land bearing an actively growing crop. The proportion of chlorine in the purest wells at Harpenden is about eleven per million, and it varies very little. Wells in soil much contaminated by sewage may show the commencement of a rise in the chlorides one or two months after the active autumn drainage begins, and two months before the water-level in the well begins to rise. Wells little liable to contamination show a rise in chlorides later in the season. When soil has been long contaminated by sewage, and then fresh contamination ceases for a number of years, the proportion of chlorides in the well-water may be considerably higher than normal, but it will remain nearly unaltered through the drainage season.

In contaminated well-waters the proportion of nitrates and chlorides increases at first at an equal rate, but if active drainage continues the proportion of nitrates greatly increases. The sewage of a poorly-fed population gives a high proportion of chlorides to nitrates, while stable sewage causes the reverse. The chloride contamination is more permanent than that by nitrates. The probable average proportion of nitrogen as nitrates in drainage water from cultivated land is 3.8 per million.

The examinations of waters made by Mr. Warington were almost entirely chemical; the only exception was a series of experiments which indicated that a nitrifying micro-organism is contained in deep-well waters, but in very small proportions.

DEATH OF PROFESSOR BAIRD.

THE death of Professor Spencer F. Baird, the Secretary of the Smithsonian Institution, is a great loss to this country and to the world. He was born at Reading, Pa., February 3, 1823, and died at Wood's Holl, Mass., August 19,

1887. In his early life he was a naturalist and a teacher, but for the last thirty-seven years has been connected with the Smithsonian Institution, and has been the chief agent in forming its collections and in the organization of the National Museum. In 1871 he was appointed United States Fish Commissioner, and in that capacity has done most important work in increasing the food-supply of this country, and in determining the directions in which this kind of work may be profitably extended. For the last eight years he has been at the head of the Smithsonian Institution.

A large, powerful man, full of vitality and energy, it seemed as if he could not do too much or have too much to do; but it is to be feared that overwork was in part, at least, the cause of his death. He was solely devoted to science and scientific interests, was a member of many societies, and received many honors. He lived to see his work established on a firm foundation, and his death is regretted not only by all who knew him, but by many who never saw him.

MR. W. H. PREECE recently read a paper before the Society of Arts on "Fifty Years' Progress in Telegraphy." Speaking of underground wires, he says: "In London alone we have 255

as \$1,000 had already been paid down to bind the transaction. The agent was obliged to refund this sum. This is a very satisfactory result of the trouble taken to prepare the articles.

OUR BRITISH CORRESPONDENCE.

A Technical Instruction Bill—Tenth Annual Congress of the Sanitary Institute—Compressed Air for Working Electric Motors—Tight Fish Plates—Law Suit over a Brick Tank—American Metallic Packing in London—Underground Telephones.

LONDON, August 3, 1887.

A "TECHNICAL instruction bill" now before Parliament is creating considerable discussion. Its object is to authorize school boards to provide technical schools and instruction. Complaint is already frequently made that the education given at the board schools does not stop at the "three R's," but that a child attending there may obtain better education than can be afforded to his family by many a middle-class man who has to pay school-board rates. The prospect of an enhanced rate for the purpose of providing technical education to children of the artisan class is not, therefore, favorably received.

The tenth annual congress and exhibition of the Sanitary Institute will be held at Bolton in September, the congress taking place on the 20th to the 24th of Septem-

rails to expand under the great heat that we have lately experienced, causing them therefore to buckle up between the plates and distort the metals.

The Mersey Railway in its extension to join the Wirral Railway has met with several difficulties during its construction. An action has been brought against it by the Birkenhead Corporation in connection with fractures in a brick tank destined for a new gas-holder which the corporation have under construction. Mr. Woods, President of the Institution of Civil Engineers, and Sir James Brunlees gave evidence for the railway company, who, in this case, had a verdict awarded to them on the ground that the said fractures were not due to their work.

THE United States Metallic Packing Company have scored with their metallic packing with the London and South-western Railway, notwithstanding the fact that there are several metallic packings of English manufacture in the market. The locomotive superintendent of this railway states that it is giving every satisfaction and will effect a considerable saving in the way of piston-rods and cost of labor, while the glands do not require packing so frequently.

The first departure in the way of underground telephones has been made in the city where a small section has been laid down in Broad Street for the purpose of testing the system.

SAFETY-VALVE.

A STABLE AT WENTWORTH HALL, JACKSON, N. H.—W. A. BATES, ARCHITECT.

miles of pipe, containing 10,212 miles of wire. In fact, all our great trunk lines are out of danger of stoppage from storms. We have 868 miles of open wire included within the metropolitan area, but these are chiefly in the suburbs, and include long outlying sections, used either for police or fire brigade wires, or for private persons. There are 213 offices in London now served wholly by buried wires."

It appears that in 1886 there were in the United Kingdom 26,425 miles of overhead telegraph lines, embracing 150,590 miles of wire, and 677 miles of underground lines, with 19,605 miles of wire. It is estimated that to connect only the more important towns by underground wires, and "uniting those towns by less than half the existing number of overhead wires, would cost something like £2,500,000." Of submarine cable there are now 112,673 nautical miles, which has absorbed a capital of £37,000,000. The larger part of this, or 102,531 miles, is owned by 27 private companies, having from 1 to 53 cables each.

WE have learned that an exposure of bad plumbing in a certain dwelling which was recently made in this journal was the means of warning an innocent buyer against the purchase of one of a block of buildings which were not at the time fit habitations for human beings. The warning came just in time to prevent the purchase,

under the presidency of Lord Basing. There will be three sections: (1) Sanitary Science and Preventive Medicine, commencing September 21, the opening address by Prof. J. Russell Reynolds, M. D., F. R. S., F. R. C. P.; (2) Engineering and Architecture, September 22, opening address by Prof. T. Hayter Lewis, F. S. A., F. R. I. B. A.; (3) Chemistry, Meteorology, and Geology, September 23, opening address by August Duprè, Ph. D., F. C. S., F. R. S. Papers on the various subjects concerned are invited by the council of the institute.

A company has been formed in Paris for the purpose of supplying compressed air for working electric motors, obviating the necessity of engines, boilers, etc. Mains are being laid through Paris, connecting the various public buildings where it is intended to supersede gas by electric light, with a central station for compressing the air by engines of 3,000 horse-power (total). With such facility for driving the motors, and the safety consequent, electric-lighting will undoubtedly receive an impetus.

It has hitherto been supposed that tight fish-plates are an advantage. It would seem, however, from evidence given before a Board of Trade inquiry, appointed in the case of an accident, that such is not the case. An express train ran off the metals at a point where the rails had buckled up. Space had been left in the joint to allow for expansion, but it was discovered that the tightness of the Ibbotson's patent fish-plates had prevented the

THE MILWAUKEE SEWERAGE PROBLEM.

WE are glad to note that the Mayor of Milwaukee and the Board of Debt Commissioners have decided to act under the law passed by the last Legislature authorizing the expenditure of half a million dollars in measures for the relief of their river nuisance. It is to be hoped that the city officials, who seem to be infatuated with the idea of flushing the river, will conclude that the only sensible thing for honest and intelligent men to do is to secure the services of acknowledged experts in this branch of engineering to consult with their city engineers and then promptly authorize the execution of the plan such a commission will recommend.

OUR SPECIAL ILLUSTRATION.

OUR special illustration this week shows two views of the Lumber Exchange at Minneapolis, Minn., of which Messrs. Long & Kees were the architects.

OUR VIGNETTE ILLUSTRATION.

OUR vignette illustration this week shows the Wentworth Hall Stables at Jackson, N. H. The exterior is shingled in staves, and accommodates ninety horses, with boxes, etc. The cost of the structure was \$9,000. The architect was W. A. Bates, of 149 Broadway, New York.

LONG & KEES, ARCHITECTS.

THE ARCHITECTURAL LEAGUE'S JAUNT.

It was not a very happy lot of members of the New York Architectural League who went ashore from the steamer "Providence," of the old Colony Line, at Newport, at 5 A. M. of the 19th inst. They had not gone to bed early, most of them had slept but little, it was very early in the morning, and they were in the confines of a Prohibition State.

They tumbled into their carriages, however, and, after leaving bags, etc., at the Aquidneck, drove to the beach and tumbled into the surf, which, in its early morning strength, returned their blow with interest.

Just before this latter act the secretary—may he be perpetual—had produced a queer-looking nickel-plated instrument strongly resembling a conductor's bell-punch, but which he gravely assured every one was a detective camera, and after much posing and struggling and straddling about of the group of blue-clad, half naked subjects, he had sighted them, pulled a string—and they had become immortal.

Back to breakfast—a ceremony at which eight strongly-built colored men found it difficult to furnish food to appease voracious appetites.

Carriages at nine, and, after a long drive about the old town, the procession drew up at Mr. Cornelius Vanderbilt's house—formerly Mr. Lorillard's—and was received by Mr. Vanderbilt personally, who showed the points of interest.

Since buying the house he has added a new dining-room—a splendid apartment some 60x40 feet, finished in stained oak, but which is handicapped by an unfortunately designed ceiling. The breakfast-room—another alteration—is exceedingly nice, being a very simple treatment, with delicately-modeled plaster-work, the whole having an effect of a pleasant saffron yellow.

Then a walk about the grounds and into the children's house, though not before Mr. Vanderbilt had shown that prohibition laws were not universal.

From here, by foot along the sea-walk to McKim, Mead & White's house for Mr. Robert Goellet, at which some time was spent. Then to Mr. H. A. C. Taylor's house by the same architects. A nice treatment of an old colonial motive in white and pale pumpkin yellow, the interior very simple and quiet. Thence, by devious ways, to Mr. Samuel Coleman's house, which was perhaps the gem of those visited in Newport.

The exterior is very nice, while the interior, done in great part by the artist himself, is a most charming and delightful piece of color. The library is jewel-like.

From here to the Casino, where every one lunched and walked about until it was time to take the train for Boston, at which city all arrived at 5:40 P. M. and drove to the Parker House. About seven the representatives of the Boston Society of Architects arrived and all dined, and a very good dinner it was, interspersed with songs by the "sweet singer" and dialect tales by W. P. P. Longfellow. Mr. Rotch Ware set loose a flood of talk by some remarks upon architectural co-operation, and this was supplemented by Mr. Briggs in a few words on specialists, but by eleven o'clock everybody found that everybody else was of his mind and that early rising was not conducive to argument, and everybody said good-night and went to bed.

On Saturday morning carriages to Brookline, driving out through Commonwealth Avenue and the Back Bay, and after quite a journey to Mr. Harney's house for Mr. Schlessenger. A very nice house on the English country house plan, built some twelve years ago. Time was short, so with but a look here all arrived at the house which E. M. Wheelwright is completing for Mr. William Weld. A fine house on a splendid site, standing as it does on top of a hill, with far-reaching views in every direction. The house is very large, the first story of what are called "Tiffany" brick, with sills and lintels and a porch of a light stone. Above is all shingle-work, stained. The interior is very fine, the best, perhaps, of all those seen. It would be well worth while to describe the house in detail did space permit. The decoration of the drawing-

room was by Francis Lathrop, and there were two charming rooms by John L. Du Fais.

It was a dusty ride back to Boston with a stop at Trinity Church and a hurried visit to Kings Chapel, but by 2:45 every one was on the train for North Easton to see Mr. Richardson's work there.

Oliver Ames, 2nd, met us at the lodge and showed us over that and the house and grounds. Then to the Town Hall and the Library. All these works are so well known that a description is unnecessary. But a feast still remained in the memorial window which John La Farge designed for the village church. It is a perfect gem and glow of lovely color, and it was difficult to leave it and take the train which took us to Fall River and so back to New York early Sunday morning.

It was a most successful outing, all too short, and the league owes a debt of gratitude to its Committee on Current Work, who arranged it.

It is difficult to calculate the benefit which such excursions may work, binding as they must the widely-separated members of the profession, giving opportunity for comparison of methods and results, and fostering a feeling of friendly rivalry and emulation.

It is to be regretted that more members of the league did not avail themselves of the opportunity. Among those from the Boston society who dined on Friday were Messrs. Rotch Ware, E. M. Wheelwright, H. Langford Warren, and W. P. P. Longfellow, and among the number from New York were John L. Du Fais, the President; Charles I. Berg, Secretary; H. O. Avery, Warren R. Briggs, B. Collona, W. C. Hazlett, George Martin Huss, Charles R. Lamb, F. S. Lamb, Charles T. Mott, W. Rudolph O'Donovan, the sculptor; E. K. Rossiter, J. H. Taft, and F. A. Wright.

COSTLY DRAINAGE WORK IN NEW YORK DESTROYED.

GENERAL EGBERT L. VIELE made a statement to a New York *Tribune* reporter, that drains constructed on the west side of Central Park in this city at a cost of \$300,000 to remove the water from underground water-courses and make the locality fit for building sites are being closed up by builders in their building operations, thus destroying an important work and producing a dampness of building sites.

It is unfortunate that the Health Department has not now the power to control this matter. But the facts are that a law was passed by the Legislature some years ago authorizing the Department of Public Works to construct drains within the city limits whenever so directed by the Health Department.

Under this law large areas were drained on the east and westerly sides of the city; but the authority to enter private property for this purpose was contested by some property owners in the court, which decided in their favor, throwing the whole expense on the city. The authorities therefore consider themselves powerless to control these drains. May be Mayor Hewitt can institute an inquiry that will result in a way being found to stop this mischievous work.

PRIVATE WATER COMPANIES.

MR. H. F. DUNHAM, the writer of the paper upon "Private Water Companies," read at Minneapolis and briefly referred to in our issue of July 23, desires us to say that one sentence in our notice might lead to a wrong impression. Our report stated that the writer "took general ground in favor of private companies when ordinances were properly guarded." The paper which we published in the issue of July 30, it will be seen, was limited to a discussion of the relations often existing between private companies and municipal authorities, and no opinion as to the comparative merits of company and city works was expressed.

THE Chicago, Santa Fe and San Francisco Railroad bridge at Sibley, Mo., will consist of three spans of 400 feet each, one span 250 feet, one span 200 feet, and two spans of 175 feet each, making the entire length of the main structure 2,000 feet. It will be approached on the north side by an iron trestle 900 feet long, and a wooden trestle 3,700 feet long, making the entire length of the bridge and approaches 6,600 feet.

AFTER a number of months' trial the system of "building-permit fees" has been abolished at Minneapolis, and a resolution will come up before the city council recommending that all fees paid in during the trial have been in force be refunded.

PAVEMENTS IN THE CITY OF LONDON.

FROM the last report of Mr. William Haywood, Engineer of the city, which, it must be remembered, is a small portion only of the great metropolis, we gather some interesting items as to the present ideas of the English engineers on pavements.

The carriageways on portions of three streets have been laid with Val de Travers compressed asphalt. Another street which had been paved with Henson's wood pavement was also relaid in the same asphalt, the wood having become in bad condition.

Four streets had been laid with Limmer compressed asphalt. Two others which had been paved with wood, and were in bad condition, were also relaid with the Limmer asphalt.

Wood pavement was renewed in three streets and parts of streets.

Granite was used in two streets, but the "relaying of streets with granite diminishes yearly, wood and asphalt (principally the latter) gradually being substituted for granite in the city."

For footways Val de Travers compressed asphalt was used in four streets, Limmer asphalt in six streets, and stone in five streets.

The whole of the carriageways are swept once daily, and the main thoroughfares, in wet weather, swept a second time during the day.

In addition to the general cleansing of the whole surface, the street orderly system was in operation on the carriageways of all the main thoroughfares, about 150 boys being employed for that purpose. The great advantage of this street orderly system is most apparent in wet weather, the thoroughfares where they are employed being at such times in a much greater state of cleanliness than they are elsewhere.

The work of cleansing the main thoroughfares often begins as early as two, three, or four o'clock in the morning. The street orderlies then take up the work at about 7:30 A. M., and cease work at about 4:30 P. M.; late in the evening, when the weather permits, or the condition of the surface renders it necessary, the carriageway pavements are washed. The cleansing of the carriageways in the main streets is, therefore, almost continuously going on.

The quantity of water used during the year 1886, for washing the streets and courts, was about 2,247,790 gallons. The number of nights when the water was used was 88.

The footway pavements are swept by the Commission whenever it is necessary, and in wet weather those in the main thoroughfares are cleansed with squeegees during the day. It is a statutory obligation on the part of the occupiers of property to keep the footways clean in front of their premises, an obligation but little attended to by the inhabitants in any part of the city.

The courts and alleys inhabited by the poorer classes were washed with jet and hose twice a week between May and the end of October. A very few places are washed nightly throughout the year for special reasons.

The street orderlies and scavengers have for some years been occupied at times in strewing sand and gravel upon the streets which have the greatest traffic. The average quantity so strewn during the last three years has been about 650 cubic yards, and the tendency is for it to increase. The extra work in removing this quantity of material when converted into mud is, in some states of the weather, very great indeed, especially from wood pavements. This circumstance also adds to the difficulty of keeping the streets clean, as well as to the cost of cleansing.

The engineer complains of the troubles arising from the collection of house refuse, owing to the abuse of the privilege allowed of placing their dust and refuse on the footways in receptacles of insufficient size, or with none at all.

THE Passaic, N. J., City Council proposes to establish a city board of health. The method of organization is under discussion.

THE Wheeling, W. Va., Citizens' Railway Company has begun the introduction of electro-motors for its street-cars, with the expectation of reducing running expenses.

THE MOLTENO RESERVOIR AT CAPE TOWN, AFRICA.*

ALTHOUGH the subject of this paper does not deal with anything striking or original, it may be interesting as the history of the failure of a reservoir, and the measures taken for its repair, as it is often the case that failures afford valuable information, however dearly bought.

Cape Town cannot be regarded in the same light as large manufacturing towns in England, yet its importance as a coaling and military station must be considered. Soldiers and ships require a supply of water which would almost equal the amount necessary for manufacturing purposes, especially in a town of 35,000 inhabitants, while in a tropical climate, anything like a water-famine would lead to greater distress than in a more temperate latitude.

Abundance of water of the purest description should be available, the rainfall fluctuating between 24 inches in depth on the north-west, and nearly 50 inches on the south-east around Table Mountain.

The largest sources of water-supply lie at a considerable distance up Table Mountain.

Nearly all the rainfall occurs in the months of May, June, July, and August: it is therefore absolutely necessary to have some large impounding reservoir to hold at least 100 days' supply.

As is usually the case with towns in their infancy, Cape Town was originally supplied by wells and pumps, each person obtaining the water in buckets or barrels. In 1819 a small reservoir was constructed at the foot of Table Mountain holding 223,251 gallons, and the water from Platte Klipp formed the source of supply. In 1852 a second reservoir was constructed holding 2,337,834 gallons, and in 1860 a larger one was added capable of holding 12,500,000 gallons. As the town extended in area and increased in importance, it was found that these reservoirs were of insufficient capacity for the wants of the population, and that they also lay so low as to preclude the possibility of supplying the higher portions of the town that had sprung up in prosperous times. Under these circumstances it was determined to build a new reservoir, at an elevation that should command the whole town, and of such a size as to give an ample supply of water to the population, and to the shipping during the dry season.

A scheme was devised for the construction of a reservoir above the two existing ones at an elevation of 300 feet above the level of the sea, capable of holding 50,000,000 gallons. See Fig. 1.

The soil where the reservoir is excavated is a red sandy clay-earth formed by debris from Table Mountain, and is traversed by quartz bands and earth-washings brought down by heavy rain; it dissolves rapidly under the action of water, leaving a deposit of 90 per cent. of sand. Veins of quartz extend from south-east to north-west, a few of which were found in the ground excavated for the reservoir. One peculiarity of the soil is, that it stands almost vertically until attacked by water, which rapidly cuts furrows in it, soon assuming large proportions. The author found it easy to tunnel through this earth without timbering in dry weather, but as soon as rain came it had to be supported.

The reservoir was designed and constructed under the supervision of Mr. J. Tennant, the contractor being the late Mr. James, and was completed on the 1st of March, 1881.

The reservoir is situated at the base of Table Mountain. It is 1,000 feet long by 300 feet wide and 50 feet deep, partly built by excavation, and partly by embankments round three sides. No water was available for the reservoir until the 4th of May, owing to the supply-works not having been completed before the end of the rainy season. When the water had reached a depth of one foot six inches at the outlet works or valve-shaft, which was situated in the eastern embankment, one of the wing-walls leading to the valve-shaft, or tower, fell over (see Fig. 2), drawing a portion of the shaft with it. These wing-walls were merely revetment walls, and were not built as retaining-walls, although it must have been evident they would be subject to considerable pressure. Mr. Swallow, the City Engineer, then proposed to abandon the greater portion of the wing-walls, and to construct a culvert from the valve-shaft to a forebay in the reservoir. The work was completed and an official opening took place on the 21st of July, 1881.

When a depth of ten feet of water was subsequently obtained, a leak was discovered in the tunnel; the water was thereupon run off, and a portion of the puddle removed from the back of the valve-shaft, and on the culvert being reached a gap was found over the top of the arch of the outlet-culvert large enough for a man to creep into. This chasm was filled up by running in puddle, a very unsatisfactory proceeding, as it had to be driven in horizontally, and with insufficient space in which to work.

* By Charles John Wood, M. Inst. C. E., in proceedings of the Institution of Civil Engineers.
